Hammer-headed Shark (*Zygœna malleus*). An extremely ugly fish of the Shark family, distinguished by the extraordinary form of its head, which in the adults resembles a double-headed hammer, being extended on both sides to a considerable length and having the eyes at the ends of the lateral extensions. The mouth is below the centre of the head. In the young the hammer-headed form is not so perfect.

Hammock. A suspended bed invented by Alcibiades; the name is derived from *hamac* (which see). It consists of a strip of canvas about 3 feet wide and 6 feet long, to the ends of which are attached combinations of small cords, called *clews*. When suspended, this canvas forms a receptacle for a mattress and blanket; when not in use, the canvas is wrapped tightly around the bedding and bound with a lashing and stowed in the nettings. Each man on board ship has two hammocks, the one not in use being kept clean and stowed away in the sail-room; the watch number of the owner is stenciled on the hammock, and also on a tin tag hung over the proper hook. *Up all hammocks*, the order to take the hammocks on deck and stow them in the nettings. *Down all hammocks*, the order to lash the hammocks and stow them below, when for any reason, such as rain, they cannot be taken on deck. *To sling a hammock*, to bend the clews and get it ready for use. *To swing a hammock*, to hang it up on the hooks.

HAMMOCK-CLOTH. A painted canvas cover over the netting to protect the hammocks from the weather.

HAMMOCK-GIRTLINES. Lines extending from the jib-boom to the spanker-boom, on which scrubbed hammocks are stopped to dry.

HAMMOCK-NETTINGS. Receptacles on the rail for hammocks when not in use. They were formerly formed of net-work, hence the name. They are now boarded in.

HAMMOCK-STANCHIONS. Iron stanchions fixed on the main-rail or plank-sheer, having a forked end to which the hammock-rails are secured.

Hamper. Articles which, though ordinarily indispensable, are a great inconvenience at certain times. See TOP-HAMPER.

Hamron. An archaic term meaning the hold of a ship.

Hance. A sudden fall or break.

Hand. An adjective applied to anything worked by hand. A man; one of the crew. *All hands*, everybody. *Bear a hand*, to make haste. *Lend a hand*, to assist. *Hand-over-hand*, hauling rapidly upon any rope, by passing the hands alternately one before the other, or one above the other if hoisting. A sailor is said to go *hand-over-hand* if he lifts his own weight and ascends a single rope without the help of his legs. *Hand-over-hand* also implies *rapidly;* as, we are coming up with the chase hand-over-hand. *Hand-under-hand*, the manner of descending a rope, the weight of the body being sustained by the arms only. *Hand-taut*, as taut as can be hauled by hand. *To hand* a sail, to furl it.

HAND FEED-PUMP. A feed-pump provided with brakes so as to enable it to be worked by hand independent of other motive force.

HAND-GEAR. An appliance for manipulating a steam-engine or other machine when automatic action is not desired.

HAND-GRENADE. A shell, weighing about 2 pounds, thrown from the hand. The fuze being previously lit, the shell is conveniently thrown from the tops on to an enemy's deck, from the parapet into the ditch, or generally against an enemy otherwise hard to reach. Ketchum's hand-grenade is a small oblong percussion-shell, which explodes on striking the object.

HAND-GUN. An old term for small-arms in the times of Henry VII. and VIII.

HAND-HOLE. A small elliptical or triangular hole in any convenient part of the shell of a steam-boiler; used for cleaning and repairing the structure and withdrawing scale or sediment from the interior. It is covered by a *hand-hole plate*.

HAND-LEAD. A small lead used for sounding in shallow water.

HANDMAID. An old denomination for a tender; thus, in Drake's expedition to Cadiz, two of her Majesty's pinnaces were appointed to attend his squadron as *handmaids*.

HAND MAST-PIECE. A small hand mast-spar.

HAND MAST-SPAR. A round mast; those from Riga are commonly over 70 feet long by 20 inches diameter.

HAND-PUMP. The common movable pump for obtaining fresh water, etc., from tanks or casks.

HAND-SAW. The smallest of the saws used by shipwrights, and used by one hand.

HAND-SCREW. A handy kind of single jack-screw.

HANDSPIKE. A short wooden lever for moving heavy articles, as guns.

HANDSPIKEMAN. One of a gun's crew who handles the handspike in great-gun drill.

Handle. The title prefixed to a person's name. *To handle a ship well* is to work her in a seaman-like manner.

Handsomely. Slowly; steadily; carefully.

Handy, Robert, Commodore U.S.N. Appointed a midshipman from Rhode Island, February 1, 1826; sloop "John Adams" and frigate "Constellation," West India Squadron, 1826–27; frigate "Hudson," Brazil Squadron, 1828–31.

Promoted to passed midshipman, April 28, 1832; survey of Narragansett Bay, 1832; sloop "Vincennes," Pacific Squadron, 1833–35; frigate "Brandywine," Pacific Squadron, 1835–37.

Commissioned lieutenant, March 8, 1837; sloop "Erie," Home Squadron, 1838; navy-yard, Boston, 1838–40; steamer "Fulton," special service, 1841–42; sloop "Levant," Pacific Squadron, 1843–47; receiving-ship, Boston, 1847–48; navy-yard, Boston, 1848–52.

Commissioned commander, September 14, 1855; commanding rendezvous, Boston, 1858–61; commanding "Vincennes," Gulf Squadron, 1861; commanding "Dale," East Gulf Blockading Squadron, 1863–65. Retired, 1862.

Commissioned commodore, March 13, 1867.

Handy-billy. A small jigger used for various purposes about the decks, in the tops, holds, etc.

Handy Ship. One that works easily.

Hang. To droop in the middle part. To linger; to stop temporarily; as, a vessel *hangs* on the ways. To incline; as, a mast *hangs* aft. To support temporarily from above; as, to *hang* the bight of a chain. *To hang on*, to persevere; to continue. To throw the whole weight on a rope or tackle; to hold on. The hanging of sheer-strakes and decks is the declining in the centre of the length fore and aft, from a level or horizontal line.

HANG FIRE. When there is an unusual slowness in the ignition of the gunpowder of a piece or train it is said to *hang fire*. Used figuratively to indicate hesitation.

HANGING-BLOCKS. Blocks under the eyes of the fore-topmast rigging, through which reeve the jib- and stay-sail-halliards.

HANGING-BRIDGE. An inverted *fire-bridge* or *bridge-wall*, placed in a furnace or flue for the purpose of deflecting the flame and other products of combustion downwards. See FIRE-BRIDGE.

HANGING-CLAMP. A semicircular iron with a foot at each end by which it is secured to any part of the ship to receive nails; it is not often used nowadays.

HANGING-COMPASS. A tell-tale; a compass so constructed and swung as to hang with the card downwards.

HANGING-KNEES. Those knees against the sides and beams whose bodies are perpendicular and whose arms extend under the beams at right angles with the bodies of the knees.

HANGING-STAGE. A stage rigged outside the ship, supported by ropes from above.

HANGING STANDARD-KNEES. Vertical curves employed generally with the orlop beams; they are fastened on each side against the vertical side of the beam, and on the other side against the ship's sides; thus they differ from those which are simply called standard.

HANGING-STOVE. A vessel suspended from a beam and containing fire for drying the decks.

Hank. A ring of rope, wood, or iron, running on a stay, and to which is seized the luff of a stay-sail. Also, a skein of line or twine. *Hank-for-hank*, an expression to denote that anything is done slowly and laboriously.

Han-Kow. A city and one of the treaty ports of China, on the Yang-tse-Kiang, at the mouth of one of its tributaries, and 700 miles from the sea. The city, with Han-Yang and Woo-Chang, the capital of Hoo-Pe, all in sight of one another, separated only by the river, forms one of the greatest commercial centres of the world. Lat. 30° 30′ N.; lon. 114° E.

Happy-go-lucky. An expression to signify a reckless reliance on chance.

Haque. A small hand-gun of former times.

Haquebut. A larger sort of hand-gun than the haque; an arquebuse.

Harbor. A general name for any safe port. The requisite qualities of a good harbor are, that it should afford security from the effects of wind and sea; the bottom should be free from rocks, wrecks, and shoals, and the holding-ground should be good; the opening should be sufficient to permit the entrance and departure of the largest vessels at all stages of the tide; there should be suitable establishments for the repairing and refitting of vessels; a sufficient number of warping-buoys should be planted; it should be well surveyed, well lighted, and well defended; and water, fuel, and provisions should be abundant and convenient. Such a harbor, if used as a place of commercial transactions, is called a port.

HARBOR-DUES. See PORT-CHARGES.

HARBOR-GASKET. See GASKET.

HARBOR-MASTER. An officer appointed to inspect the moorings, and to see that the ships are properly berthed, and the regulations of the harbor strictly observed by the different ships frequenting it.

HARBOR-REACH. The reach or stretch of a winding river which leads direct to the harbor.

HARBOR-WATCH. See ANCHOR-WATCH.

Hard. Firm; solid. Vehemently; with force. Cruel; oppressive. Inflexible; unyielding. Distressful; unprofitable. The word *hard* applied to the helm means "to the extreme limit." See HELM.

HARD BARGAIN. A useless officer; a skulking seaman.

HARD FISH. A term applied to cod, ling, haddock, etc., when salted and dried.

HARD-HEAD. The *Clupea menhaden*, an oily fish, taken in immense quantities and used for manuring land. The name is sometimes given to the sea-scorpion and the gray gurnard.

HARD-HORSE. A tyrannical officer.

Hards. See ACUMBA.

Harle. Mists or thick rolling fogs from the sea. Also a name of the goosander, *Mergus mergauser* (which see).

Harlequin Duck (*Clangula histrionica*). A species of garrot which receives its name from its variegated markings. It is found in the arctic regions, and in winter comes as far south as the Bay of Fundy.

Harmattan. A Fantee name for a singular periodical easterly wind which prevails on the west coast of Africa, generally in December, January, and February; it is dry, though always accompanied by haze, the result of fine red dust suspended in the atmosphere and obscuring the sun; this wind is opposed to the sea-breeze, which would otherwise blow fresh from the west on to the land.

Harmony of the Spheres. The ancients supposed the motions of the stars and planets to produce a kind of music, which they called the *harmony of the spheres*.

Harness. An old term for the furniture of a ship.

Harness-cask. A large conical tub for containing the salt provisions intended for present consumption. Alluding to the beef, which is often called salt-horse, it has been described as the tub where the horse, and not the harness, is kept.

Harp-cock. An old modification of the harpoon.

Harpins. A continuation of the ribbands at the fore and after extremities of the ship, fixed to keep the cant-frames, etc., in position until the outside planking is worked.

Harpoon, or Harpago. A spear or javelin with a barbed point, used to strike whales and other fish. The harpoon is furnished with a long shank, and has at one end a broad and flat triangular head, sharpened at both edges so as to penetrate the whale with facility, but blunt behind to prevent its cutting out. To the other end a fore-ganger is bent, to which is fastened a long cord called the whale-line, which lies carefully coiled in the boat in such a manner as to run out without being interrupted or entangled. Several coils, each 130 fathoms, of whale-line (soft laid and of clean silky fibre) are in readiness; the instant the whale is struck the men cant the oars, so that the roll may not immerse them in the water. The line, which has a turn round the bollard, flies like lightning, and is intently watched. One man pours water on the smoking bollard, another is ready with a sharp ax to cut, and the others see that the line runs free. Seven or eight coils have been run out before the whale "sounds," or strikes bottom, when he rises again to breathe, and probably gets a similar dose.

HARPOON, GUN-. A weapon used for the same purpose as the preceding, but it is fired out of a gun, instead of being thrown by hand; it is made entirely of steel, and has a chain or long shackle attached to it, to which the whale-line is fastened. Greener's harpoon-gun is a kind of wall-piece fixed in a crutch, which steps into the bow-bollard of the whale-boat. The harpoon projects about four inches beyond the muzzle. It consists of its barbed point attached to a long link, with a solid button at its opposite end to fit the gun; on one rod of this link is a ring which runs to the muzzle, and is there attached to the whale-line by a thong of seal- or walrus-hide, wet. The gun being fired, the harpoon is projected, the ring sliding up to the button, when the line follows. Some of these harpoons or other engines have grenades, —glass globules with prussic acid or other chemicals, which sicken the whale instantly, and little trouble ensues.

HARPOONER, HARPONEER, or HARPINEER. The expert bowman in a whale-boat, whose duty it is to throw or fire the harpoon.

Harp-seal. The *Phoca grœnlandica*, a species of seal from the Arctic seas; so called from the form of a dark-brown mark upon its back.

Harp-shell (*Harpa*). A genus of gasteropodous mollusks of the whelk family. The shells are much prized on account of their great beauty.

Harr, or Harl. A cold, thick mist or fog in easterly winds; the *haar*.

Harriot, Thomas. A man of high repute as an algebraist and astronomer. He accompanied the expedition to Virginia, under Sir Richard Grenville, in 1585, and wrote an interesting account of its transactions. He made a careful examination of the natural productions of the Carolinas and Virginia, and was the first to introduce tobacco and the potato to the knowledge of Europe. Harriot tried also to explain the doctrines of the Bible to the Indians of America, but because of the little community of language between the two races his missionary efforts were unproductive.

Harrison, Napoleon B., Captain U.S.N. Born in Virginia, February 19, 1823; died at Key West, Fla., November 1, 1870. Midshipman, February 26, 1838; lieutenant, January 6, 1853; commodore, July 16, 1862; captain, April 28, 1868. Served in California during the Mexican war; commanding "Cayuga," flag-ship of Capt. Bailey, and led the line in passage of Forts Jackson and St. Philip to the city of New Orleans, and specially commended for gallantry and skill in official reports; commanding steamer "Mahaska" in James River Flotilla; steam-frigate "Minnesota," North Atlantic Blockading Squadron, 1862–63; attached to South Atlantic Blockading Squadron, 1863–65, and took part in the operations on the South Carolina coast up to the fall of Charleston; commandant of midshipmen, Naval Academy, Annapolis, 1868–69.

Harry-net. A net with such small meshes and so formed as to take even the young and small fish.

Hartlepool, Durham County, England, 19 miles E.S.E. of Durham, is situated on an isolated promontory on the North Sea. The promontory curves so as to form a natural harbor, and presents from its high and singularly excavated cliffs magnificent sea and land views. It has a large export trade in coals, and imports Baltic produce, wools, and other staples. Pop. 13,200.

Hartstene, Henry. Born in South Carolina; died in Paris, March 31, 1868. Midshipman, April 1, 1828; lieutenant, February 23, 1840. He was in 1851 attached to the coast survey, and afterward commanded the mail-steamer "Illinois." In 1855 he was sent to the Arctic regions in search of Dr. Kane and his party, whom he rescued and brought to New York. In 1856 he was ordered to convey to England the British exploring-bark "Resolute," which, after having been abandoned in the Arctic ice, had been rescued by a New London whaler, and purchased of her salvors by Congress as a present to the British government. He was afterwards employed in taking soundings for the Atlantic telegraph cable. At the outbreak of the civil war he resigned, entered the Confederate navy, and in the summer of 1862 became insane.

Harvest-moon. The full moon nearest the autumnal equinox, when for several successive evenings she rises at the same hour; this name is given in consequence of the supposed advantage of the additional length of moonlight to agriculture.

Harwich. A seaport town in Essex County, England. The harbor is among the best on the east coast of England, and is defended by a strong fort and battery. Considerable ship-building is carried on, and it has large manufactories of cement. Pop. 6100.

Harwood, Andrew Allen, Rear-Admiral U.S.N. Born in Pennsylvania, and appointed midshipman from same State, January 1, 1818; served in the gun-brig "Saranac," on the Amelia Island Station, 1818; sloop-of-war "Hornet," 1819–21, during which time said ship was chiefly engaged in cruising for the suppression of the African slave-trade, and of piracy in the West Indies; navy-yard, Philadelphia, and receiving-ship "North Carolina," in 1822; steamer "Sea-Gull" and barges belonging to the expedition under Commodore Porter, against the West India pirates, 1823; on July 3, of that year, assisted in the capture of the piratical schooner "Catalina," of 3 guns, and her barge, by the barges "Gallinipper" and "Musquito" in Signapa Bay; frigate "Constitution," in the Mediterranean, 1824–27,—in the latter part of this service as acting master.

Commissioned as lieutenant, March 3, 1827; receiving-ship, Philadelphia, 1828–30; navy-yard, New York, 1831–32; frigate "United States," Mediterranean Squadron, 1832–33; detached as special messenger to bring home the ratified treaty with Naples; frigate "Potomac," schooner "Shark," and frigate "Constitution," Mediterranean Squadron, 1835–37; New York Station on special service, 1840–43; assistant inspector of ordnance, 1843–52; in 1844, member of a commission to visit dock-yards and foundries in England and France, and report on ordnance improvements.

Commissioned as commander, October 2, 1848; in 1851–52, member of a board appointed to prepare the ordnance instructions for the navy, and to make the necessary investigations and experiments; commanded frigate "Cumberland," Mediterranean Squadron, 1853–55.

Commissioned as captain, September 14, 1855; inspector of ordnance, 1858–61; member of a board to revise the ordnance instructions, and prepare a new edition.

Commissioned as chief of the Bureau of Ordnance and Hydrography, August 6, 1861.

Commissioned as commodore, July 16, 1862; commandant navy-yard, Washington, and of the Potomac Flotilla, 1862–63; secretary Light-House Board, and member of Examining Board, 1864–69.

Commissioned as rear-admiral, February 16, 1869; member of Retiring Board and on special duty at Washington, 1869–72; retired October 9, 1864.

Hasega. A corruption of *asseguay*.

Hask. An archaism for a fish-basket.

Hasp. A semicircular clamp turning in an eye-bolt in the stem head of a sloop or boat, and fastened by a forelock in order to secure the bowsprit down to the bows.

Hastan. The term for a large eel or conger.

Hastings. One of the Cinque Ports of England, in Sussex County, on the English Channel. The town formerly had an extensive trade, fine

docks, and ship-yards, but is now chiefly noted as a bathing-place. Pop. 29,500.

Hasty-pudding. A batter made of flour or oatmeal stirred in boiling water, and eaten with molasses or sugar.

Hatch. A half door. A contrivance for catching salmon. Any aperture in the deck, more than two feet square; a hatchway. A covering for a hatchway. *To batten down the hatches*, to place tarpaulins over them and secure the tarpaulins with nails and battens. *Under hatches*, a term for being under suspension or arrest,—applied to officers.

Hatch-boat. A sort of small vessel known as a pilot-boat, having a deck composed almost entirely of hatches.

Hatch-rings. Rings to lift the hatches by, or replace them.

Hatchway. See HATCH.

HATCHWAY-STOPPER. See STOPPER.

Haul. To pull; to drag. The wind *hauls* when it changes its direction with the sun. A ship is *hauled up* when her course is so changed that her head lies nearer the wind. A ship *hauls her wind* when from sailing large she is brought by the wind. *To haul off*, to remove to a greater distance. *To haul aboard a tack*, to bring the weather-clew of a course down to the tack-block; to set the sail.

HAUL-BOWLING. An old name for an able-bodied seaman.

HAULING-DOWN VACANCY (*Eng.*). The colloquialism expressive of the promotion of a flag-lieutenant and midshipman on an admiral's hauling down his flag at the expiration of a cruise. This custom is now obsolete.

HAULING-LINE. A light line sent down from a yard, top, etc., to which a small article is bent to be hauled up.

HAUL-YARDS. See HALLIARDS.

Haunch. A sudden fall or break, as from the drifts forward and aft to the waist. The same as *hance*.

Havana. The capital city of Cuba, the largest of the West Indies group of islands. Lat. 23° 9′ 4″ N.; lon. 82° 22′ W. Pop. 206,000. The harbor is capable of holding a thousand large ships, and is defended by the Morro and Punta castles and other fortifications. Havana is chiefly noted for its cigars, which have universal celebrity. The trade is mainly with the United States, and steamers ply constantly between Havana, New York, New Orleans, Galveston, Baltimore, and Philadelphia.

Haven (Anglo-Saxon, *hæfen*). A safe refuge from the violence of wind and sea; much the same as harbor, though of less importance. A good anchorage rather than a place of perfect shelter.

Havenent. A small haven.

Haven-screamer. The sea-gull, called *hæfen* by the Anglo-Saxons.

Havre, in Seine-Inférieure, France, at the entrance of the Seine into the English Channel. Lat. 49° 29′ 16″ N.; lon. 0° 6′ 9″ E. The fortifications are very extensive and complete. The harbor contains five large basins, not including the outer port. Among the principal institutions are a school of navigation and one of geometry as applied to the arts. A great number of sailing-vessels and steamers are fitted out at the building-yards here. Havre is the port of Paris, and regular lines of steamers ply between here and New York, Havana, Brazil, Calcutta, and China. Pop. 92,100.

Hawke, Edward (Baron). A British admiral of high repute. Before he had completed his twentieth year his talent and conduct procured him the command of a ship. At Toulon, in 1749, he broke the line of a Spanish fleet and captured one of the ships of the enemy. But as in this he had violated orders he was sentenced to dismissal by a court-martial. George III. restored him, as he was too valuable an officer to be turned adrift for an error in judgment. Naval history credits Hawke with two or three victories over the French, the most remarkable of which was gained in Quiberon Bay. An invasion of England was meditated in 1759, but Hawke, by his promptitude and daring, anticipated the event. He rose to be a vice-admiral, first lord of the Admiralty, and a member of the peerage.

Hawk's-bill (*Chelone imbricata*). A well-known turtle frequenting the Atlantic and Indian Oceans, so named from having a small mouth like the beak of a hawk; it produces the tortoise-shell of commerce. The flesh is indifferent, but the eggs very good.

Hawse. The situation of the cables when the ship is moored with an anchor on each bow. That portion of a vessel's bow through which the hawse-holes are cut. *In the hawse*, or *athwart the hawse*, a short distance in advance of the cut-water. A ship has a *bold hawse* when the hawse-holes are high out of water. *To freshen the hawse*, to veer out a little more cable and bring the chafe and strain on another part. To ride *hawse-fallen* is to ride at anchor with the water coming in at the hawse-holes carrying everything before it. Riding *hawse-full*, pitching bows under. The hawse is *clear* when both chains lead direct to their respective anchors, and either anchor can be picked up without fouling. When the hawse is clear, and the ship brings a strain on both chains, her head bisecting the angle between them, the hawse is *open*. When the chains are so crossed or intertwined that the hawse must be cleared before the anchors can be hove up, the hawse is *foul*. If from an open hawse a ship swings 180° she brings a *cross* in the hawse, a second half-swing in the same direction makes an *elbow*, a third, a *round turn*, a fourth, a *round turn and an elbow*, and so on. The hawse should be cleared before the turns accumulate to such a degree as to render the operation difficult. In the days of rope-cables, clearing hawse was a tedious operation, but chain-cables, with their shackles at every 15 fathoms, enable it to be done much more rapidly. A cross cannot be cleared; when unmooring in such a case the anchor to the under chain must be hove up first; if necessary to heave up the other anchor first, one of the chains must be unshackled and *dipped*. If the mooring-swivel be used, the hawse never gets foul, but there are some objections to its use. See MOORING-SWIVEL.

HAWSE-BAG. A canvas bag filled with oakum, used in heavy seas to stop the hawse-hole and prevent the water coming in. See JACK-ASS.

HAWSE-BLOCK. A buckler or piece of wood made to fit over the hawse-hole when at sea to back the hawse-plug.

HAWSE-BOLSTER. Pieces of oak timber fayed to the curvature of the bow under the hawse-

holes to prevent the cables from damaging the lower cheeks. They are generally ironed.

HAWSE-BOXING, or NAVAL HOOD. Hawse-boxing is not used nowadays; it was formerly a projection left upon the hawse-timbers in the wake of the hawse-holes, the thickness of the planking inside and outside against which the planking butted. The purpose of boxing is now answered by the use of a lead pipe turned down and secured inside and outside.

HAWSE-BUCKLER. See BUCKLER.

HAWSE-FULL. *Riding hawse-full*, pitching bows under.

HAWSE-HOLES. The holes at the fore part of the ship through which the cables pass.

HAWSE-HOOK. The breast-hook over the hawse-holes.

HAWSE-PIECES. Pieces in the frame, to the number of from three to six, next aft of the knight-heads, through which the hawse-holes are cut.

HAWSE-PIPES. Iron pipes fitted in the hawse-holes to prevent the cable from cutting the wood; a lead lining is placed under the iron pipes.

HAWSE-PLUG. A block of wood made to fit into the hawse-pipe, and put in from the outside to stop the hawse, and thereby prevent the water from washing into the manger. The plug, coated with old canvas, is first inserted, then a mat or swab, and over it the buckler or shield, which bolts upward and downward into the breast-hooks.

HAWSE-TIMBERS. The upright timbers through which the hawse-holes are cut.

HAWSE-WOOD. A general name for the hawse-timbers.

Hawser. A rope 11 inches or less in circumference, being composed of three plain-laid ropes laid up left-handed. Plain-laid ropes of corresponding sizes are called *tow-lines.*

HAWSER-LAID ROPE. Cable-laid, or 9-stranded left-handed rope. In England, hawser-laid rope is 3- or 4-stranded right-handed rope.

Haye. A peculiar ground shark on the coast of Guinea.

Hayler. An archaism for halliards.

Haze. A light mist.

Head. The upper part of anything; as, mast-head, timber-head, etc. An ornamental figure at the bow of a ship; as, figure-head, scroll-head, etc. Also, in a more extensive sense the whole fore part of a ship. The name is also applied to that portion of a ship, on each side the bowsprit, which is set apart for the convenience of the ship's company. The upper part of a gulf, bay, etc. The wind *heads* a ship when it causes her to break off from her course. A ship is trimmed *by the head* when she draws more water forward than aft. A ship *heads* in the direction marked out by her keel.

In mechanics, the height of the surface of a confined liquid of uniform density above any point at which its static or dynamic effect, such as pressure against the confining structure or the velocity of flow of an issuing stream, are observed or applied, as, for instance, the water-pressure at any part of a ship's side or bottom, or the flow of water from a flume to a water-wheel. The pressure upon any stated surface is due to the weight of a column of the liquid having an area of base equal to such surface, and a height equal to that of the head; and the velocity of flow may, by neglecting the resistance of friction, contracted vein, etc., be computed by the well-known formula $v = \sqrt{2gh}$, where $v =$ velocity, $g =$ gravity acceleration, and $h =$ the height.

Head of steam commonly refers to the pressure of steam above that of the atmosphere. It may, however, in computations relating to velocity of outflow, etc., be considered as the height of an imaginary column of steam of uniform density due to the pressure, and of corresponding weight.

HEAD AND GUN MONEY (*Eng.*). An encouragement in the prize acts by which £5 a head is given to the captors for every person on board a captured vessel of war or pirate.

HEAD-BOARDS. Boards placed at the forward and after ends of the hammock nettings. The close boarding between the head-rails.

HEAD-CRINGLES. Earing-cringles at the upper clews or corners of a sail.

HEAD-EARING. See EARING.

HEADER. The person in the Newfoundland fishing-vessels who is engaged to cut open the fish, tear out the entrails, break off the head, and pass it over to the *splitter*, who sits opposite to him. A dive head foremost into the water.

HEAD-FAST. A rope or chain employed to fasten the head of a ship or boat to a wharf or buoy, or to some other vessel alongside.

HEAD-HOLES. The eyelet-holes in the head of a sail; they are worked button-hole fashion, over grommets of twine of several thicknesses.

HEAD-KNEE. The knee of the head, or the cut-water, may be defined as a continuation of the stem. It is fayed and bolted to the stem, and secured to the bows of the ship by strong knees, called cheek-knees. The heel is scarfed to the fore-foot, and it is also secured to the upper part of the stem by a knee which is called the lacing.

HEADLAND. Wherever the coast presents a high cliffy salient angle to the sea, without projecting far into it, it is called a headland; but if the point be low, it is a spit, tongue, or point.

HEAD-LEDGES. The athwart-ship pieces which frame the hatchways.

HEADMOST. The situation of any ship or ships which are the most advanced in a fleet, or line of battle. The opposite of *sternmost.*

HEAD-NETTING. An ornamental netting used in merchant ships instead of the fayed planking to the *head-rails.*

HEAD-PUMP. A small pump fixed at the vessel's bow, its lower end communicating with the sea; it is mostly used for washing decks.

HEAD-RAILS. Those rails which extend from the back of the figure-head to the bows.

HEAD-ROPE. That part of a bolt-rope which terminates any sail on the upper edge, and to which it is sewed.

HEAD-SAILS. A general name for all those sails which may be set on the bowsprit, jib, and flying jib-boom, and employed to influence the fore part of a ship.

HEAD SEA. A name given to the waves when they oppose a ship's course. Their effect depends upon their height, form, and speed; sometimes they are steep, quick, and irregular, so that a ship is caught by a second before she has recovered from the first; these render her wet and uneasy.

HEAD-SHEETS. The sheets of the head-sails.

HEAD-STICK. A short round stick with a hole at each end, through which the head-rope of some triangular sails is thrust before it is sewed on. Its use is to prevent the head of the sail from twisting.

HEAD-TIMBERS. Small timbers used in building up the head, situated on each side to receive the planking.

HEADWAY. A term to express the progress of a vessel in a forward direction.

HEAD-WIND. A breeze blowing from the direction of the ship's intended course.

HEAD-YARDS. The yards on the foremast.

Heald. The *heel* over of a grounded ship.

Heart. A small strand around which the four strands of shroud-laid rope are laid. A peculiar sort of block, having one large hole in the centre and a groove around the circumference. *Collar-hearts* are open at the end opposite the laniard.

HEART-YARNS. The centre yarns of a strand.

Hearty. Open and free. *My hearties*, a cheerful salute to shipmates and seamen in general.

Heath. Various broom-stuffs used in breaming.

Heave. To throw; to cast; to push; to cause to move by the application of force; to force from or into any position. *To heave short*, to haul in cable till the ship is nearly over the anchor. *To heave down*, to cause a vessel to careen by applying tackles to her masts. (See HEAVING DOWN.) *To heave to*, to bring a vessel's head to the wind and adjust the sails so she will remain stationary, or nearly so; to put a vessel in the position of *lying to*. *To heave in sight*, to come in sight. *To heave up*, to throw up; to vomit; also, to raise; as, to *heave up* the anchor. *To heave ahead*, to cause a ship to move forward by manual force. *To heave in stays*, to put a vessel about by tacking. *To heave about*, to put about suddenly. *Heave and aweigh*, an encouraging call implying that the next heave will break the anchor out. *Heave and awash*, implies that the next heave will bring the anchor in sight. *Heave and pawl*, an order to heave at the capstan till the next pawl drops. *Heave and rally*, an injunction to the men at the capstan to exert themselves. *Heave out*, turn out; to get out of bed. *Heave the lead*, to take soundings with the hand-lead. *Heave the log*, to determine the ship's velocity by means of the log-line and time-glass. *To heave in*, to shorten in the cable. *Heaving and setting*, the up-and-down motion of the waves, or the similar motion of a ship, produced by the waves. *Heaving through all*, the surging and slipping of the cable when the nippers do not hold.

Heaver. A short wooden bar used as a lever.

Heaving Down. The process of placing a vessel upon her side for the purpose of calking or repairing. This only becomes necessary when access to docking facilities cannot be obtained, and it is seldom resorted to at the present day except with the smaller class of vessels. The process is practicable with sailing-vessels only.

A vessel may be hove down or careened to a wharf or a hulk fitted for the purpose. Preparations must be made to prevent injury to the masts and hull by straining by removing all weights except such as may be required to assist in careening the vessel. All masts and yards above the lower masts must be sent down, and those which are not required for shoring or strengthening the lower masts taken out of the vessel. The decks must be supported by shores wherever they are to be subjected to unusual strain.

The wedges are removed from the masts, and the latter are carried over against the partners on the offshore side. The lower masts are supported by spars, which rest upon the water-ways on the inshore side of the deck, and are lashed to the trestle-trees. The deck underneath these shores must be supported, and shores should also be firmly wedged between the heels of the lower masts and the offshore or upper side, to prevent any strain at the step. Additional shrouds should be placed over the mast-heads and set up to convenient places on the vessel's side, as the gun-deck ports or the air-ports, and an equal strain must be placed upon all the shrouds. Hawsers or chains may also be used as shrouds by setting them up to heavy bolts driven into the side abreast of each mast, the angle of support being increased by means of outriggers or spars projecting through the ports. Arrangements must be made for pumping the water from the vessel while she is careened, and the seams, on the side which is to be immersed, should be calked to prevent leakage.

The vessel should be moored by cables passed under the bottom and secured through the spar-deck ports on the inshore side, and by hawsers at the bow and stern.

The upper blocks of the purchases are lashed to the mast-heads, and the lower blocks secured to the wharf. The distance between the latter must be the same as the distances between the upper blocks. A vessel with three masts requires purchases only on the foremast and mainmast, but preventer purchases should be used as a precaution against accident.

The mast-heads are hove down to the required position by means of capstans or other mechanical powers.—*E. T. Strong*, *Lieutenant U.S.N.*

Heavy. *Heavy metal*, guns of great calibre. *Heavy sea*, high and strong waves. *Heavy gale*, a violent storm blowing from 35 to 60 miles an hour; indicated by 11 on the Beaufort scale.

Heck-boat. The old term for a pink. Latterly a clincher-built boat with covered foresheets, and one mast with a trysail.

Heckle. To dress flax for rope-making. Also, an artificial fly for fishing.

Heckle-back. A name of the fifteen-spined stickleback (*Gasterosteus spinachia*).

Heda. An early term for a small haven, wharf, or landing-place.

Hedgehog. A name formerly applied to a vessel which rowed with many oars.

Heel. The part of a thing corresponding in position to the human heel; as, the after end of the keel, the lower part of a mast, bowsprit, etc. *To heel*, to lie over; to be inclined out of the perpendicular; usually applied to a ship when she has a list, caused by the force of the wind. *To have the heels of*, to be able to sail faster than. *To show the heels* (or *a clean pair of heels*), to outsail; to sail away from; to outstrip in a race or in a chase.

HEEL-BRACE. A piece of iron-work applicable to the lower end of the rudder in case of damage to the lower supports.

HEEL-KNEE. The knee that is bolted to the stern-post and keel; the stern-post knee.

HEEL-LASHING. A lashing to secure the inner end of a boom when it is rigged out.

HEEL OF THE POST. The name usually given to the after end of the ship's keel, as well as the lower end of the stern-post.

HEEL-POST. The post supporting the outer end of a propeller.

HEEL-ROPE. A line to the heel of a topgallant mast to assist in sending it down. A line attached to the heel of a boom to rig it out.

HEEL-TACKLE. A purchase hooked to the heel of a heavy boom to rig it out. A tackle to secure the heel of a sheer-leg in masting.

Height. *Height of the tide*, the difference in the level of high and low water,—the *range* of the tide. *Height of a wave*, the distance from the crest to the hollow. *Height of the hold*, an expression sometimes used for *depth of the hold*.

Heliacal. A star rises heliacally when it first becomes visible in the morning, after having been hidden in the sun's rays; and it sets heliacally when it is first lost in the evening twilight, owing to the sun's proximity.

Helier. A cavern into which the tide flows.

Heliocentric. Concentric with the sun. See GEOCENTRIC.

Heliometer. An instrument designed for the accurate measurement of the diameters of the sun or planets.

Heliostat, or Heliotrope. This instrument reflects the sun's rays by a silvered disk, and is used in the great trigonometrical surveys. It has been visible at 100 miles distance.

Hell-afloat. A ship in which the lives of the officers and crew are rendered unhappy by the tyranny of the commanding officer.

Helm. The apparatus by which a vessel is steered. In small craft it consists of the rudder and tiller; in large vessels a wheel is added to give additional power. The helm is *amidships* when the rudder, tiller, and keel are in the same plane. It is *a-port* (or *a-starboard*) when the tiller is borne over to the port (or starboard) side. It is *a-lee* (or *a-weather*) when the tiller is borne over to the lee (or weather) side; it is also *down* (or *up*) when the tiller is borne over to the lee (or weather) side. It is *hard* a-port, a-lee, etc., when the tiller is borne over to the extreme limit. In case the tiller projects abaft, instead of forward of the rudder, the positions of the tiller will, of course, be the reverse of those given above. *To right* the helm, to put it amidships. *To shift* the helm, to bear the tiller over to the corresponding position on the opposite side of the ship. *To ease* the helm, to let the tiller come more amidships to lessen the strain on the rudder or tiller-ropes. *Steady!* the order to the helmsman to steer as the ship heads when the order is given. *Steady a-starboard* (or *a-port*)*!* the order to steer slightly to the left (or right). *Meet her*, turn the wheel in the opposite way to that in which the ship's head is moving, in order to check her at the proper point. *Nothing to starboard, windward, westward*, etc., a caution to the helmsman that the ship must not be allowed to go the slightest to starboard, windward, westward, etc., of her course. *No higher* (or *nothing off*), a caution to the helmsman, when sailing close-hauled, that the ship is too near (or not near enough) the wind; whereupon the wheel is put a little up (or down). When the ship is a good full and by, the fact is announced by saying *very well thus* or *very well dice*. *Luff*, to put the helm down and bring the ship's head up to the wind. *Mind your weather helm*, a caution to the helmsman to meet her if she begins to fly to,—generally given when about to relieve the ship of head-sail, or when some of the gear of the head-sails has been carried away. The terms *helm* and *wheel* are used indiscriminately. *To helm*, an old word for *to steer*. See RUDDER.

HELM-PORT. The hole in the counter through which the head of the rudder passes.

HELM-PORT TRANSOM. A timber across the counter at the height of the helm-port and bolted through every timber.

HELMSMAN. The person who has the management of the helm for the time being. When there are two or more men at the helm the man at the weather side of the wheel is the responsible helmsman, the others being placed at the wheel to assist in the manual labor or for instruction. The best seamen in the ship are sent to the weather-wheel, relieving each other every two hours; each period of two hours is called a *trick*. The lee wheel is taken by the ordinary seamen and landsmen.

Helsingfors, a seaport town on the Gulf of Finland, Russia, in lat. 60° 11′ N.; lon. 24° 75′ E. Pop. 33,700. Its harbor is defended by the strong citadel of Sveaborg. It has an active trade in exporting grain and importing manufactured goods.

Hemp (*Cannabis sativa*). A manufactural plant of equal antiquity with flax. The produce of hemp in fibre varies from 3 to 6 hundredweight per acre, and forms the best of all cordage and ropes. It is mixed with opium in the preparation of those rich drugs called hasheesh.

Hen-frigate. A ship wherein the captain's wife interferes in the duty or regulations.

Henry, The Navigator. A famous prince, fourth son of John I., King of Portugal, born at Oporto in 1394. He first won distinction at the conquest of Ceuta, in 1415. His grand ambition was to discover unknown regions. Having, after the death of his father, taken up his residence at Sagres, in Algarve, he erected there an observatory and established a school for the instruction of the sons of the nobility in navigation and its kindred sciences. He dispatched his pupils on voyages of discovery, one of which resulted in the discovery of the Madeira Islands, in 1418. In 1433 one of his mariners rounded Cape Nun, up to that time regarded as the end of the earth, and took possession of the coasts as far south as Cape Bojador. The following year one of his ships reached a point 120 miles beyond Cape Bojador, and in 1440 Cape Blanco was attained. Henry had alone borne all the expenses of these voyages, but from this time forth societies formed under his patronage and guidance assumed the cost of prosecuting the work of discovery, which had become a passion with the whole nation. His own interest and energy, however, continued unabated. In 1446 his captain, Nuno Tristan, doubled Cape Verd, in Senegambia, and in 1448, Gonzalez Vallo discovered three of the Azores. Henry died in 1463, having had the satisfaction of learning that his mariners had reached as far south as Sierra Leone.

Hen's-ware. A name of the edible sea-weed *Fucus esculentus.*

Hercules. A constellation to the south of Lyra and Draco. *α Herculis* (called also *Ras Algethi*) and *α Ophinci* form a pair, which may be known by their being the first bright stars in a line drawn southward from the pair in Draco, *α Herculis* being nearest to the Great Bear. According to the calculations of Sir W. Herschel, the solar system is traveling towards the star λ *Herculis*, R. A. 17^h 25.9^m, Dec. 26° 12′ N.

Hercules, Pillars of. The name given by the ancients to the two rocks at each side of the entrance to the Mediterranean. The first author to mention them was Pindar, who places one of them at Gades (Cadiz); the most general opinion, however, identified them with Calpe (now Gibraltar) and Abyla (now Ceuta).

Herling. A congener of the salmon species found in Scotland; it is small and shaped like a sea-trout.

Hermit-crab. A name applied to a group of crabs (family *Paguridæ*) of which the hinder part of the body is soft, and which habitually lodge themselves in the empty shell of some mollusk. Also called *soldier-crab.*

Hermo. A Mediterranean term for the meteor called *carpo-santo.*

Herndon, William Lewis. Born in Fredericksburg, Va., October 25, 1813; drowned by the sinking of steamer "Central America," September 12, 1857. He entered the navy at the age of 15; served in the Mexican war; and was 3 years engaged with his brother-in-law, Lieut. Maury, in the Observatory at Washington. In 1851–52 he explored the Amazon River, under the direction of the U. S. government. A narrative of the expedition is contained in Herndon's "Exploration of the Valley of the River Amazon" (1853), and in Part II. of the same work, by Lieut. Gibbon, who accompanied him during a part of the journey, 1854. In 1857 he was commander of the steamer "Central America," which left Havana for New York, September 8. September 11, during a violent gale, she sprang a leak, and sank on the evening of September 12, near the outer edge of the Gulf Stream, in lat. 31° 44′ N.

Herne. A bight or corner, as Herne Bay, so called from lying in an angle.

Hernshaw, Herne. Old words for the heron.

Heron. A large bird of the genus *Ardea*, which feeds on fish.

Herring. A fish of the genus *Clupea* (*C. harengus*). Herrings move in vast shoals, coming from high northern latitudes in the spring to the shores of Europe and America, where they are taken and salted in great quantities. *King of the herrings*, a cartilaginous fish (*Chimacar monstrosa*), allied to the sturgeon, which follows the shoals of herring. The males of the species have a spinous disk in front of the eyes; whence the name.

HERRING-BONING. A method of sewing up rents in a sail by small cross stitches, by which the seam is kept flat.

HERRING-BUSS. A peculiar boat of 10 or 15 tons, for the herring-fishery.

HERRING-COB. A young herring.

HERRING-GUTTED. See SHOTTEN-HERRING.

HERRING-HOG. A name for the porpoise.

HERRING-POND. The Atlantic Ocean.

Heterodromous Levers. The windlass, capstan, crank, crane, etc.

Heteroplon. A kind of naval insurance, where the insurer only runs the risk of the outward voyage; when both the going out and return of a vessel is insured, it is called *amphoteroplon.*

Hettle. A rocky fishing-ground in the Firth of Forth, which gives name to the fish called Hettle-codling.

Hidden Harbor. That of which the outer points so overlap as to cause the coast to appear to be continuous.

Hide. To beat; to rope's-end or drub.

High-and-dry. The situation of a ship or other vessel which is aground, so as to be seen dry upon the strand when the tide ebbs from her.

High Latitudes. Those regions far removed from the equator towards the poles of the earth.

High-pressure Engine. A non-condensing steam-engine, or one in which the steam, after having performed its work, is expelled into the atmosphere instead of into the vacuum of a condenser.

High-water. The greatest height of the flood-tide. See TIDE.

HIGH-WATER MARK. The line made by the water upon the shore when at its greatest height; it is also designated the *flood-mark* and *spring-tide mark.* This constitutes the boundary-line of admiralty jurisdiction as to the soil.

Higre. See BORE.

Hike. A brief equivalent to "*be off*," "*go away.*" It is generally used in a contemptuous sense; as, he was *hiked off*,—that is, dismissed at once, or in a hurry. *To hike up*, to kidnap, to carry off by force.

Hilt. The handle and guard of a sword.

Hind-castle. A word formerly used for the poop, as being opposed to *fore-castle.*

Hippagines, or Hippagogæ. Ancient transports for carrying cavalry.

Hipper, or Hipping-stones. Large stones placed for crossing a brook.

Hippo-camp. The sea-horse.

Hippocampus. A small fish, so termed from the head resembling that of a horse. They live among reeds and long fuci, to which they cling with prehensile tails.

Hippodame. An old word for a sea-horse.

Hipsy. A drink compounded of wine, water, and brandy.

Hirecano. An old word for hurricane.

Hirst. The roughest part of a river-ford. A bank.

Hitch. A species of knot by which a rope is made fast to a spar or other object. Figuratively, an impediment. *To hitch*, to make a rope fast by means of a hitch. To pull up with a jerking motion; as, to *hitch up* the trousers. For the various hitches, see under proper heads.

Hitchcock, Robert B., Commodore U.S.N. Born in Connecticut. Appointed from Connecticut, January 1, 1825; schooner "Shark," West India Squadron, 1827; frigate "Delaware," Mediterranean Squadron, 1829–31; special duty, 1833–34.

Commissioned as lieutenant, March 3, 1835; special duty, 1837; frigate "Ohio," Mediterranean Squadron, 1840; rendezvous, Boston, 1843; frigate "Savannah," Pacific Squadron, 1845–46;

ordnance duty, 1850–52; commanding store-ship "Relief," 1853; inspector, etc., Boston, 1854–55.

Commissioned as commander, September 14, 1855; ordnance duty, 1856–57; commanding steam-frigate "Merrimac," Pacific Squadron, 1858–60; inspector of ordnance, 1861.

Commissioned as captain, 1861.

Commissioned as commodore, July 16, 1862; commanding steam-sloop "Susquehanna," Western Gulf Squadron, 1862–63. During the greater portion of the time Commodore Hitchcock was attached to the Western Gulf Squadron, and for some months he was the senior officer of the blockading fleet off Mobile. Ordnance duty, 1864–65; commandant navy-yard, Norfolk, 1866; special duty, 1870–72. Retired, September 25, 1866.

Hitcher. An old term for a boat-hook.

Hoam. The dried fat of the cod-fish.

Hobble. A perplexity or difficulty. *Hobbles*, irons or fetters.

Hobbler (*Eng.*). A coast-man of Kent, a bit of a smuggler, and an unlicensed pilot, ever ready for a job in either of these occupations. Also, a man on land employed in towing a vessel by a rope. Also, a sentinel who kept watch at a beacon.

Hobit. A small mortar of 6 or 8 inches bore, mounted on a gun-carriage, in use before the howitzer.

Hoboken, Hudson Co., N. J., is a port of entry opposite New York City, and immediately above Jersey City. The Stevens Institute of Technology is located here, and the city has extensive manufactories and foundries. It is one of the largest coal-shipping ports in the world, being the principal depot from which New York and its shipping are supplied. Three lines of steamers start from this port. Intercourse with New York is maintained by three lines of ferry-boats. Pop. 25,000.

Hobrin. A designation of the blue shark, *Squalus glaucus.*

Hoc. The picked dog-fish, *Squalus acanthias.*

Hock-saw. A fermented drink along the coasts of China, partaking more of the nature of beer than of spirit.

Hod. A hole under a bank or rock forming a retreat for fish.

Hoddy-doddy. A sea-term for a revolving light.

Hodmadods. The name among early navigators for Hottentots. See Dodman.

Hoe-mother, or Homer. The basking shark, *Squalus maximus.*

Hoe-tusk. The smooth hound-fish of the Shetlanders, *Squalus mustela.*

Hog. A kind of rough, flat scrubbing broom, serving to scrape a ship's bottom under water, formed by inclosing a number of short twigs of birch, or the like, between two pieces of plank, which are firmly attached to each other; the ends of the twigs were then cut off even, so as to form a brush of considerable extent. To this was fitted a long staff, together with two ropes, the former of which was used to thrust the hog under the ship's bottom, and the latter to guide and pull it up again close to the planks, so as to rub off all the dirt. This work was usually performed in the ship's boat.

Hogged. A significant word derived from the animal; it implies that the two ends of a ship droop lower than the midship part, consequently that her keel and bottom are so strained as to curve upwards. The term is therefore in opposition to that of *sagging.* Many ships hog in launching, caused by the after part of the vessel not being properly water-borne till she is clear of the ways.

Hog-chains. Chains used for keeping a ship of light structure in shape, being attached to a frame called a hog-frame at one end, and secured at the other end to some part of the vessel which needs sustaining.

Hog-frame. A truss-frame which is used in light-draft steamers, especially to compensate for the want of strength in the sides of such steamers.

Hog-in-armor. A sobriquet for an ironclad ship.

Hogo. From the French *haut goût*, a disagreeable smell, but rather applied to ill-ventilated berths than to bilge-water.

Hoise. The old word for hoist.

Hoist. To raise by means of a rope or tackle. The perpendicular height of a flag or sail,—applied to sails, the yards of which travel up and down masts. The corresponding term for courses is *drop.* The hoist of a stay-sail is the length of the luff.

Hold. The interior portion of a ship below the lower deck. The *after-hold* is abaft the main-mast, the main-hold just forward of the main-mast, and the fore-hold is in the vicinity of the fore-hatchway. *To stow* the hold, to arrange the contents of the hold in a proper manner. *To break out* the hold, to remove all articles therefrom. *To hold* the land, to keep a ship near the land in cruising. A ship *holds* her own when she is not losing ground in a race or chase. *To hold a good wind*, to have weatherly qualities. *To hold water*, to check the progress of a boat by immersing the oars and keeping them stationary in the water.

Hold-beam. One of the lowest range of beams in a merchantman. In a man-of-war, they support the orlop-deck.

Hold-stanchions. The stanchions which support the hold-beams amidships.

Holding-down Bolts. The large bolts used for securing the machinery of a vessel to the hull. In wooden ships a number of these bolts pass entirely through the floor-timbers, and are provided with large square washers embedded in the outside of the frame. Such bolts, if of iron, are covered on parts passing through wood by a casing of bronze composition cast upon them to protect them from corrosion.

Holiday. Any part left neglected or uncovered in paying, painting, blacking, tarring, etc.

Holland, Navy of. The growth of European navies has been necessarily contemporaneous. The rivalries born of foreign possessions and commerce put England, Holland, and Portugal on the alert in the 16th century, and the acquisitions of each nation on the shores of India and the islands of the Eastern Archipelago brought them at an early period into hostile contact. France and Spain followed in their wake, and in less than a century all of these nations were alternately in arms against each other, or allied for offensive and defensive purposes. From her

maritime position Holland has been a nursery of seamen for centuries, and at one time she was omnipotent on the ocean. The history of her successes is told in the brief biographies of De Ruyter and Van Tromp (which see), and the record of the Dutch explorers of northern regions and the Pacific Ocean. It is unnecessary, therefore, to detail them minutely here. Let it suffice that, owning valuable lands in the Eastern Archipelago, and keeping a watchful eye upon the cupidity of her German neighbor, she now maintains a fleet of 25 armored and 90 unarmored steam-vessels, varying in indicated horse-power from 340 to 4630. The navy is officered by 2 vice- and 4 rear-admirals, 19 captains, 43 lieutenant-captains, 308 lieutenants (first and second), 52 midshipmen, and 65 medical officers. The marine infantry consists of 45 officers and 2120 non-commissioned officers and privates. The navy is recruited by enlistment, but conscription is resorted to in an emergency. The colonial possessions of Denmark in India comprise 16 islands and parts of the coasts of Borneo and Sumatra, and 6 West India Islands, besides Surinam.

Hollards. The dead branches and loppings of trees.

Hollebut. A spelling of *halibut.*

Hollow Sea. The undulation of the waves after a gale; long hollow-jawed sea; ground-swell.

Hollow Shot. Introduced principally for naval use before the horizontal firing of shells from guns became general. Their weight was about two-thirds that of the solid shot; thus they required less charge of powder and weight of gun than the latter, whilst their smashing effect and first ranges were supposed to be greater. It is clear, however, that if filled with powder, their destructive effect must be immensely increased.

Holometrum Geometricum. A nautical instrument of brass, one of which was supplied to Martin Frobisher in 1576.

Holus-bolus. Altogether; all at once.

Holy-stone. A sandstone used in scrubbing decks. The name probably arose from their being most frequently used on Sunday, though by some it is attributed to the kneeling of the men while using it. *To holy-stone*, to clean a deck with holy-stones. *To dry holy-stone*, to holy-stone without using water,—done on lower decks in damp weather.

Home. Domicile; residence. The place where a person or thing abides. *To haul home a sheet*, to haul it to its proper position when the sail is set. The anchor comes *home* when, in heaving up, the anchor is dragged toward the ship instead of the ship's being hauled up to the anchor.

Home-station. The station which includes our Atlantic coast within its limits; the North Atlantic Station.

Homeward-bound. Returning homeward.

Homeward-bounder. A very long pennant hoisted by a homeward-bound ship.

Homocercal. Having the tail symmetrical, the vertebral column terminating at its commencement; opposed to *heterocercal.*

Honolulu. Capital of Hawaii, on the southwest side of Oahu, one of the Sandwich Islands. Lat. 21° 18′ 12″ N.; lon. 157° 50′ 36″ W. It has a good harbor, and is the principal station for vessels cruising in the Pacific Ocean. Pop. 15,000.

Hood. The foremost and aftermost plank in each strake. A covering for a hatch or skylight. The cowl of a funnel. *Naval hoods*, thick pieces of timber encircling the hawse-holes.

Hooding Ends. The ends of the hoods where they set in the rabbet of the stem and the stern-post.

Hook. A name given to anything having the end bent or curved; as, boat-hooks, can-hooks, foot-hooks, etc.

Hook and Butt. The scarfing of two ends of plank over each other, in such a manner that they cannot be drawn apart endways.

Hook-motion. In the steam-engine, an arrangement of valve-gear in which the motion for going ahead or backing is transmitted from the respective eccentrics to a rock-shaft or valve-stem cross-head by *eccentric hooks* or *gabs.* This enables the valves, when the hooks are detached, to be worked with a starting-bar by hand, which is convenient in certain classes of single engines.

Hook-scarf. Differs from the plain scarf, in that the upper end is formed into a hook and projects from one to two or more inches into the timber, thus giving greater security.

Hooker, or Howker. A coast- or fishing-vessel,—a small hoy-built craft with one mast, intended for fishing. They are much used by pilots, especially off the Irish ports. Also, Jack's name for his vessel, the favorite "old hooker." Also, a term for a short pipe, probably derived from *hookah.*

Hoop. The principal hoops of different kinds used for nautical purposes are noticed under their several names. In wind-bound ships in former times the left hands of several boys were tied to a hoop, and their right armed with a nettle, they being naked down to the waist. On the boatswain giving one a cut with his cat, the boy struck the one before him, and each one did the same, beginning gently, but becoming irritated, they at last laid on in earnest. Also, an old nautical punishment for quarrelsome fighters was, that two offenders, similarly fastened, thrashed each other until one gave in. The craven was usually additionally punished by the commander.

Hopkins, Esek, Commodore U.S.N., was born in Scituate, R. I., in 1718. Was appointed brigadier-general of Rhode Island forces by its governor, and on December 22, 1775, was appointed commander-in-chief of the American navy, being the first who held that title. Was called commodore and admiral in correspondence. He went to sea in the first squadron of 8 vessels, hoisting his flag in the "Alfred." Captured New Providence in an expedition on the 19th February, and also took a brig and two tenders. Encountering a frigate at sea, he did not succeed in capturing her, and, for an alleged want of skill in engaging her, he was censured by Congress, although a defense of his conduct by John Adams partially cleared him, and led the president of Congress to compliment him. Not getting his ships ready for sea, he was again cited to appear to answer for it, but neglected to obey the summons promptly, and was dismissed by Congress January 2, 1777, having

been at the head of the service 1 year and 10 days.

After the war he resided near Providence, R. I., and was several times a member of the General Assembly for that State, and died there February 26, 1802, aged 84. He was, when made commander-in-chief, 57 years old, and, Bancroft says, was old and incompetent. His portraits show him to be a man of vigor, and he was influential in the political affairs of his own State. His bravery was never called into question, but he was doubtless not a good seaman and incompetent to command the navy.—*F. S. Bassett, Lieutenant U.S.N.*

Hopkins, W. E., Commodore U.S.N. Born in Virginia. Appointed from Virginia, November 13, 1839; Home Squadron, 1841–43; Naval School, Philadelphia, 1845; frigate "Cumberland," 1847; schooner "Falcon," Home Squadron, 1848–49; coast survey, 1850–51; sloop "Marion," coast of Africa, 1851–55.

Commissioned as lieutenant, July 10, 1854; receiving-ship, Philadelphia, 1856–58; sloop "Macedonian," Mediterranean Squadron, 1859–60; sloop "Preble," 1861.

Commissioned as lieutenant-commander, July 16, 1862; rendezvous, Philadelphia, 1862; commanding steamer "Saginaw," Pacific Squadron, 1863–65.

Commissioned as commander, November 4, 1863; commanding steamer "Shamrock," European Squadron, 1866–67; League Island, Pennsylvania, 1868.

Commissioned as captain, June, 1870; navy-yard, Mare Island, California, 1870–72; commanding "Benicia," North Pacific Station, 1872–75; commanding receiving-ship "Independence," Mare Island, 1877–78.

Commissioned as commodore, December 1, 1877; leave of absence, 1879–80.

Hopper-punt. A flat-floored lighter for carrying soil or mud, with a *hopper* or receptacle in its centre to contain the lading.

Hoppo. The chief of the customs in China.

Hoppo-men. Chinese custom-house officers.

Horie-goose. A name for the *Anser bernicla*, or brent-goose.

Horiolæ. Small fishing-boats of the ancients.

Horizon (Gr. *horizon*, the boundary-line). The circle in which the heavens and the earth appear to meet. The horizon is the primitive circle in one of the systems of co-ordinates for defining points of the celestial concave relatively to the position of an observer on the earth's surface. See Co-ordinates for the Celestial Sphere.

Horizon, Artificial. A reflector whose surface is perfectly horizontal, used to observe altitudes on shore. See Artificial Horizon.

Horizon, Celestial. The great circle in which the planes of the sensible and rational horizon (becoming coincident when produced indefinitely) cut the celestial sphere.

Horizon-glass. In reflecting astronomical instruments, such as the sextant, the horizon-glass is that which is fixed in front of the telescope, the lower portion of it being a mirror, the upper transparent. It derives its name from the fact that in taking an altitude the horizon is seen by direct vision through its upper portion.

Horizon, Rational. The plane through the centre of the earth drawn parallel to the tangent-plane at the observer's station.

Horizon, Sea. The small circle which bounds the view of a spectator in the open sea.

Horizon, Sensible. The plane touching the earth at the station of the observer, and extended to the celestial sphere.

Horizon, Shore. When the sea-horizon is hidden from view by intervening land, the water-line on the beach often serves the purpose of a horizon in observing altitudes. See Dip.

Horizontal Parallax. The parallax of a celestial body when in the horizon of the observer; distinguished from *parallax in altitude*. See Parallax.

Horizontal Plan. Any level plane or plan to show the length and breadth of the object to be delineated without showing the height.

Horizontal Projection of the Sphere. A projection of the sphere—whether orthographic, stereographic, or central—in which the primitive plane or plane of projection coincides with, or is parallel to, the horizon.

Horizontal Ribband-lines. Those ribband-lines used in laying off the ship upon the mold-loft floor, which are taken off level with the ship's body, or square from the centre line at the intersection of the frame-lines, instead of in the diagonal direction, before being applied to the half-breadth plan, where they are used for fairing the ship's body.

Horizon, Visible. The boundary of our view, whether of the heavens or of the earth.

Horn. One of the arms of the cross-trees, or of a cleat. To place anything to stand square from the middle line of the ship, by setting off an equal distance from each side of the middle line, as in a frame.

Horn-beak. A fish. See Horn-fish.

Horned Pout. A fish of the genus *Pimebodus;* cat-fish. See Cat-fish.

Horn-fisc. Anglo-Saxon for the sword-fish.

Horn-fish. The gar-fish, or sea-needle, also called *horn-beak.*

Horn-fisted. Having hands inured to hauling ropes.

Horn-keck. An old term for the *green-back* fish.

Hornotinæ. Ancient vessels which were built in a year.

Horologium. See Constellation.

Horologium Universale. An old brass nautical instrument, one of which was supplied to Martin Frobisher when fitting out on his first voyage, in 1576, for the discovery of a northwest passage.

Horse. The iron rod placed between the fife-rail stanchions on which the leading-blocks are rove or secured. Also in fore-and-aft rigged vessels it is a stout bar of iron with a large ring or thimble on it, which spans the vessel from side to side just before the foremast, for the fore-stay-sail sheet, and when required one is also used for the fore and main boom sheets to haul down to and traverse on. A block in a whaler for cutting blubber on. An old name for a foot-rope, and it was also formerly applied to what is now known as a *lizard.* The name is also sometimes given to a jack-stay forward or abaft the mast, on which a yard or sail is hoisted. *Salt-horse*, Jack's name for salt-beef.

Horse-block. A grating-platform for the convenience of the officer in charge of the deck.

Horse-buckets. Covered buckets for carrying spirits or water in.

Horse-buckie. The great whelk.

Horse-cockle. See GAWKY.

Horse-foot. A name of the *Limulus polyphemus;* called also the horse-shoe or lantern-crab.

Horse-latitudes. A space between the westerly winds of higher latitudes and the trade-winds, notorious for tedious calms. The name arose from old navigators often throwing the horses overboard which they were transporting to America and the West Indies.

Horse-mackerel. A large and coarse member of the Scomber family, remarkably greedy, and therefore easily taken, but unwholesome.

Horse-marine. An awkward lubberly person. One out of place.

Horse-potatoes. The old word for yams.

Horse-power. The unit of measure of the power of prime movers, represented by 33,000 *foot-pounds per minute.* See POWER.

In the steam-engine, indicated horse-power, the symbol for which is IHP, is computed by multiplying the mean unbalanced pressure on the piston in pounds, as obtained by an indicator, by the velocity of the piston in feet per minute, and dividing the product by 33,000. This includes the energy absorbed by friction of the loaded machinery, power required for working pumps, etc.; but these resistances to useful work bear nearly a constant ratio to the power employed in well-constructed machinery of similar type. *Gross horse-power* includes all prejudicial resistances, such as friction, back-pressure, etc.; and *net horse-power* is the actually applied energy to the work performed; and *nominal horse-power* is a British conventional term expressive of the capacity of the cylinder and size of the engine, in which it is assumed that a constant effective steam-pressure of 7 pounds per square inch and a piston velocity of about 200 feet per minute corresponds to an indicated horse-power.

Horse-shoe Clamp. The iron or copper straps so shaped, used as the fastenings which connect the gripe with the fore-foot at the scarf of the keel and stem.

Horse-shoes. Straps of composition in the form of a horse-shoe, used for securing the stem to the keel, placed on opposite sides, let in flush and bolted through; rings are now generally used instead.

Horse-tongue. A name applied to a kind of sole.

Horsing-iron. An iron fixed in a withy handle, sometimes only lashed to a stick or tree-nail, and used with a beetle by calkers. *To horse-up,* to harden in the oakum of a vessel's seams with a horsing-iron.

Hose. A long flexible pipe, made of leather, canvas, or gum and canvas, used for conveying water for extinguishing fires or for other purposes.

HOSE-COUPLING. An arrangement for connecting sections of hose together. It consists of a pair of cylindrical pieces of metal, usually brass, provided with a male and female screw so that they can be firmly connected together and made water-tight by means of a gum or leather washer. The parts are secured to the ends of the sections of hose by clamps or by being bound with wire.

Hose-fish. A name for a kind of cuttle-fish.

Hospital. A place appointed for the reception of sick and wounded men, with a regular medical establishment. An attacking force should avoid firing on hospitals whenever they are designated by flags or other symbols understood. It is an act of bad faith, amounting to infamy, to hoist the hospital protective flag over any other building, unless the attacking force should request or consent that it might be used in order to spare edifices dedicated to science, or literature, or containing works of art. See NAVAL HOSPITALS.

Hospital Gangrene. *Synonyms.*—Known under the various titles of putrid ulcer, pulpy gangrene, pourriture d'hôpital, gangræna contagiosa, phagedæna gangrænosa, gangræna nosocomialis, hospital mortification, diphtheria of wounds, etc.

History.—The history of this disease may be traced backwards, for a period of more than 150 years, in the records of great wars and of large hospitals.

La Motte, in 1722, mentioned, and Pouteau, in 1783, described, hospital gangrene. Hennen, Blackadder, and Guthrie wrote excellent accounts of its appearance during the Peninsular war of 1813. The Crimean war, the war of the Rebellion in 1861, and the Franco-Prussian war, all added largely to the records of this now well-recognized disease.

Nature and Cause.—Its essential nature has, however, not been understood. Unsuccessful attempts to explain its appearance and spread by reference to bad sanitary surroundings have been made. But it has been found to occur under the best hospital conditions, and has failed to appear where filth, overcrowding, and neglect would seem to have specially invited it.

Without stating various conflicting views, it is sufficient to give what is to the writer a simple and complete solution of the question of the origin and epidemic spread of hospital gangrene, viz., that it is identical with diphtheria.

The facts going to show this are as follows:

1st. *Historical proofs,* as of the co-existence of both these diseases in epidemic form at the same time and place.

This occurred under the writer's observation in Cincinnati, O., during the civil war. Hospital gangrene attacked the U. S. army hospitals, while diphtheria was rife in civil practice throughout the city.

Similar observations were made in Philadelphia, Pa., and Nashville, Tenn., and other cities during the war.

2d. *Similar causation.* An atmospheric miasm or germ, epidemic under favorable circumstances, necessarily exists to account for the origin and spread of diphtheria.

Von Pitha and Fock declare the same conclusion as the result of their studies into the cause of hospital gangrene.

3d. *Interchangeable results* from the same poison have been observed by the writer. Several cases of hospital gangrene have occurred in his practice, caused by direct infection of wounds by diphtheria; and one case of hospital gangrene communicated diphtheria to two other members of a family.

4th. *Contagion* by contact and *infection* through the atmosphere are known to be modes of spreading both these diseases.

5th. *Pathological proofs.* The microscopic appearances in hospital gangrene are bacteriæ, micrococci, and streptococci, exactly as in diptheria. Both diseases, also, may be separated into two forms, one being catarrhal, exudative, or pulpy, the other ulcerative, phagedenic, malignant, and rapidly fatal.

6th. *Both diseases are local* at first, general infection of the constitution only occurring secondarily in either disease.

7th. *Methods of cure* are similar, and identical remedies are employed in both diseases.

8th. *Similar modes of death* are noticed, and especially is "heart-clot" frequent in both diseases.

Hospital gangrene, therefore, is diphtheria attacking wounded surfaces.

Symptoms.—Such attack is ushered in by stinging pain in the part. The process of healing in the wound is arrested.

Ash-colored and yellowish exudations are seen to spread over its surface. Loss of vitality, sloughing, and destructive changes follow. Erysipelas may complicate. Hemorrhages are apt to set in, often fatally. Vast destruction of the soft tissues occurs in phagedenic cases. In 24 hours a wound may become enlarged from the size of a silver dollar to an extent sufficient to embrace the entire limb. In many there is very little or no fever or constitutional disorder. In others, irritative or adynamic forms of fever may be caused by absorption of putrescent material from the wound. But no constitutional disorder inaugurates the attack, and no increased liability is incurred by the scrofulous, syphilitic, or scorbutic men in hospitals.

Treatment.—Isolation in tents, in the open air, is of the first importance, both as a curative and as a preventive means.

Next, the local disease must be destroyed in its nest. Entire removal by knife, scissors, and cauterization of all diseased tissue must be effected.

Disinfection of the wound by the most efficient germicide agents must be thoroughly accomplished.

Finally, suitable protective and antiseptic dressings must be applied to guard the purified surfaces from re-inoculation by the atmospheric germs of the disease.

These principles embrace all that is needed for the local cure.

Either separately or variously combined, they have entered into all the successful plans of treatment on record.

Nitric acid, bromine, and the actual cautery have been found the most efficient agents to destroy the local disease, both from their caustic and their chemical action.

Chlorine was used with complete success by the writer in the Cincinnati U. S. army general hospitals.

These agents also accomplish the purpose of disinfection in great measure.

Dressings of creasote, carbolic acid, charcoal, buttermilk, turpentine, and the hydrocarbons, all have been successfully employed, and act by protecting the wound from renewed atmospheric infection, as well as by promoting the healing process.

In general, supporting treatment by food stimulants, iron, quinine, etc., is strongly indicated.

Results.—The fatality of hospital gangrene was enormous in the earlier wars, amounting in the hospitals of the Peninsular campaign to one-third of all those attacked. But during the late war the skill and originality of American surgeons very greatly lessened the mortality.

Goldsmith	records	152	cases and	4	deaths.
North	"	60	"	3	"
Brinton	"	88	"	2	"
Weeks	"	115	"	6	"
Herr	"	202	"	14	"

Over 100 cases were treated at Cincinnati, O., hospitals with but two deaths.

These results are unprecedented, and are due to early local treatment by strict disinfectant and antiseptic means.

The malignant form of the disease, however, is often beyond remedy, even under modern methods of care. Death follows close upon the attack, with symptoms of profound shock and blood-poisoning.—*John T. Carpenter, President of the Pennsylvania State Medical Society, and late Medical Director U. S. Vols.*

Hospital-ship. A vessel fitted to receive the sick, either remaining in port, or accompanying a fleet, as circumstances demand.

Hostage. A person given up to an enemy as a pledge or security for the performance of the articles of a treaty.

Hot-air Engine. An engine driven by the expansive force of heated air, a quantity of which, at normal temperature, is compressed by a suitable apparatus; heated to a high temperature; then allowed to expand and drive a piston until the energy due to its contained heat is nearly expended; and finally expelled from the cylinder.

Hot-coppers. See Coppers.

Hot-shot. Balls made red-hot in a furnace. Among the savages in Bergon, the women are in the rear of the combatants, and they heat the heads of the spears, exchanging them for such as are cooled in the fight.

Hot-water Pipe. A pipe for conveying water of condensation, etc., from a condenser to a feed-water reservoir or hot-well.

A pipe connected with a steam-boiler of a vessel of war, for the purpose of throwing hot water upon an enemy.

A pipe for warming an apartment by means of hot water.

Hot-water Pump. A pump attached to some types of steam-engine condenser for the purpose of withdrawing the water of condensation and discharging into a feed-water reservoir.

A pump specially adapted to the transmission of hot water by having its valves and packing made of material that can withstand the temperature. Leather, for instance, will not serve for valves and packing, even at a temperature far below that of boiling water. Such a pump cannot be depended upon to *draw* water, but must be supplied from a head; and ample *pet-cocks* must be provided to permit any accumulated vapor to escape from the barrel- and valve-chambers.

Hot-well. A reservoir into which is discharged the water of condensation drawn from the condenser of a steam-engine by an air-pump or hot-water pump.

Hound-fish. The old Anglo-Saxon term for dog-fish (*hund-fisc*).

Hounding. The length of the mast from the heel to the lower part of the head.

Hounds. Those projections at the mast-head serving as supports for the tressle-trees of large and rigging of smaller masts to rest upon.

Houndsid. A rope bound round with service.

Hour-angle. Generally, an angle at the poles of the heavens included between different hour-circles.

HOUR-ANGLE OF A HEAVENLY BODY. The angle at the elevated pole included between the celestial meridian of the observer and the hour-circle passing through the body. It is reckoned positively from the upper culmination of the body westward from 0 to 360°. The hour-angle is sometimes reckoned from the meridian in both directions,—positively to the westward, and negatively to the eastward; it would be well, however, if it were always reckoned in conformity with the apparent diurnal motion, just as right ascension is reckoned in conformity with the direct movements of the heavenly bodies.

Hour-circle. A great circle of the celestial sphere passing through the poles of the equinoctial; so called because it marks out all places having the same hour-angle.

House. To cover from the inclemencies of the weather; as, to house a ship over in harbor during cold weather. *To house a mast*, to lower it partly, to lessen the effect of a gale on the masts and rigging. *To house the bowsprit*, to ship it in its proper place. *To house a gun*, to run it in clear of its port and secure it. *To house an awning*, see AWNING.

HOUSE-BOAT. A boat with a cabin.

HOUSING. That part of a mast below the spar-deck. The inboard part of a bowsprit.

HOUSING-BOLT. A bolt above a port, over which the grommet is placed in housing a gun.

HOUSING-LINE. A line near the deck, to which the edge of an awning is secured when housed.

Houseline. Seizing-stuff made of three fine yarns laid up left-handed.

Houvari. A strong land-wind of the West Indies, accompanied by rain, thunder, and lightning.

Hovellers (*Eng.*). A Cinque-Port term for pilots and their boatmen; but colloquially, it is also applied to sturdy vagrants who infest the sea-coast in bad weather, in expectation of wreck and plunder.

Hover. To hang about; to move to and fro in the vicinity of; as, a vessel hovers about a coast.

Howard of Effingham, Lord. After many years of service in the reigns of Queen Mary and Elizabeth, this gallant seaman rose to the rank of lord high admiral, and in that capacity was mainly instrumental in preventing the dangers threatened by the Spanish Armada. At a later period (1596) he captured Cadiz in conjunction with the Earl of Essex.

Howe, Richard, Earl. The chronic state of war in which England found herself with France during the chief part of the 18th century afforded naval officers a large field of experience. Howe was constantly engaged in all parts of the world, and in each grade, from midshipman to admiral of the white, evinced great professional ability. Lord Hawke said of him that he never needed hints as to the *modus operandi* of enterprises. Hawke had only to direct that certain things were to be done, and Howe at once performed them. His chief service was in America when D'Estaing went to aid the revolted colonists, but he likewise did good work in the Mediterranean by supplying Gibraltar with provisions during the siege, and capped the climax of a brilliant career by a great victory over the French in the British Channel. The "glorious first of June" is a landmark in British history.

Howell, John C., Rear-Admiral U.S.N. Born in Pennsylvania, November 24, 1819. Appointed from Pennsylvania, June 9, 1836; sloop "Levant," West India Squadron, 1837–41.

Promoted to passed midshipman, July 1, 1842; frigate "Congress," Mediterranean Squadron, 1842–44; brig "Perry," East India Squadron, 1844–45; naval storekeeper, Macao, 1846–48.

Commissioned as lieutenant, August 2, 1849; frigate "Raritan," Home Squadron, 1849–50; sloop "Saratoga," East India Squadron, 1851–53; receiving-ship, Philadelphia, 1854–56; steam-frigate "Susquehanna," Mediterranean Squadron, 1856–58; receiving-ship, Philadelphia, 1859–60; steam-frigate "Minnesota," North Atlantic Blockading Squadron, 1861; battle of Hatteras Inlet.

Commissioned as commander, July 16, 1862; commanding steamer "Tahamo," Eastern Gulf Blockading Squadron, 1862–63; commanding steamer "Nereus," North Atlantic Blockading Squadron, 1864–65; two actions at Fort Fisher, December, 1864, and January, 1865.

Commissioned as captain, July 25, 1866; commanding rendezvous, Philadelphia, 1866–68; fleet-captain, European Squadron, 1869–70; chief of staff, European Fleet, 1871; commanding League Island Station, 1871–72.

Commissioned as commodore, January 29, 1872; commanding navy-yard, Portsmouth, N. H., 1872–75; chief of Bureau of Yards and Docks, 1875–78.

Commissioned as rear-admiral, 1877; special duty, 1878–79; commanding European Squadron, 1879–80.

Howitzer (derived by Grimm and Littré from the Bohemian *haufnice*, "catapult"). A short, light cannon, intended to throw large projectiles with comparatively small charges. A howitzer is of larger calibre than a gun of like weight; is mounted in a similar manner, and is used for shorter ranges. It was introduced by the Dutch in 1606, and soon became of general use, except by the French, who, considering it of small value because of the short range and inaccurate fire, did not introduce it until after Napoleon's wars had shown him its value. The howitzer was made with a chamber for the powder (of smaller diameter than the bore), and with a length of bore regulated to admit of the shell being reached by the hand, to adjust the fuze in the axis of the bore, after the gun was loaded. After the adoption of *sabots* this could be secured in long guns, and the howitzers were then made of greater length and came into universal use.

In the navy the howitzers are principally used in boats and in operations on shore; they would also be serviceable in repelling boarders. They

are of small calibre, the 24-pounder smooth-bore being the largest. The smooth-bores are being superseded by breech-loading rifled howitzers.

In the army howitzers of 8 inches bore are used for seige purposes, and for the defense of ditches in fortifications.

Hoy. A small vessel usually rigged as a sloop and employed in carrying freight and passengers along the sea-coast. It acquired its name from its stopping when called to from the shore, to take up goods or passengers. Hoys are now used for heavy work about a harbor; as transporting provisions, weighing anchors, etc.

Hoyman. One who navigates a hoy.

Hoyse. An old word for *hoist.*

Huddock. The cabin of a coal-barge.

Huddum. An old term for a kind of whale.

Hudson, Henry. A company of London merchants, desirous of shortening the route to China and Hindostan, fitted out an expedition, which they placed under the command of this English seaman in 1607. He sailed along the coast of Greenland beyond the 80th degree of latitude, when he was stopped by the ice. He had got within eight degrees of the pole,—a point never before attained by any navigator. He then returned home, but was soon employed by the Dutch East India Company to find a passage by the northeast. Failing in this, through the frozen condition of the seas, he sailed down the south coast of America, sighted Cape Cod, discovered Delaware Bay, and entered the great inland waters on which the city of New York stands. He went up one river as far as the site of Albany, and that river now bears his name. In 1610, Hudson was again engaged by an English company to attempt to find an entrance to the Pacific in a northwest direction. He passed through a strait and bay opening westward from the Greenland Sea, and these now bear his name. But his further explorations were stopped by the mutiny of his crew, who sent him adrift in a small shallop with scarcely any food. Neither Hudson, his son, nor the few men who adhered to him, were ever heard of again.

Huer. A man posted on an elevation near the sea, who by concerted signals directs the fishermen when a shoal of fish is in sight. Also the hot fountains in the sea near Iceland.

Hug. *To hug the land*, to sail as near it as possible. *To hug the wind*, to keep the ship as close to the wind as possible.

Hugger-mugger. Anything out of order or done in a slovenly way.

Hughes, Aaron K., Commodore U.S.N. Born in New York. Appointed from New York, 1838; made first cruise in the Pacific Ocean on board the frigate "Constitution," from January, 1839, until November, 1841; in February, 1842, was ordered to the brig "Boxer"; served in her in the Gulf of Mexico and in the West Indies until the autumn of the same year; served in the receiving-ship "Pennsylvania," Norfolk, Va., from January, 1843, until June of the same year; was then ordered to the frigate "Macedonian," African Squadron, and served in her until the winter of 1844.

Promoted to passed midshipman, May 28, 1844; served in the frigate "Columbia," coast of Brazil, from the fall of 1845 until the spring of 1846; served during the summer of 1846 in the office of the United States Coast Survey; in the fall of same year was ordered as passed midshipman to the steamer "Michigan," on the western lakes, and served in her until the summer of 1848; served in the receiving-ship "North Carolina" as passed midshipman from fall of 1849 until summer of 1850; was then ordered to the sloop "Albany," and served in her as acting master in the West Indies and Gulf of Mexico for two years and one month; in the winter of 1852 was ordered as acting master to the receiving-ship "Ontario," where he received a warrant as master in the line of promotion, and served in her until the summer of 1853.

Promoted to lieutenant, August, 1853, and in December of same year was ordered as lieutenant in sloop-of-war "Decatur," Pacific Squadron, until August of 1856; while attached to this vessel in Puget Sound, Washington Territory, in winter of 1855–56, had an engagement on shore, at the town of Seattle, with five hundred hostile Indians, who had attempted to murder the inhabitants, pillage and destroy the place; but through the unremitting watchfulness of the late Com. Guert Gansevoort their objects were frustrated by the landing of the officers and crew of the "Decatur"; engagement commenced at 8 A.M., and ended at 4 P.M., on the 26th day of January, 1856. It was estimated that the Indians lost 35 killed and 30 wounded. This ended hostilities in the territory. In the winter of 1856–57, ordered as lieutenant, and served on board the receiving-ship "Alleghany," Baltimore, as executive-officer until the fall of 1857, when he was ordered as lieutenant and executive-officer to the store-ship "Supply," of the African and Brazil Squadrons, serving until the fall of 1858; after a month's leave, was again ordered to the receiving-ship "Alleghany," where he served as a lieutenant until June, 1859; was then ordered as a lieutenant to the "San Jacinto," and served in her as second lieutenant, executive-officer, and about six weeks in command of that vessel, until January, 1860; was then ordered by the flag-officer commanding the African Squadron to the sloop "Portsmouth" as executive-officer, and served in her until June of same year; was then re-ordered to the "San Jacinto," at the Island of Madeira, and on her way to St. Paul de Loanda, west coast of Africa, was sent as prize-master of the captured slaver "Storm King," and after taking charge of that vessel 200 miles to the westward of the Congo River, and conveying 619 recaptured Africans to Monrovia, Liberia, a distance of 1500 miles, delivered them to the charge of the Rev. John Seys, government agent there; brought the prize to Norfolk, Va., in September, 1860; in December, 1860, ordered as lieutenant to receiving-ship "Princeton," at Philadelphia; served in her until April 23, 1861, on which day he was ordered to the Philadelphia City ice-boat, which had been improvised into a man-of-war in less than twenty-four hours, as executive; served in her in the Chesapeake, convoying transports with troops and munitions of war until the middle of May of same year; was then ordered to the frigate "Mississippi"; served in her as second lieutenant and executive in the Gulf Squadron until October 31, 1861, when he was ordered in command of the steamer "Water-Witch," serving in same squadron until April, 1862, when she was ordered North for repairs; while in com-

mand of the "Water-Witch," participated in several engagements with the enemy.

In June, 1863, was ordered to command the gunboat "Cimmaron"; served in her in South Atlantic Squadron, under Rear-Admiral Dahlgren, until May, 1864; while in her participated in the attack on the enemy's works before Charleston, August 17, 1863, and served in other engagements at the same place. In October, 1864, ordered to report to Acting Rear-Admiral Lee as ordnance-officer, Mississippi Squadron; in February, 1865, was transferred as executive-officer to the Mound City Naval Station, in which capacity he served until February, 1866; as light-house inspector of the sixth light-house district at Charleston, S. C., 1866–67.

Promoted to lieutenant-commander, July 16, 1862.

Promoted to commander, November 18, 1862.

Promoted to captain, February 10, 1869; commanding receiving-ship "Boston," 1870; commanding "Pensacola" (second-rate), Pacific Squadron, 1872–74.

Commissioned as commodore, February 4, 1875; commanding Naval Station, Port Royal, S. C., 1877–78; leave of absence, 1879; commandant navy-yard, Norfolk, Va., 1879–80.

Huissiers. The flat-bottomed transports in which horses were embarked in the Crusades.

Hulcock. A name for the *Squalus galeus*, or smooth hound-fish.

Hulk. A vessel condemned as unfit for the risks of the sea, dismantled, and used for harbor purposes; as, sheer-hulk, convict-hulk, etc.

Hull. The body of a ship independent of masts, sails, rigging, etc. *To hull*, to pierce the hull with shot. *A-hull*, the situation of a ship under bare poles with her helm lashed a-lee, and driving before wind and sea. *Hull-down*, a ship so far distant that her hull is below the horizon.

Hull, York County, England, is the third port in extent of business in the kingdom. Its docks and basins are very extensive and complete, surrounded by broad quays and large warehouses, and are crowded with shipping of all nations. The principal exports are cotton and woolen stuffs, yarn, etc. Its coasting-trade is highly important. Ship-building and its auxiliary manufactures, including boilers and steam-engines, are extensively carried on. Lat. 53° 44′ 36″ N.; lon. 0° 20′ W. Pop. 140,100.

Hull, Isaac, Commodore U.S.N., was born at Derby, Conn., on the 9th of March, 1775. He entered the merchant service at 12, and commanded a vessel at 19. Was appointed a lieutenant in the navy on the 9th of March, 1798.

He was first lieutenant of the "Constitution" on a cruise as flag-ship of Commodore Talbot in 1800, and was given command of an American sloop, the "Sally." In her he entered Port Platte, San Domingo, and cut out and carried to sea the "Sandwich," a privateer, rigging her in a short space of time. Returning home, he was commissioned a lieutenant at the reorganization of the service in 1801. He sailed from New York on the 10th June, 1803, in command of the "Enterprise"; in company with the "John Adams" captured a corsair, which blew up, June 22. On the arrival of the "Argus," November 11, he was transferred to her. He was promoted to master-commandant in April, 1804, assisted in the capture of a felucca, April, 1804, and participated in the actions of August 3 and September 28, off Tripoli, narrowly escaping capture on the 9th of August. Conveyed Gen. Eaton to Alexandria, and afterwards assisted that officer in the attacks on and capture of Derne, April 27, 1805. Returned home at the close of the war, and was made a captain, April 23, 1806.

On the breaking out of the war of 1812 he was in command of the "Constitution," in which ship in 1811 he carried specie to Ireland for payment of a debt in Holland, and was chased by a squadron, but escaped. Sailed again, July 12, 1812, and from the 17th to the 20th was chased by an English squadron of 7 vessels, escaping by the most consummate skill and seamanship. Sailing again on the 2d of August, he captured 5 merchantmen, and on the 19th, after a bloody fight, captured and destroyed the British frigate "Guerriere," 38. For this he was awarded a gold medal. He was a naval commissioner from 1815–17. Commanded the Pacific Fleet, in the frigate "United States," from 1824–27; leave of absence, 1828–29; navy-yard, Washington, 1830–35; leave of absence, 1836–37; waiting orders, 1838–39; commanded Mediterranean Squadron, 1840–41; on leave, 1842–43. Died at Philadelphia, February 13, 1843, aged 68.—*F. S. Bassett, Lieutenant U.S.N.*

Hull, Joseph B., Commodore U.S.N. Born in Westchester, N. Y. Appointed midshipman from Connecticut, November 9, 1813, joined the frigate "Congress" and went to Holland and the Mediterranean, 1815, returning in Commodore Bainbridge's Squadron; in the "Washington," 74, in the Mediterranean, 1816–17; transferred to the frigate "United States" in 1818, and returned in her to Norfolk in the summer of 1819; in 1820 attached to the Boston Navy-Yard; in the "Franklin," 74, Pacific Squadron, 1823, as passed midshipman; in 1824 ordered to schooner "Dolphin" as acting lieutenant; rejoined the "Franklin" and returned home in her in 1825.

Commissioned as lieutenant, January 13, 1825; in frigate "Constellation," West Indies, in 1827; ordered to sloop "John Adams," 1828, and returned home; in frigate "Guerriere," Pacific Squadron, 1829–31; attached to Washington Navy-Yard, 1831–33; in frigate "Potomac," Mediterranean Squadron, 1834–37; attached to receiving-ship at Boston from fall of 1839 to September 8, 1841.

Commissioned as commander September 8, 1841; in command of sloop "Warren," Pacific, 1843–46, to October, 1847, returning *via* Panama. While in command of the "Warren," off Mazatlan, sent in a boat expedition under Lieut. Radford (now rear-admiral), to cut out the Mexican gun-brig "Malekadhel," which was successfully done; was in command of the Northern District of California for a short period before the close of the Mexican war; commanding naval rendezvous, Philadelphia, from November, 1849, to December, 1851.

Commissioned as captain, September 14, 1855; in command of frigate "St. Lawrence," Brazil Squadron and Paraguay Expedition, 1856–59, returning in May; in command of the "Savannah," coast blockade, from June to September, 1861.

Commissioned as commodore, July 16, 1862;

superintending the building of gunboats at St. Louis, from June, 1862, until 1864, when he was transferred to Pittsburgh; in command of navy-yard, Philadelphia, from November 10, 1864, to January 1, 1866; president of Examining Board at Philadelphia from December 3, 1866, to July 8, 1867; light-house inspector for the first district, with headquarters at Portland, 1869–73. Total sea-service (1878), 22 years 3 months; shore and other duty, 17 years 6 months. Retired December 21, 1861.

Humber-keel. A peculiar clinchar-built craft used on the Humber.

Hummock. A hill with a rounded summit on the sea-coast. When in pairs they are termed *paps* by navigators. *Hummocks of ice*, protuberant lumps of ice thrown up by some pressure upon a field or floe, or any other frozen plane. The pieces which rise when large fragments come in contact, and bits of pack are frozen together and covered with snow.

Hump-backed Whale. A species of whalebone whale, the *Megaptera longimana*, which attains to 45 or 50 feet in length, and is distinguished by its low rounded dorsal fin.

Hunt, Timothy A., Commodore U.S.N. Born in Connecticut. Appointed from Connecticut, 1825; Pacific Squadron, 1827; Mediterranean Squadron, 1833–34.

Commissioned as lieutenant, December 17, 1836; receiving-ships, Boston and New York, 1840–43; frigate "Brandywine," East India Squadron, 1845; commanding ordnance-transport "Electra," 1847–48; navy-yard, Boston, 1850; frigate "Columbia," Home Squadron, 1853–55.

Commissioned as commander, September 14, 1855; ordnance duty, 1856–59; commanding steam-sloop "Narragansett," Pacific Squadron, 1860–61.

Commissioned as captain, July 16, 1862.

Commissioned as commodore, January 2, 1863; ordnance duty, Boston, 1862–67; special duty, New London, 1869–71; retired July 23, 1867.

Hurd. The strand of a rope.

Hurdigers. Particular artificers employed in constructing the castles in early ships.

Hurleblast. An archaic term for *hurricane*.

Hurricane. See STORMS, REVOLVING.

Hurricane-deck. A light deck over the saloon of a steamer. The upper deck of a river-steamer.

Hurter. A brass casting at either end of the slide of a gun-carriage for the trucks to take against.

Hurtle. To send bodily on by a swell or wind.

Husband, or Ships' Husband. An agent appointed by deed, executed by all the owners, with power to advance and lend, to make all payments, to receive the prices of freights, and to retain all claims. But this office gives him no authority to insure or to borrow money; and he is to render a full account to his employers. Also, a person who seldom leaves his ship.

Hush. A name of the lump-fish, denoting the female.

Hutch-hooks. Small pieces of oak used for temporary fastening of any work, generally placed over the heads of shores in building or in docking a vessel, secured to the vessel with riband-screws.

Hutt. The breech-pin of a gun.

Huz-zif. A general corruption of *housewife*, a very useful contrivance for holding needles and thread, and the like.

Hyades. The seven daughters of Atlas and Æthra; Ambrosia, Eudora, Coronis, Pasithoe, Plexaris, Pytho, and Tyche. They were changed by Jupiter into seven stars.

Hydra (Gr. *hudros*, the water-snake). A constellation to the south of Cancer, Leo, and Virgo. Its principal star, *α Hydræ*—called also *Cor Hydræ* and *Alphard*—may be found by continuing the line from δ and γ *Ursæ Majoris* through *α Leonis* to about half its length; the line through Castor and Pollux also points it out.

Hydraulic Block. A block placed under a ship in docking, and which is worked by a hydraulic pump, to be raised and lowered either at the bilge-blocks or at the keel-blocks.

Hydraulic Dock. An apparatus by which a vessel is raised clear of the water for examination and repairs by means of hydraulic presses. The vessel is brought over a platform suspended by chains passing over pulleys in the side-frame of the dock, and which are attached on each side to a strong beam connected with the cross-head of a hydraulic press.

Hydraulic Press. A machine in which the pressure of a piston or plunger of a pump acts upon a small area of a body of liquid, transmitting to a piston of larger area in a working cylinder a pressure or force proportional to the difference in area between the working piston and pump-plunger, and a speed inversely proportional to the difference. The pump draws liquid from a reservoir and forces it into the working cylinder; and when the return of the working piston is desired the liquid is released by a cock.

Hydrographer to the Bureau of Navigation. According to the organization of the U. S. Hydrographic Office, "the officer in charge will be the hydrographer to the Bureau of Navigation, and will be responsible for everything emanating from that office." The regulations of the bureau go on to say, "From intercourse with foreign hydrographic offices, from information received from our naval vessels and mercantile marine, together with the perusal of hydrographic publications, etc., he is expected to be acquainted with what has already been done and is doing in this branch, and to point out what may be desirable from time to time to accomplish." The hydrographer has the superintendence and general control of the various divisions of which the hydrographic office is composed; to him the head of each division refers any matter out of the ordinary routine of duty for decision. The position has always been held by an officer not below the rank of commander; he has not been appointed for any special period, but has been retained at the pleasure of the Navy Department.

There is an assistant hydrographer attached to the office, whose duty it is to act in the absence of the hydrographer, and also to assist him in any of the duties of the office.

The regulations of the bureau which established the position of hydrographer were not approved until January 21, 1871, although the act creating the hydrographic office was approved June 21, 1866. There was in the interval a chief of the office corresponding to the present hydrographer; but it does not appear that he had any title until

the approval of the regulations above referred to. Since the passage of the act creating the Hydrographic Office, the following-named officers have been at its head, viz.: Commander Fillebrown, Capt. N. B. Harrison, Commander Simpson, Commodore Emmons, Capt. Wyman,—who also continued in the position as commodore and rear-admiral,—Capt. Franklin, and Capt. De Krafft, the present incumbent. All maritime nations of any importance have a position corresponding to that of the hydrographer, which is filled, as with us, by naval officers of the different grades.—*S. R. Franklin, Captain U.S.N.*

Hydrographic Office. The act of Congress entitled An act to establish a Hydrographic Office in the Navy Department was approved June 21, 1866.

Before the passage of this act the charts for our naval vessels were issued from a number of different places which, from time to time, were used as depots of charts. About the year 1835 the Depot of Charts was a house on G Street between 21st and 22d Streets. From G Street, prior to the sailing of the U. S. Exploring Expedition, it was removed to a house on North Capitol Street, owned by Lieut. Wilkes. From Capitol Hill it was moved to a building on Pennsylvania Avenue, opposite to what is now the Columbia Hospital, and known as the Forsyth House. When the Observatory was completed the charts were issued from there, and in 1866, upon the establishment of a Hydrographic Office, which was located at the corner of 18th Street and New York Avenue, they were moved to that building, which building continued to be the Hydrographic Office until its removal to the Navy Department in 1879. The Hydrographic Office is now an annex of the Bureau of Navigation, but formerly everything connected with Hydrography was subject to the Bureau of Ordnance and Hydrography. When the Bureau of Navigation was created all matter relating to that subject was transferred to it.

This office is divided into the following departments, viz.: Division of Archives, etc., Chart Division, Meteorological Division, Division of Drafting and Engraving, and Division of Longitudes. There is also a library connected with the office, which contains technical and other works.

The Division of Archives is in charge of a naval officer, whose duty it is to collect and file all hydrographic information, and issue the same in the form of hydrographic notices and notices to mariners, which are disseminated for the benefit of navigation and are sent gratuitously to any masters of vessels or others interested in maritime affairs who may desire them. In the files of the archives are kept all the data of original surveys, and everything appertaining to that subject.

The Chart Division, which comprises the charts of this office and the British admiralty charts, is also in charge of a naval officer. From this division are issued all the charts to United States ships of war, and also to the agents at the important seaports of the United States, by whom they are sold to mariners at the cost of printing and paper. This division has charge also of the printing of the charts. The Meteorological Division is in charge of a naval officer, who, with his assistants, is employed in collecting and collating data for the construction of meteorological charts, intended finally to comprise the whole navigable ocean.

The Division of Drafting and Engraving is in charge of a hydrographic expert whose duty it is to superintend the drafting and engraving of all charts published by the office, and to see that the plates are corrected in accordance with the latest hydrographic information.

The Division of Longitudes is conducted by a naval officer, and when there is a doubtful question of the longitude of any point under consideration, this division investigates all the authorities upon the subject before the matter is finally decided. It is at present engaged in collecting the latitudes and longitudes of the important seaports of the world from the latest and most reliable authorities. The most important work, however, upon which it is engaged, and that upon which its other work chiefly depends, is the reduction of the observations for secondary positions of longitudes as determined by electric cable, by parties under the command of Lieut.-Coms. Green and Davis.

The librarian is a naval officer, whose duty it also is to see to the correction of nautical books and sailing directions, and to their issue to naval vessels and to the agents of the office.

In order that mariners may receive the publications of the office at the lowest possible rate, the law makes it obligatory that they be sold at the cost of printing and paper.—*S. R. Franklin, Captain U.S.N.*

Hydrography. The general term Hydrography is now used to include a description of the navigable waters of the earth, their contour and character, of the rocks and shoals likely to endanger navigation, the tides, currents, and depths of all navigable waters, of ocean meteorology, and of the best methods to adopt in making passages from one port to another. The same word is used to designate the art of making charts which shall show this varied information in a convenient form for the navigator.

As such work is, generally speaking, too extensive and costly to be carried on by private individuals, all maritime nations of importance have found it necessary to establish as a part of their administrative system a hydrographic office, the functions of which are substantially the same for all countries and comprise the conduct of hydrographic surveys, the preparation and publishing of charts and sailing directions, the issuing of charts and books to government vessels and supplying them through agents to the mercantile marine, and the constant international interchange of all information which may be of service to the navigator. If war were not to be apprehended, each government need only concern itself with the charts of its own shores, procuring necessary charts of other parts of the world from foreign officers; but as at any time such a supply would be subject to interruption, the hydrographic office of each prominent maritime nation seeks to supply its public and private ships with charts of all parts of the world, thus being independent in case of hostilities. The English government have published nearly or quite 3000 different charts, and the French about the same number. In the United States the hydrographic establishment is divided into two branches,—the U. S. Coast and Geodetic Sur-

vey, under the Treasury Department, dealing exclusively with the coasts of the United States, of which about 350 charts have been published, and the Hydrographic Office attached to the Navy Department, and engaged in the construction of charts of foreign coasts, of which about 700 have been published. This office also supplies all vessels of war with the necessary charts and books, and disposes of its publications through agents to the mercantile marine and others. An extensive and mutually valuable exchange of information is constantly going on between the hydrographic offices of the United States, England, France, Denmark, Norway, Sweden, Russia, Spain, Italy, Austria, Portugal, Holland, Belgium, Germany, India, Japan, Brazil, Buenos Ayres, and Chili, resulting, in 1879, in the publication by the U. S. Hydrographic Office of 87 *hydrographic notices* relative to discoveries and changes in the natural features of navigable regions, and 119 *notices to mariners* relating to additions to and changes in artificial aids to navigation. These form a yearly synopsis of the hydrographic work of the world.

The general object of the hydrographic survey of a coast-line is to produce such a chart that every part of the coast may be readily recognized and safely approached or passed by a stranger, and that its ports may be safely entered and left without the aid of a pilot. In addition to the charts of the coast-line, information as to the depth, current, and temperature of the sea is of great importance to the navigator, and is when known incorporated into the chart. See CHART, COAST SURVEY, DEEP-SEA SOUNDING.

It is only since the middle of the 18th century that accurate hydrographic surveys have been effected by the officers of various nations,—Capt. J. Cook, of the English navy; Des Barres, another Englishman, and Admiral Beautemps-Beaupré, of the French navy, being among the pioneers in this work.

As regards the extent of foreign coast-line surveyed, England is in advance of all other nations, and the work of her naval surveyors is of marked excellence. Although the surveys of foreign coasts by officers of the United States navy are by no means as extensive, their work is of a very high character, and the hydrographic survey of the coast of the United States compares favorably with any other work of the kind.

The surveys which have been made of coast-lines vary largely in quality, and may be divided into three classes, viz.: 1st. Complete triangulated surveys, where the adjacent waters have been thoroughly examined, leaving nothing to be desired in the way of information for the navigator; 2d. Running surveys made from ships, giving accurate plans of the harbors, but only approximately correct coast-lines; and 3d. Reconnoissances, where only the general direction and aspect of the coast is given, and where the navigator must be constantly on his guard against hidden dangers.

The surveys of the Atlantic coast of the United States, with those of England, France, Germany, and one or two other European nations, are the only ones to be placed without reserve in the first class, while those of by far the largest part of the earth's coast-line are embraced in the second class. The surveys of New Guinea, a majority of the Pacific and East India Islands, parts of the coasts of Africa and South America, and the Arctic and Antarctic regions are to be included in the third class.

No branch of hydrographic knowledge has received such great accessions during the last few years as that relating to the depths, temperature, and chemical constituents of the great oceans. In addition to the knowledge derived from the surveys of the United States ships "Tuscarora," "Essex," and "Blake," the English ships "Challenger" and "Alert," and the German ship "Gazelle," vessels engaged in laying submarine telegraph cables are constantly adding to our knowledge of the depths of the sea.

For an account of the various methods in use in marine-surveying the reader is referred to "General Instructions for Hydrographic Surveyors," published by the U. S. Navy Department; the annual "Report of the U. S. Coast and Geodetic Survey;" "Nautical Surveying," by Capt. W. N. Jeffers, U.S.N.; "Nautical Surveying," by Capt. E. Belcher, R.N.; "Practical and Theoretical Nautical Surveying," by Prof. J. K. Laughton; "Deep-Sea Sounding and Dredging," by Lieut.-Com. C. D. Sigsbee, U.S.N.; and "Cours de Navigatione et d'Hydrographie," by E. Dubois.—*F. M. Green, Lieutenant-Commander U.S.N.*

Hydrometer. An instrument for ascertaining the specific gravity or relative density of liquids. It is made of glass or metal, and consists of a hollow bulb or float provided with a slender stem which is graduated to any arbitrary scale suitable to the purpose for which it is used; projecting from the bottom of this bulb is a smaller one filled with shot or mercury for the purpose of keeping the instrument upright.

Hygiene, Naval. Though the principles of hygiene are pretty much the same everywhere, the practice on board ship presents some peculiarities, some difficulties: good or pure air; pure water, and enough of it; good food, enough and of such varieties as afford proper nourishment; proper employment for mind and body, without excessive labor; good discipline and other comfortable surroundings, are all necessary. Ever since Ulysses, on his raft, removed some of his clothes to enable him to swim ashore (Odyssey), human ingenuity has been contriving means to save life and to preserve health on the ocean.

Ventilation.—Pure air is sufficiently abundant on the wide ocean, so that proper ventilation is the main question with reference to this matter. Respired air has about the temperature of the human body, something near 37°.78 C. (= 100° F.); it is much warmer than the air of any habitable apartment, so that, in obedience to diminished specific gravity, it ascends, escapes by the hatches; thus any small vessel is sufficiently ventilated if only the hatches can be kept open But as the vessels increase in size the difficulties increase in such a way that the larger the vessel the more numerous the sick-list, the greater relative mortality, notwithstanding the great improvement in most other respects. The large ship is subdivided into many apartments, some of them not so well arranged as they might be, and they contain chests of dirty clothes, packages of spoiled cheese, and sometimes worse things; the air cannot remove everything bad about such things unless it has a fair chance. Devices for

mechanical ventilation have been very numerous, and though each one has been useful under the careful supervision of the inventor, all of them, ancient and modern, have failed in general utility: the foul-air pump, the bellows, and the fans are all effective in moving the air that comes within their influence, but the openings of the machines cannot reach every accumulation of foul air, or rather do not; and hence, with all their labor and expense, these machines merely circulate to the next aperture the air that comes within their power. In vessels of the monitor class it has been made possible, by the use of fans propelled by steam, to introduce air at one end and discharge it at the other, and by way of variety at both ends, so as to ventilate the interior and supply air for the furnaces at the same time. Formerly there was much inconvenience from impure air caused by bilge-water, and from decaying fragments of provisions and cargo; but this is so well understood and so easily remedied by keeping the ship dry and clean that the matter should no longer be of much interest, except as a matter of history.

Crowd-poison and typhus.—Poor ventilation and crowding, besides general ill health, cause typhus fever, a specific disease, and most fatal contagious pestilence. It seems that the mere perspiration of our bodies, unless promptly removed by free circulation of air, becomes very quickly a terrific poison (ochlesis, crowd-poison), which thus killed great numbers of our immigrants from Europe. Ships arriving with crowds of passengers had many deaths, and the sick were transferred to the quarantine stations, whence the disease was communicated to physicians and nurses at the hospitals; there were many deaths from this so-called ship-fever, until by Act of Congress (May 3, 1855), this was remedied. The law contains the following among other essential provisions:

1. The number of passengers shall not exceed 1 for each 2 tons measurement.
2. The apartments shall not be less than 6 feet in height.
3. Each passenger shall have from 14 to 18 feet of floor space, varying according to height and position, and giving about 100 cubic feet.
4. Every vessel with capacity for 100 passengers shall have 2 ventilators, 1 at each end, and 1 of them fitted with an exhausting cowl.
5. These arrangements are enforced by sufficient fines and other penalties.

Coolie ships.—Curious as it may seem, crowds of passengers have been smothered to death on board "coolie" ships, both English and American, within the last 25 years.

Water supply.—Pure water is essential to health and well-being; and generally there need be no difficulty in procuring it. Distilled water is even too pure, but by aëration and the slight mixture of sea-water, unavoidable, it becomes pleasant and wholesome; and, curious as it may seem, distilled water is generally cheaper than spring water. Formerly the supply of water was a difficult matter; it was carried in wooden casks, which occupied much space and spoiled the water, so that 4 or 5 pints a day was considered a liberal allowance of the disgusting fluid. The first great improvement was the introduction of iron tanks to preserve the water, and next the simple devices, not yet generally understood, for rendering distilled water palatable. The selection of spring-water calls for some care and judgment. There is no need here for any elaborate chemical analysis, as in arranging for city supplies. Limpid water from the hills is pretty surely good unless it has a decidedly objectionable flavor or a bad local reputation. It is important to avoid small streams in which clothes are washed, into which dirt is thrown, and streams which drain marshy land. This caution at first sight seems superfluous, but it is curious to see with what carelessness dirt is mixed with drinking-water nearly everywhere, from London to Memphis, as well as on shipboard.

Food.—The supply of suitable food is a real difficulty; we may carry salt beef and salt pork, hard bread and dry beans, flour and dried apples, tea and coffee, but no cabbage from the garden or other green thing. The importance of fresh vegetables is quite incomprehensible. In September, 1740, Lord Anson's fleet sailed from England, and in September, 1741, three of the ships reached the island Juan Fernandez, on the west coast of South America; of the 961 men who sailed 325 were alive; 636 had died mostly of scorbutus (sea-scurvy) during the passage around Cape Horn. The first boat that landed was loaded with grass and such weeds as came to hand. The poor invalids on board ate it up as delicious food, and rapidly regained their strength. This terrific record is in accordance with the experience of the time. The Spanish fleet attempting the same voyage at the same time fared about as badly, and the shattered remnant returned to Montevideo; not one of their seven vessels reached the Pacific, and about half the men died in the attempt.

Improvements.—This difficulty in long voyages being understood, there has been a steady improvement to the present time. Cook's voyages of exploration, the third of a century later, were made with very little loss of life; this is partly due to improved knowledge and hygienic care, and partly to the fact that the passages were short from one landing-place to the next, and much of the time was spent about lands where fruits and fresh vegetables were procurable. At present it is no rare thing for a ship with 200 or 300 men to round Cape Horn, make a three years' cruise in the Pacific, bringing home every man that sailed in her; and there is no one or two great things to be pointed out as the cause of this great difference. There is a better and more abundant supply of food, better discipline, more thoughtfulness, more intelligent attention to small things. We can mention only a few of the more important changes.

Flogging abolished.—The abolition of flogging, after many regulations mitigating and rendering it less necessary, came in accordance with the demands of public sentiment (1850). This gave the men spirit to think themselves somewhat better than beasts, and they behaved better accordingly. It did much to infuse new life into the degraded men; it prevented the novices from reaching such a degree of degradation; and now the other tortures invented to supply its place are gradually passing to oblivion.

The liquor ration abolished.—The abolition of the liquor ration (1862) was still more important. This had to be gradual. For twenty years or

more the allowance was reduced from time to time, with coffee and tea, and many other things experimentally supplied as substitutes. The cessation of drunken habits has rendered it possible to indulge sailors with frequent liberty on shore, without the filth and disorder formerly in fashion. There is ten times as much liberty, with perhaps one-tenth as much syphilis.

Coffee and spices.—Furthermore this great improvement—from 650 deaths per 1000 in Lord Anson's fleet to 4 or 5 per 1000 in late official reports—has come by more persistent care about small things. Ground coffee, formerly supplied by contract, was a vile mixture of spoiled coffee, with beans and chicory, etc., parched and ground together. The mustard called English mustard was mostly starch and saw-dust, with potassium bichromate enough to make it pungent; the whole seeds are now purchased and manufactured under responsible supervision.

Fresh bread and early coffee.—The hard bread on board is now varied by a constant supply of fresh bread; a competent "ship's baker," with his oven, belongs to the complement of every ship in the navy. Congressional legislation (May 23, 1872), in its liberal supply of coffee, has even prescribed the proper time to use it,—"an additional ration of coffee and sugar to be served at his first turning out." The man who is obliged to spend the morning hours from 5 o'clock to 8 A.M. in scrubbing decks and making things neat till breakfast-time fully appreciates this preliminary bread and coffee.

Naval experience has made important contributions to medical science and general hygiene, as appears by the accumulating reports of medical officers; perhaps the most important of these has reference to malarial fevers. When the distinctions between the deadly marsh fevers of the tropics and yellow fever were hardly suspected, Dr. Badenoch, July 7, 1768, read a paper on this subject before the Royal Society of Edinburgh. His ship had been at the Comore Islands (Mozambique Channel) for ten days, and a few days after sailing many men sickened and died in quick succession; of course it was generally thought to be a terrible contagious pestilence that destroyed lives in this way, but "I observed that none suffered of those who returned on board to sleep every night." All those who were on shore at night suffered; all who came aboard to sleep escaped. Lind published very similar incidents, and subsequent experience all accords with this. Hence the well-established facts: malarial poison infects only at night, and the incubation period is not less than twelve or fourteen days. If we wish to learn when or how a patient contracted his disease, we need not ask where he was last night or yesterday, but where he spent his nights two weeks ago. Even medical men of eminence do not always keep these things in remembrance; for instance, in an admirable work on military hygiene (1860) there occurs such a slip as this: "The malaria seems to be principally active at night, as many men are attacked while on post early in the morning." The men had probably been thus exposed every night for two weeks or more. And again (1878), we read of a national vessel at Monrovia, Liberia; in three or four days after anchoring there were numerous cases of malarial fever on board; and hence the inference that the vessel is anchored too near the marshy shore, the fact being quite neglected that two weeks previously the ship was at Porto Praya, and probably the disease was contracted there.

Bibliography.—The most important books on this subject are the volumes of official reports of naval surgeons published by public authority nearly every year. Armstrong, "Naval Hygiene," 1858; Blane, "Dissertations," 3d ed., 1803; Clarke, "Long Voyages," 1792; Carpenter, "Use and Abuse of Alcohol"; Dunglison, "Human Health"; Fonssagrives, "Traité d' Hygiene Navale," 2d ed., 1877; Forget, "Naval Medicine," 1835; Gihon, "Naval Hygiene," 1873; Hammond, "Military Hygiene," 1863; Larrey, "Surgical Memoirs"; Lind, "Marsh Fevers of Bengal," pamphlet, 1770; Lind, James, "On Scurvy," London, 1757; Lind, James, "Diseases in Hot Climates," Philadelphia, 1811; Maher, "Hygiene Navale," 1874; Plimsoll, "Our Seamen," 1873; Turnbull, "Naval Surgeon," 1806; Turner, "Hygiene, Naval and Merchant," in Buck's "Hygiene," 1880; Wilson, "Naval Hygiene," 2d ed., 1879.—*Joseph Wilson, M.D., Medical Director U.S.N.*

Hygrometer (Gr. *hugros*, moist; *metrein*, to measure). An instrument for measuring the moisture of the atmosphere. The simplest form consists of a combination of two thermometers, the bulb of one being kept dry and that of the other wet. The wet bulb is cooled by evaporation as much as the state of the atmosphere admits. In a very moist atmosphere there will be little or no difference in the readings of the two thermometers, but when the atmosphere is dry the wet-bulb thermometer will show a temperature lower by several degrees than that shown by the dry-bulb thermometer.

I.

Icarus. The son of Dædalus, who, flying with his father out of Crete into Sicily, and soaring too high, melted the wax of his wings and fell into the sea, thence called the Icarian Sea.

Ice. Water or other liquid made solid by cold. Water freezes at 32° F., and in freezing expands rapidly and with great force. In consequence of this expansion the ice becomes lighter than water, and floats with one-ninth of its mass above water.

ICE-ANCHOR. A bar of round iron tapered to a point, and bent as a pot-hook; a hole is cut in the ice, the point entered, and a hawser bent to the shorter hook; by this vessels ride safely till any motion of the ice capsizes it, and then it is hauled in. The ice is usually entered by a lance, which cuts its hole easily.

ICE-BEAMS. Strengtheners for whalers.

ICEBERG. An insulated mountain of ice, whether on Arctic lands or floating in the sea. Some have been known to be aground in 1500 feet water, and rise to the height of 250 feet above it. Cook's obtaining fresh water from floating icebergs was not a new discovery. The Hudson's Bay ships had long made use of it; and in July, 1585, Capt. Davis met with ice "which melted into very good fresh water."

ICE-BIRDS. Small sea-fowl in the polar regions.

ICE-BLINK. A streak or stratum of lucid whiteness which appears over the ice in that part of the atmosphere adjoining the horizon, and proceeds from an extensive aggregation of ice reflecting the rays of light into the circumambient air.

ICE-BOAT. A heavy boat with great steam-power, for breaking a passage-way through ice. A boat fitted with runners shod with iron for sailing on the surface of the ice. They have one large sail, and lie up very close to the wind. In this situation their speed is greater than the velocity of the wind.

ICE-BOUND. A vessel so surrounded by ice as to be prevented from proceeding on her voyage.

ICE-CHISEL. A large socket-chisel into which a pole is inserted, used to cut holes in the ice.

ICE-CLAWS. A flat claw with two prongs spread like a can-hook.

ICE-FENDERS. Fenders of any kind, used to protect a vessel from injury by ice.

ICE-LANE, or ICE-VEIN. A narrow temporary channel of water in the packs or other large collections of ice.

ICE-MASTER. A pilot, or man of experience, for the Arctic Sea.

ICE-PLANK. See SPIKE-PLANK.

ICE-QUAKE. The rending crash which accompanies the breaking of floes of ice.

ICE-SAW. A huge saw for cutting through ice; it is made of $\frac{5}{8}$ to $\frac{3}{4}$ inch plates of iron, and varies in length from 10 to 24 feet.

ICE-SLUDGE. Small comminuted ice, or bay-ice broken up by the wind.

ICE-TONGUE. A mass of ice projecting horizontally under water from an iceberg or floe.

Ichthyosaurus (Gr. *ichthus*, a fish, and *sauros*, a lizard). A genus of extinct marine animals which combined the characteristics of Saurian reptiles and of fishes, with some of the peculiarities of the Cetacea. The head was large, and resembled in structure that of the crocodile, except that the orbit was much larger, and the nostrils were placed, not as in the crocodile near the point of the snout, but close to the anterior part of the orbit. The teeth, conical in shape and hollow, were lodged close together in a continuous groove, in which the divisions for sockets, which exist in the crocodile, were indicated by the vertical ridges on the maxillary bone. The most remarkable feature in the head was the eye, which was not only very large,—in some specimens measuring 13 inches in diameter,—but was specially fitted to accommodate itself for vision in air or water, as well as for speedily altering the focal distance while pursuing its prey. The structure which thus fitted the eye so remarkably to the wants of the animal consisted of a circle of 13 or more overlapping sclerotic bony plates surrounding the pupil, as in birds. This circle acted as a sort of self-adjusting telescope, and with the extraordinary amount of light admitted by the large pupil, enabled the ichthyosaurus to discover its prey at great or little distances, in the obscurity of the night, and in the depths of the sea. The body, shaped like that of a fish, was furnished with limbs developed into paddles, and terminated in a long lizard-like tail, which is supposed to have been supplied with a vertical fin.

From the form and position of masses of crushed and apparently half-digested fish-bones and scales in the abdominal cavity of the ichthyosaurus, it is concluded that it preyed chiefly on fish.

The remains of the ichthyosauri are peculiar to the Secondary strata. They occur in the various members of the series from the Lower Lias to the Chalk, but have their greatest development in the Lias and Oolite. More than 30 species have been discovered, differing from each other mainly in the form of the head, some having a long and slender snout, like the gavial of the Ganges, and some a short and broad head, more like the common crocodile.

Ick. A term for a creek or gullet.

Ide. A small fish (*Leuciscus idus*) allied to the graining, and found in the northern parts of Europe.

Idler. A general designation for all those on board a ship-of-war who are not required to keep watch on deck. A cog-wheel placed between two others to communicate the motion of one to the other; by its interposition they are caused to revolve in the same direction.

Idoleers. The name by which the Dutch authorities are known in their oriental colonies,

the designation being a corruption of *edle herren.*

Ignorance. If a loss happen through the ignorance of the master of a ship, it is not considered as a peril of the sea, consequently the assurers are not liable. Nor is his ignorance of admiralty law admissible as an excuse.

Iguana. A lizard used for food in tropical climates.

Ilde. An archaic term for *island.*

Ilet. See EYELET.

Immer. The *Colymbus immer* of Linnæus; the great plunger of Buffon.

Immersion (Lat. *immergere*, to plunge in). The commencement of an occultation, or the moment when the occulted body disappears behind the nearer one.

Imp. One length of twisted hair in a fishing-line.

Impact (Lat. *impingere*, *impactum*, to push, strike against). In mechanics, the single, instantaneous blow or stroke of a body in motion against another, either in motion or at rest.

Impetus (Lat. *force*, from *impetere*, to rush upon, attack). In mechanics, nearly synonymous with momentum, yet differing from it as indicating the origin and intensity of motion, rather than its quantity or effectiveness. In gunnery, impetus is the altitude through which a heavy body must fall to acquire a velocity equal to that with which the ball is discharged from the piece.

Imports. The articles brought into the country in the course of commercial transactions. By the articles for the government of the navy all persons connected with the navy are forbidden to import in a naval vessel any thing which is liable to the payment of duty.

Impressment. The act of seizing for public use, or of impressing into public service; compulsion to serve. In England impressment was formerly a means much resorted to for supplying the royal navy with seamen. The practice, according to Lord Mansfield, was "deduced from that trite maxim of the constitutional law of England, 'that private mischief had better be submitted to than that public detriment and inconvenience should ensue.'" Seamen, river-watermen, and at times landsmen were the customary victims of this arbitrary procedure. A press-gang could board a merchant vessel or privateer of its own nation in any part of the world, and carry off as many men as could be taken without actually endangering the vessel. Although the laws which sanctioned impressment have not been repealed, the adoption of a system of bounties has in recent times proved a sufficiently effective means of procuring seamen without recourse to the oppressive practice of former years. One of the principal causes of the war between this country and England (1812–15) was the assertion by the latter of a right to impress English seamen out of American vessels on the high seas, thus elevating a practice which derived its warrant solely from the municipal law of England into a right sanctioned by the law of nations. This asserted right, sufficiently aggravating when confined in practice, as it was in theory, to subjects of Great Britain serving in American ships, became intolerable when extended to native-born-Americans owing no allegiance to the British crown. This was constantly done, the English boarding-officers acting, in effect, on the principle that the seaman who failed to prove that he was an American should be seized as an Englishman, and it has been authoritatively stated that the number of impressed Americans on board British ships of war was seldom less than the entire number of seamen in the United States navy between the years 1802 and 1812. On the declaration of war in the latter year, the number that was turned over to the prison-ships for refusing to fight against their own country is said to have exceeded 2000. Impressment has never been adopted in our country. There is nothing (remarks Judge Tucker) in the Constitution of the United States which warrants a supposition that such a power as that of impressment can ever be authorized or exercised under the government of the United States. On the contrary, the principles of the Constitution and the nature of the government strongly militate against the assumption or countenancing of such a power.

IMPRESS-GANG. A party of officers and men engaged in the act of impressment. More commonly called *press-gang.*

Impulse. In mechanics, the single or momentary force by which a body is impelled, in contradistinction to continued force; force communicated without appreciable gradations; motion produced by suddenly communicated force.

In. Within; on board. The situation of a sail when it is furled; *to take in* a sail, to clew it up preparatory to furling. *In boats!* the order to hoist in the boom-boats. *In bows!* the order to the bow-oarsmen to lay their oars in. *In the wind*, the situation of a ship so close to the wind that the sails shiver.

In-and-out Bolts. The bolts that are driven through the ship's side.

Inboard. Within the hull of a vessel. Nearer the centre-line.

Incendiary Shell. A shell filled with a highly-inflammable composition, for the purpose of setting fire to buildings; a carcass.

Inchcape Bell. Tradition says that the abbots of the ancient monastery of Aberbrothrock fixed the bell in such a manner that it was rung by the heaving of the sea, thus warning mariners of their danger. Tradition also tells us that the bell was carried away by a Dutchman, who, with his ship and crew, was afterwards lost upon the rock. The site is now occupied by a fine light-house, which was erected in 1806–10.

Incidence, Angle of. A term which is used by writers on Mechanics and Optics in different senses. Thus, in the case of a body striking against a plane the angle of incidence is by some understood to signify the angle formed by the line in which the body moved with a straight line perpendicular to the plane; while others use the term to denote the angle which the line of incidence makes with the plane itself. When light or any elastic body is reflected from a surface, the angle of incidence is equal to the angle of reflection; and in case of refraction, the sine of the angle of incidence has to the sine of the angle of refraction a constant ratio.

Inclinatory Needle. An old term for the *dipping needle* (which see).

Inclined-cylinder Steam-engine. One in which the axis of the cylinder is inclined to the

horizon, in contradistinction to the horizontal and vertical types. Called also *inclined-engine.*

Incompetency, or Insufficiency. A bar to any claim on warrantry, as it is an implied condition in the seaworthiness of a ship that at sailing she must have a master of competent skill, and a crew sufficient to navigate her on the voyage.

Incrustation. The deposit from the water, adhering to the inside of a boiler. See SCALE.

Indemnification. A stipulated compensation for damage done.

Indemnity. Amnesty; security against punishment.

Indentures, Pair of. A term for *charter-party.*

Independence, Declaration of. The written instrument adopted by the Continental Congress assembled at Philadelphia on the 4th of July, 1776, whereby the 13 American colonies declared their independence of the crown of Great Britain. This memorable instrument asserts the right and duty of a people, whenever their form of government becomes destructive of the ends for which governments are instituted, to wit: the security of life, liberty, and the pursuit of happiness, to throw off such government and to provide new guards for their future security. It recapitulates the oppressions of the British king, and closes with the following solemn appeal and declaration: "We therefore, the Representatives of the United States of America, in General Congress Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions, do, in the Name, and by Authority of the good People of these Colonies, solemnly publish and declare, That these United Colonies are, and of right ought to be, Free and Independent States; That they are Absolved from all Allegiance to the British Crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved; and, that as Free and Independent States, they have full Power to levy War, conclude Peace, contract Alliances, establish Commerce, and to do all other Acts and Things which Independent States may of right do. And for the support of this Declaration, with a firm reliance on the Protection of Divine Providence, we mutually pledge to each other our Lives, our Fortunes, and our sacred Honor."

Index. The flat bar which carries the index-glass of a quadrant, octant, sextant, etc. The integer part of a logarithm.

INDEX-ERROR. A correction to be applied to the reading of an astronomical instrument. See SEXTANT.

INDEX-GLASS. A mirror which moves with the index of an astronomical instrument, and reflects the image of the sun or other object upon the horizon-glass, whence it is again reflected to the eye of the observer.

Indiaman. A term occasionally applied to any ship in the East India trade, but in strict parlance the large ships formerly officered by the East India Company for that trade, and generally armed.

Indicator. An instrument, originally invented by Watt for recording, by means of a diagram, the pressure per unit of area upon the piston of a steam-engine at all points of its stroke. From the diagram, which is drawn upon a piece of paper called an *indicator card*, the mean pressure throughout the stroke may be ascertained, and mal-adjustment of valves or leakage through valves, piston, or other parts of the cylinder detected. The instrument consists essentially of a small vertical cylinder, open at the top and communicating at the bottom with the engine-cylinder, provided with a delicately-fitting piston of accurately determined area, which is held in position by a spiral spring of known tension, so that the pressure of steam on the bottom of the piston or that of the atmosphere on the top will be indicated by a pencil attached to a rod of the small piston by suitable mechanism. The pencil is brought to bear upon a piece of paper closely wrapped around a cylinder, which is caused to partially revolve in alternate directions by a motion coincident with that of the piston of the engine while the pencil is moving up and down, thus describing an irregular continuous line inclosing a space, the area of which represents the unbalanced pressure on the engine-piston. The vertical ordinate of any point of the line, when measured with a scale corresponding to the stiffness of the spring, indicates the pressure per unit of area at that point, and the mean of a number of ordinates gives the mean pressure throughout the stroke.

INDICATOR CARD. A piece of paper on which an indicator diagram is drawn. Upon the card should be noted the pressure of the steam per gauge in the boilers; the vacuum in the condenser per gauge; reading of barometer; the revolutions of the engines per minute; the relative amount of opening of the throttle-valve; temperatures of the air, injection- or sea-water, discharge-water, and hot-well; the direction and force of the wind relative to the ship; the state and direction of the sea; the amount of sail set; and any abnormal condition of the machinery. These notes should be made at the instant the diagram is taken, and the card should bear the name of the vessel, the date, and the exact hour and minute of taking.

Indraught. A particular flowing of the ocean towards any contracting part of a coast or coasts, as that which sets from the Atlantic into the Straits of Gibraltar. It usually applies to a strong current apt to engender a sort of vortex.

Induction-pipe. The main steam-pipe of the steam-engine, conducting steam from the boiler to the steam-chest.

Induction-valve. The main steam-valve, or valve admitting steam from the steam-chest to the cylinder.

Indulto. The duty formerly exacted by the crown of Spain upon colonial commodities.

Indus. See CONSTELLATION.

Inertia (Lat. *iners*, slothful). That inherent property of matter which renders all bodies absolutely passive or indifferent to a state of rest or motion, so that they would continue forever at rest, or persevere in the same uniform and rectilinear motion, unless disturbed by the action of some extrinsic force. The ancients attributed to matter a certain inaptitude or reluctance to motion; but that a body in motion required the operation of an extrinsic cause to bring it to rest was first discovered by Galileo. Kepler, conceiving the disposition of a body to maintain its motion as indicating an exertion of power, prefixed the word *vis;* and the compound expression *vis inertiæ*, though less accurate, has been generally retained.

Inferior Conjunction. See CONJUNCTION.

Inferior Planets. See PLANETS.

Ingraham, Duncan Nathaniel, Captain U.S.N. Born in Charleston, S. C., December 6, 1802; died there June 10, 1863. Midshipman, June 18, 1812; lieutenant, April 1, 1818; commander, May 24, 1838; captain, September 14, 1855. Nathaniel, his father, was a friend of Paul Jones, and was in the action with the British brig "Serapis." His uncle Joseph, Captain U.S.N., was lost at sea in the U. S. ship "Pickering." His cousin, William, a lieutenant in the navy, was killed at the age of 20. Capt. Ingraham married Harriet R., granddaughter of Henry Laurens. His seizure of Martin Kostza, an American citizen, from the Austrian brig-of-war "Hussar," at Smyrna, July 2, 1853, gave rise to an elaborate discussion at Washington between M. Hulseman, the Austrian chargé d'affaires, and Mr. Marcy, Secretary of State. Congress, by joint resolution, August 4, 1854, requested the President to present a medal to him for his conduct on this occasion. In March, 1856, he was appointed chief of the Bureau of Ordnance and Hydrography, which position he resigned February 4, 1861, and was made chief of ordnance, construction, and repair in the Confederate navy.

Inia (*Inia Boliviensis*). A cetaceous animal of the family *Delphinidæ*, in form resembling a dolphin, with a long and slender snout. It is the only known species of its genus, and is one of the few Cetacea which inhabit fresh water. It is found in some of the upper tributaries of the Amazon and in the lakes near the Cordilleras. It is from 7 to 12 or 14 feet long. Its food consists of fish. It is generally found in little troops of three or four, and is taken for the sake of the oil which it yields. The females show great affection for their young.

Initial Velocity. See VELOCITY.

Injection. In the steam-engine, a stream or jet of water admitted to the condenser for the purpose of condensing the steam after having performed its work.

INJECTION-COCK, or INJECTION-VALVE. A cock or valve by which the quantity of injection-water is governed.

INJECTION-, or JET-CONDENSER. A condenser in which the refrigerating water comes in direct contact with the steam and mingles with the water of condensation. See CONDENSER.

INJECTION-PIPE. A pipe that conducts the refrigerating water to the condenser of a steam-engine.

Injector. An instrument for supplying feed-water to steam-boilers, the action of which depends upon fluid friction or "induction," and the energy due to the latent heat of steam being transferred to a stream of water. In the simplest form of the instrument, a small jet or stream from the boiler is projected from a tube passing partly through a chamber, to which is attached the water-supply pipe, into a conical or bell-mouthed tube of larger dimensions, which passes into another chamber provided with an overflow, and terminates at the entrance of the discharge-pipe leading to the boiler. The discharge-pipe is provided with a check-valve, and the steam-jet and water-supply are adjusted by suitable mechanism. When started in operation, the steam-jet, by its friction or adhesion, exhausts the air or vapor, if any, from the supply-pipe and chamber, ejecting it through the overflow; the water fills the vacuum, and, passing through the annular space between the nozzle of the jet-pipe and the conical tube, comes in contact with the steam and condenses it; the energy due to the weight and high velocity of the steam is, after condensation, transmitted to a greater weight of water, the combination moving at a slower velocity, the heat extracted from the steam by condensation being the means of such transmission, enabling the stream to overcome a much greater resistance than that due to the pressure which supplies the steam-jet. The overflow permits the escape of any excess of steam or water resulting from lack of proper adjustment. The weight of water delivered relative to that of the steam consumed may be considered as a function of the difference between the temperature of the stream and the total heat of the steam. There are several designs of the instrument, their difference depending principally upon proportions and mechanism for adjustment; but none are considered reliable when hot feed-water is used.

Injuries to Cannon. The injuries from the powder generally occur in the rear of the projectile. They consist of enlargement of the bore; cavities produced by the melting of a portion of the metal by the heat generated by the combustion of the charge; cracks; and furrows or scoring produced by the erosive action of the gases.

The injuries from the projectile consist of an indentation at the seat of the projectile, and a corresponding burr in front of the projectile; enlargements formed by the balloting of the projectile in the bore and at the muzzle; scratches and cuts made by an imperfect projectile or by the fragments of broken ones; wearing away of the edges of the lands; and cracks on the exterior.

Ink-fish. The cuttle-fish (which see).

Inland Sea. A very large gulf surrounded by land, except at the communication with the ocean, as the Baltic, Red, and Mediterranean Seas.

Inland Trade. That which is wholly managed at home, and the term is in contradistinction to commerce.

Inlet. A term in some cases synonymous with *cove* and *creek*, in contradistinction to *outlet*, when speaking of the supply and discharge of lakes and broad waters, or an opening in the land forming a passage to any inclosed water.

Inman, William, Commodore U.S.N. Born in New York. Appointed midshipman from New York, January 1, 1812; served on the lakes during the war of 1812, afterward on the Atlantic.

Commissioned as lieutenant, April 1, 1818; served in the Mediterranean and on the Atlantic in 1823; commanded one of two boats capturing a pirate vessel mounting 3 guns, on the coast of Cuba; from 1834–37 served as executive-lieutenant of a flag-ship frigate in the Pacific.

Commissioned as commander, May, 1838; commanded steamer "Michigan," on the lakes, 1844–46.

Commissioned as captain, June 2, 1850; commanded steam-frigate "Susquehanna," 1851; from 1859–61, commanded the African Squadron which recaptured and landed in Liberia 3600 slaves. Retired December 21, 1861.

Commissioned as commodore, March 12, 1867. Died, 1872.

Inner Post. Worked on the inside of the main post running down to the throat of the stern-post knee.

Inquiry, Court of. A court of inquiry is held by the same authority as a general court-martial; that is, may be ordered by the President, the Secretary of the Navy, or the commander of a fleet or squadron without restriction as to "express authority."

Their origin is not found in law, but in the exercise of kingly prerogative. Custom grafted them into the military judicature of England, and the United States did not provide for them by statute (although they were probably held earlier) until April 23, 1800. It is gratifying to say that the laws relating to their organization and powers have not undergone the slightest change since then. Their object is to ascertain facts in complicated or difficult cases for the information of superior authority. They may be convened to establish responsibility, or criminality, as a preliminary proceeding to trial by court-martial, or to clear up matters of public welfare; or to exculpate individuals believing themselves aggrieved. In any case, they record, sift, and methodize the information obtained, and upon their report is determined whether or not further action is necessary or expedient.

The functions of courts of inquiry are therefore semi-judicial, and their proceedings are marked by great precision, though, as regards documentary evidence, the same strictness does not prevail as in courts-martial. Their duties depend almost entirely upon their instructions, which should be minute and definite, and the procedure is that of courts-martial so far as applicable. Being assimilated to, and held in many respects in the light of a grand jury, its members are, as a rule, disqualified to sit as "judge and juror" in the court-martial which may follow. Whether they give the facts of the case only, or an opinion, they are held to have been exposed to impressions which might operate against a fair trial of the accused.

"A court of inquiry shall consist of not more than three commissioned officers as members, and a judge-advocate, or person officiating as such." (Rev. Stat., Sec. 1624.) They have power to summon witnesses, administer oaths, and punish contempts in the same manner as courts-martial, but they shall only state facts, and shall not give their opinion unless expressly required so to do in the order for convening.

In all investigations, the party whose conduct is the subject of inquiry and his counsel have the right to be present, to challenge members, to address the court, and cross-examine all of the witnesses. His presence is not obligatory, but is customary and advisable. He is usually called before the court; also the complainant (if there be one), before the subject to be investigated is announced. The judge-advocate administers to the members the oath, or affirmation, "well and truly to examine and inquire" into the matter before them (see Oaths), after which the president swears the judge-advocate to keep "a true record," etc. It will be observed that this order of administering the oaths is exactly the reverse of that prescribed by law for general courts-martial, and that for general courts is the reverse of that for summary courts, and that for an army general court is the reverse of that for a navy general court; and yet any departure from the order laid down in either case would, of course, be illegal.

These courts hold open sessions unless there be good reason to the contrary, which they decide when not anticipated by the convening authority. There is no statute of limitations for them. Two very notable and illustrative courts recently assembled in the State of New York (1878–80) upon the personal applications of Fitz-John Porter and Lieut.-Col. G. K. Warren, U.S.A., who were major-generals of United States Volunteers during the Rebellion of 1861–65, to examine into and review their military conduct at that time. Civil and military witnesses of all ranks, many of whom had served in the opposing army, were summoned from all parts of the country, and subjected to crucial examinations.

When a court is ordered to report *facts*, it does not mean the testimony simply, "but the result and conclusion of the court from hearing the evidence." An *opinion* is held by the Navy Department to be different from a "conclusion," and to relate to the merits of the case. The proceedings of a court are authenticated by the signatures of the president and judge-advocate, and "in all cases not capital, nor extending to the dismissal of a commissioned or warrant-officer," may be evidence before a court-martial, provided oral testimony cannot be obtained.

Courts of inquiry cannot award punishment, and are dissolved by the authority which ordered them to convene. "A commanding officer acting singly" has no power to order a court of inquiry, but can order a board of three officers to investigate any casualty, occurrence, or transaction in regard to which the government should be informed. Commanders of squadrons are required to order courts of inquiry promptly whenever called for, and transmit proceedings without delay to the Secretary of the Navy.—*Henry C. Cochrane, Captain U.S.M.C.*

Inshore. Toward the shore; nearer the shore.

Inspection. Solving a problem by inspection is the obtaining the result at once by looking into a table, the arguments of which are the data of the problem. Though few problems can be wholly solved in this manner, still the method is used in the different steps and portions of nearly every problem in navigation.

Inspection, Board of. A board was convened for the first time in our navy in 1870, at the instance and under the direction of Admiral Porter. Its purpose is to inspect all vessels of war going on, or returning from, a cruise, and it was at first composed of three line-officers of rank and experience. At present its composition is 1 commodore, 2 captains, 1 medical and 1 pay inspector, 1 chief engineer, 1 captain of marines, and a recorder.

When visiting a vessel the board is received with the honors due its senior officer.

The first step in the inspection is the assembling of the officers and crew at quarters, every part of the ship being thrown open. Her decks, holds, store-rooms, engine- and fire-rooms, magazines and shell-rooms, and every part of the vessel, with her various fitments, are closely scrutinized. She is then "cleared for action," and the battery provided in accordance with the

ordnance instructions. The officers in charge of divisions and departments report their readiness for battle to the executive-officer, who in turn reports to the commander,—the guns and implements for serving them are carefully inspected.

The board then directs the exercises, consisting of loading and firing; fighting one and both sides at the same time. The assembling of boarders, riflemen, and pikemen; of boarding and repelling the enemy. Injuries to gun-carriages, their tackling or implements, provided for. One or more guns are shifted from one carriage, port, or side to the other. Spars and rigging supposed to be shot away or wounded replaced or repaired. Shot-holes and leaks stopped. Fire incident to battle extinguished. Torpedoes fitted and exploded. The supply and character of powder charges and projectiles examined. The use of small-arms and Gatling-guns by marines and seamen, and other expedients for purposes offensive and defensive.

The boats are then armed and equipped for "distant service," with their respective details, and are exercised under sail and oars in the various evolutions of fleet movements of attack and landing,—in the latter case the crews are organized to form a battalion, with a battery of howitzers or Gatling-guns.

The spar and sail exercises are then had, consisting of sending down and up light masts and yards, of making and reducing sail, reefing topsails and courses, and shifting the same by unbending one set and bending another. The extinguishing of fire when not engaged in battle closes the exercises.

The watch-, quarter-, and station-bills, quality of clothing and provisions for the crew, are closely inspected, as well the engines, boilers, and their appurtenances, and whatever may tend to affect the health of the crew.

Some of the above exercises are dispensed with in ships newly commissioned.

The results of the inspection are reported in duplicate to the admiral of the navy by the senior officer. The admiral forwards a copy to the Navy Department with such recommendations as may to him seem advisable.

It is obvious that it being known to the navy-yard authorities where a ship is fitted out, and to the officers and men attached to a vessel that such an inspection is inevitable, stimulates them to do their utmost to render her efficient.—*J. H. Upshur*, *Commodore U.S.N.*

Instance Court (*Eng.*). A department of the admiralty court, governed by the civil laws of Oleron, and the customs of the admiralty, modified by statute law.

Insulated Wire. A wire suspended by insulators, as the ordinary telegraph-wire. Wire covered with some insulating material, as gutta-percha, Hooper's material, etc. See CABLE, ELECTRICAL.

Insulator. A substance of relatively small conductivity. See ELECTRICITY.

Insult. In a military sense, to attack boldly and in open day, without going through the slow operations of trenches, working by mines and saps, or having recourse to those usual forms of war, by advancing gradually towards the object in view. An enemy is said to insult a coast when he suddenly appears upon it and debarks with an immediate purpose to attack.

Insurance. See MARINE INSURANCE.

Insured. The party who obtains the policy and pays the premium.

Insurer. The party taking the risk of a policy. See UNDERWRITERS.

Intercalary Day. See DAY, INTERCALARY.

Intermediate-shaft. The shaft crossing the frame of a marine engine between the two engines and connecting the two paddle-shafts, sometimes applied to counter-shafts.

Internal Contact. This, in a transit of Mercury or Venus across the solar disk, occurs when the planet is just within the sun's margin.

Internal Planking. This is termed the *ceiling* of the ship.

Internal Safety-valve. A valve on a boiler opening inward by excess of external pressure to prevent collapsing in case the internal pressure of steam becomes reduced by condensation much below the pressure of the atmosphere. Called also *reverse valve* and *vacuum valve.*

International Law. 1. *Sources, authority, sanction.*—International law is a collection of rules governing the intercourse of civilized states. The rules are derived partly from general principles of right and justice, and partly from considerations of general convenience. The safest method of determining them is by induction from the widest and most lasting usage. Usages vary considerably at different periods, and in the practice of different states, but no usage is likely to be lasting which is opposed either to justice or the general convenience. In cases of conflicting usage, the preference must be given to that which accords most nearly with these two final tests. This process does not always bring about a uniform result, because there is no single authority to pronounce finally upon the validity of any given rule, and individual views of justice and of the general good are apt to be clouded by considerations of individual interest. But in the present state of international relations it affords the nearest method of approach to a universal public law. There is no international legislature to formulate the law, no common judiciary to interpret it, and no executive to enforce it. Hence it is somewhat variable and shifting, both in principle and practice. Its authority is derived from the general consent of nations, tacit or express. Its doctrines are laid down with more or less variety in the works of text-writers, in state papers, in the decisions of courts, and occasionally in statutes and treaties, though the last more frequently embody exceptions to the law than rules of the law. It is enforced by the governments of independent states acting separately or by their agents. Of sanctions, in the sense of a penalty attached to the law for its violation, international law knows little. Acts in violation of international law, committed by individuals, are punished by the government having jurisdiction over the offender, if its laws take cognizance of the offense; and, in some cases, as breaches of blockade, or carrying contraband, by a judicial confiscation by courts of the injured state. But in the first case it is a breach of municipal, not of international, law that is punished, and in the second the penalty is inflicted by a tribunal whose authority is derived wholly from the injured state. Where governments or the states they represent are the offenders, there are no sanctions except public opinion and war; the first of which can be called a sanction only

by a figure of speech, and the second is one that benefits only the stronger party. War is a penalty that cannot be successfully imposed by a weak state upon a powerful one, where the latter has violated its international duties. The same is true, though to a less extent, of reprisals.

In determining the rules of international law, the greatest reliance is to be placed upon state papers and decisions of courts, as embodying principles adopted to meet actual cases and carried out in actual practice. In the former, however, allowance must be made for the interested leanings of statesmen who are advocating a cause, rather than judging impartially both sides of a question. Even in the decisions of courts, a certain partiality for national views of public policy is almost unavoidable. Treatises are valuable guides, but, as their authors are under no responsibility, they may give way to speculative tendencies, and they often fail to distinguish between the law as it actually is and their views of what it ought to be. Even here it is necessary to know the nationality of the writer, for each nation has its own school of publicists, who view the law largely from an interested stand-point. The principal authorities are Halleck, Kent, Wheaton, and Woolsey in the United States, Phillimore, Twiss, Ward, and Manning in England, Heffter in Germany, and Ortolan and Hautefeuille in France, though the last advocates a theory of international law which is far from receiving general support. The best modern treatise is that of Calvo, a South American, published in French and Spanish. Treaties sometimes contain statements or definitions of rules of international law, but they are only binding upon the parties to the treaty. Treaties in which a large number of states have united in the adoption of a rule, as in the Declaration of Paris of 1856, sometimes go far towards fixing or modifying a hitherto unsettled doctrine.

2. *States and their attributes.*—As international law governs the intercourse of states, it is upon states as units, rather than upon individuals, that the law primarily operates. But it also concerns closely certain officers as agents of states, and citizens who are brought into relation with governments other than their own. A state is a collection of persons united by a political organization, occupying a fixed territory, and subject in its relations to other political bodies to no recognized control or authority outside of its own organization. The supreme control which a state, through its government, exercises over all its concerns is called sovereignty. This attribute of states is a thing independent of forms of government. It resides in the body or bodies to which the state by its constitution or organic law has deputed the powers of government, and which are designated collectively as *the sovereign.* The sovereign may be an individual, as in an absolute monarchy, or it may be an assemblage of individuals or bodies of varying complexity and organization, as in most modern states. There are two kinds of sovereignty,—internal sovereignty, which concerns the interior administration of a state, and external sovereignty, which concerns its foreign relations. From one or the other all the particular powers of government are derived; but it is with the second alone that the system of international law has to do. In a newly-established state the acknowledgment of its independence by other states, or *recognition*, as it is called, is necessary to the full exercise of external sovereignty. The question of according this recognition in doubtful cases is a question of policy rather than of law; but when the new state gives sufficient assurance of permanence, recognition generally follows as a matter of course. In a civil war, when two parties are contending for power, the question arises which of the two parties shall be recognized by foreign states when each claims to be exercising the powers of government. Here again the question is largely one of policy, as long as the issue is doubtful, but it is the general practice for foreign states to recognize, in the end, the government *de facto* without inquiring into the justice of its foundation.

For certain limited and temporary purposes, a government may sometimes be recognized without the recognition of the state which it represents. This case only arises when a civil war or insurrection has assumed extensive proportions, and it becomes necessary to maintain relations with the insurgents analogous to those between state and state. Such a limited and partial recognition is known as "recognition of belligerency," and it only lasts during the continuance of the civil war or insurrection. It exists only for war purposes, and its effect is to place both parties to the contest on the footing of belligerents, with all the rights and duties towards each other and towards neutrals that result from such a condition.

From the possession of sovereignty flow the three primary rights of states. These are the rights of self-preservation, of independence, and of equality. The right of self-preservation is the right of every state to take hostile measures to protect itself from foreign aggression. The right of independence is the right of a state to manage its own concerns without interference or dictation from without. The right of equality is that by which all states are equal before the law; that is, equally subject to the operation of its rules, apart from their size, power, or importance. By it the obligations of a powerful state to a weak state are the same, under the law, as those between states equal in power. From these three primary and permanent rights all the specific rights of states are derived,—the right of making war and peace, of negotiation, of legislative and judicial control of foreigners within the territory, and, in fact, all the rights conceded to sovereign states by the law.

Though states are not moral persons, in the strict sense that all the principles of ethics apply to them in the same way as to individuals, yet there are certain duties or moral claims, as they have been well called, which lie at the basis of the system governing their relations. Of these, four well-defined classes may be mentioned as receiving general acceptance. These are the duties of humanity, of good faith, of comity or international civility, and of respecting the unquestioned rights of another state, and repairing injuries. Other obligations, more or less vague in character and extent, have been referred to by different political moralists; but it is eminently unsafe to reason in international law from individual views of international morality; and the four obligations mentioned are all that can reasonably be assumed as universally binding.

States are sometimes joined with other states in a formal union, by which each parts more or less with its sovereignty. These unions vary in character, and may be divided into three general classes, viz.: Unions under a reigning prince, federal unions, and protective unions. In the first class are: (1) Personal union, which exists when two states have a reigning prince in common, but are otherwise entirely independent. An example of this is the union of Holland and Luxemburg, the king of Holland being also grand duke of Luxemburg, but each state retaining its individuality and full powers of sovereignty. (2) Real union, where internal sovereignty is reserved to the members, but external sovereignty is given up to the union as a whole. The states of the Austro-Hungarian monarchy are an example. (3) Incorporate union, where both internal and external sovereignty reside in the body politic as a whole. The union of Great Britain and Ireland is an example. Federal unions are of two kinds, a federal state, such as the United States of America, where external sovereignty resides in the union, and a confederation of states, where it is reserved to the members, as in the German Confederation of 1815. Protective unions exist in great variety, but they are all based on the surrender of some part of the power of independent action in foreign affairs to the protecting state. The dependencies are generally known as semi-sovereign states.

3. *Diplomatic and other agents.*—Diplomatic agents are of four classes: ambassadors, ministers plenipotentiary, ministers resident, and chargés d'affaires. The United States are represented by agents only of the last three classes. In order that these agents may be perfectly free and unrestricted in the performance of their duties they are granted a general immunity from the legal jurisdiction of the government to which they are accredited. The immunity extends to their family and suite, and, within limits that have never been clearly defined, to their residence. The immunity consists in exemption from arrest, from civil or criminal process, and from being required to attend as a witness in court. The property of the minister is also exempt from all proceedings *in rem*. As to the immunity of the official residence, the better opinion is that no judicial process can be served therein, though some governments—the British, for example—claim the right to enter and make arrests, after giving notice. The only general exception to diplomatic immunity is where the acts of a minister endanger the safety of the state, as by inciting to insurrection, and where the emergency admits of no delay. Here the paramount right of self-preservation justifies a disregard of the diplomatic privilege. But in all cases but those requiring instant action the government to which the minister is accredited must proceed by demanding his recall.

Consuls.—Consuls are commercial agents, having, in general, no diplomatic functions or diplomatic immunities. A state is not bound to allow the residence of foreign consuls, though, at present, the practice is universal among civilized states. Consuls cannot enter upon their duties until they have received an exequatur, or permission to act, from the local government. If guilty of offenses against the law, they may be tried in the courts of the country where they reside, or they may have their exequatur withdrawn, and be sent back to their own country. The duties of consuls of the United States consist in receiving the protests of masters and seamen; in administering the estates of Americans dying abroad intestate; securing the effects of stranded vessels; sending home destitute seamen, etc. In the East and in the Mohammedan countries of the Mediterranean they have judicial functions, which are defined in the treaties between the United States and those states, and they are granted immunity from the operation of the local law, similar to that accorded to diplomatic agents.

Naval commanders.—The commanders of ships of war, at sea and on foreign stations, are in a sense agents of the government, and as such must come directly under the operation of international law. While on shore in foreign countries they have no immunity from local jurisdiction, unless clothed with the diplomatic character, by virtue of special instructions. Among their duties as agents of the government are, in time of war, the examination of the merchant vessels of all countries, and the capture of those found violating the laws of war; in time of peace, the police of the ocean, which requires them to apprehend pirates, and the protection of American interests wherever such protection demands their interference. It must be remembered, however, that a forcible demonstration of any kind is a hostile act, which, if unwarranted, violates the sovereignty of the state against which it is directed, and interrupts, as far as the act is concerned, the peaceful relations of the government. The injured state is likely to demand reparation, and if a blunder has been committed by a naval commander, the government will be compelled to sacrifice him, even though he may have supposed that he was acting in the discharge of his duty. If such acts are performed at the request of a consul, the officer's individual responsibility will not thereby be taken away. Though it is the duty of a naval commander to render every reasonable assistance to a consul, yet the consul cannot give him orders, nor can the officer throw the responsibility for his acts upon the consul. He must, therefore, be sure that he keeps within the bounds imposed by international law.

4. *Nationality.*—(a) *Persons.* As international law is concerned (1) with states, and (2) with the agents of states, it also affects (3) individuals, as the members of a state, whenever they come into relations with any other government than their own. It is, therefore, of great importance to determine exactly the tests by which membership of a state, or nationality, as it is called, is known. A person who has always resided in the country of his birth, and whose parents were natives of the country, clearly belongs to that country. But if he removes to another country, or if he engages in a business which is partially conducted in foreign territory, he enters upon new relations. While residing abroad, he may retain his allegiance to his native country, or he may transfer it. In the first case he obtains a new domicile, in the second, a new citizenship; in other words, he becomes naturalized. A man's domicile is the place in which he resides with the intention of remaining. If a man goes to a country, *sine animo revertendi*, or with only the general intention of returning

after many years, he acquires a domicile there. If he has been there only a short time, the presumption is that he has not acquired a domicile; but this presumption may be removed by proof of intention to remain. If he goes to a country only temporarily, with the intention of returning shortly, he does not acquire domicile. If he has a house of trade in a foreign country, though retaining his original residence, he is considered as domiciled there, so far as the trade of his foreign house is concerned. Short absences do not destroy domicile; but, in the case of a long absence, the presumption is that the domicile is changed, especially if the person has returned to his native country. A man simply domiciled in a foreign country retains his original allegiance. If he wishes to change this, he must go through the process of naturalization. The laws governing naturalization differ in different countries, but they agree in requiring a certain period of residence, a formal renunciation of former allegiance, and a formal adoption of the new allegiance. Naturalized citizens are regarded in the same light as natives by international law, except that on their return to their native country they may be made accountable for any obligations to the state which they had incurred, but had not fulfilled, before the change of allegiance.

(b) *Ships.* Ships, as well as persons, must have a distinct nationality, and certain rights and duties result from it. The conditions upon which nationality is acquired are determined by each state in its municipal law. Laws determining the national character of ships are known as navigation laws. They vary in detail in different countries, but they agree in looking to three main facts: (1) place of construction of the ship, (2) ownership, and (3) nationality of officers and crew. In regard to (1), most of the states of Europe and America admit foreign-built vessels to their registry. The exceptions are the United States, Brazil, Portugal, Greece, Mexico, and Colombia, which require that a vessel should be native-built. As to (2), in most countries merchant ships, in order to obtain a register, must be wholly owned by subjects. In Belgium and Holland, however, three-eighths of a ship may be owned by foreigners; in France and Greece, one-half, while in Italy, Sweden, and Chili ships may be owned by domiciled residents. As to (3), nationality of officers and crew, England, Belgium, Norway, Germany, Holland, Chili, and Uruguay make no limitation; Austria and Mexico require that the captain and two-thirds of the crew shall be subjects; Brazil and Portugal, the captain and three-fourths of the crew; Peru, the captain and one-fifth of the crew; Denmark, all the officers and crew; Sweden, only the captain; Russia, one-fourth of the crew; the United States, Spain, and Italy, the officers and two-thirds of the crew; France and Greece, the officers and three-fourths of the crew. Evidence of the nationality of a vessel is to be found in her flag and papers. The flag alone is not conclusive evidence, and in time of war the question can never be decided without reference to the papers. Ships' papers relate to the nationality of the vessel, the course of the voyage, and the cargo. The most important are: 1. Register or certificate of nationality, sometimes replaced or accompanied by 2. Passport, issued by the sovereign authority, or 3. Sea-letter, issued by local authorities where the ship was fitted out. 4. Charter-party, or contract by which the vessel is let to hire. 5. Log-book, or daily record of the voyage. 6. Bill of sale (when the ship has been sold). 7. Bills of lading, or duplicate receipts of cargo from master to shipper. 8. Invoices, detailed statements of separate lots of goods. 9. Manifest, a general statement of the cargo. 10. Clearance, a permission to sail, given by local authorities of port from which the vessel sets out. 11. Muster-roll, statement of crew. 12. Shipping articles, agreement for the hiring of seamen. 13. Bill of health.

5. *Rights of navigation.*—The high seas are open to the free navigation of ships of all nations. No state can exercise sovereignty or jurisdiction thereon, except on board of its own vessels, public or private. These the municipal law follows, as long as they are at sea; and offenses committed on board of them at sea are cognizable only by the courts of the country to which the ship belongs. No visit, search, or detention of merchant vessels by men-of-war can be exercised, except in time of war, when the usage of nations makes an exception in favor of the belligerent right of search. Another exception is in the case of vessels suspected of piracy; but, in general, no act of sovereignty can be exercised by the agents of any state on the high seas, except on board of its own vessels.

The territorial waters of a state include the open sea to a distance of 3 miles from the coast, and all rivers, lakes, inland seas, harbors, and roadsteads, and bays included between neighboring headlands. Within these limits foreign vessels must conform to the local laws and regulations. They may even be refused an entrance, if the government exercising sovereignty sees fit to close its ports to foreign commerce. States within whose borders lie rivers or straits, by which alone access from without can be obtained to another state, cannot deny to the other state the right to use these means of access. They may, however, subject vessels passing through their waters to reasonable tolls and regulations.

6. *Local jurisdiction over foreign ships in territorial waters.*—A distinction must here be drawn between public and private ships. Public ships are those employed in the service of the state, commanded by naval officers, acting under a commission from the government. The ship may not be owned by the government, it may carry no guns, it may have a cargo on board; but it will still be a public ship if it answers the conditions named. Public ships carry no papers, in the sense in which merchantmen carry them; but if the flag and pennant do not sufficiently establish their nationality and their public character, the captain's commission and orders are always conclusive. In foreign ports public ships have peculiar immunities. The state to which the port belongs has no authority on board, can exercise no police functions, and can serve no judicial process. Offenses committed on board the ship, by which the local laws are violated, are not cognizable by the local courts. But if an offense is committed on shipboard by an inhabitant of the place, and the commander of the ship sees fit—as he always would—to deliver him up to the local authorities, they can try the offense. But they could not arrest the offender on board the foreign ship of war. To private or

merchant vessels no such immunity is granted. They have no exemption from the jurisdiction of the state in which they are, except by express convention. Police-officers may go on board of such vessels, their officers or seamen may be arrested on board, writs may be served, and crimes occurring on board, by whomsoever committed, are triable in the local courts. The law of France differs from the general practice in this, that it allows much greater privileges to foreign merchantmen than that of other states. According to the French rule, acts relating to the interior discipline of the ship, and crimes to which the crew alone are parties, whereby the peace of the port is not disturbed, are left entirely to the authorities of the ship; but crimes committed on board the ship by subjects of the state where the vessel lies, or against subjects, or any offenses by which the peace of the port is disturbed, or in relation to which the assistance of the authorities is invoked, are tried in the local courts. This rule is confined to France alone, and must be considered as a waiver on the part of the French government of rights conceded by the law of nations. In all cases of offenses committed on shore by the officers or crews of foreign vessels, public or private, the offender may be arrested on shore, and tried and punished by the local courts. But if the offender belongs to a ship of war, and escapes to his ship, the law cannot follow him there, nor can it compel the commander of the ship to surrender him.

7. *Refugees and deserters.*—(a) *From the shore to the ship.* The captains of ships of war and the masters of merchantmen have the right to refuse asylum to fugitives; and they ought always to refuse it to persons under accusation or sentence of crimes, generally known as such. Persons charged with light offenses, or with offenses that are only crimes by the local law (as in Mohammedan countries), or with political offenses, may be received; but all these cases call for the exercise of great judgment. In a civil war or revolution, care must be taken to give no assistance to either party; as, by the transportation of an insurgent chief from point to point. In ships of war especially, the commander must do nothing that will compromise his government. The general rule is that the captain may receive such persons, or may refuse to receive them, or, after receiving them, may put them off, being guided always, first, by the paramount necessities of the service, and, secondly, by such humane consideration as the fugitive may deserve. Fellow-subjects demanding an asylum should always be received, unless there are grave reasons for refusal. The rights of the local government are in accordance with the rules governing local jurisdiction, already given. Neither search nor arrest can be made on board a public vessel; but in merchant ships the local courts have full powers, and the master may even be prosecuted for harboring fugitives.

(b) *From the ship to the shore.* If the fugitives are prisoners of war escaping from a belligerent cruiser, they become free immediately upon landing in neutral territory, and no claim for their recovery or surrender will be entertained. Fugitives belonging to the ship, or deserters, may be reclaimed of the local authorities. The universal usage is for the consul to furnish information, or if there is no consul, the captain or master of the ship, and the authorities thereupon give such assistance as they see fit. There is great difference in the ease with which deserters are recovered in different countries and in the assistance that the local government and police are willing to render. The policy of the United States has generally been to insert a clause in consular treaties by which consuls of both contracting parties are authorized to arrest deserters from ships of war and merchant vessels of their country, and to require the aid of the local authorities. There are 22 such conventions between the United States and foreign powers, but Great Britain is not included in the list.

8. *Piracy.*—Piracy is robbery or murder on the high seas, done *animo furandi*, and in a spirit of general hostility. Pirates are considered as having no nationality, and the crime is one against the whole human race. They may be seized by any one, and tried in the courts of any state. It is the duty of naval commanders to apprehend them wherever they may be, or against whomsoever the crime has been committed; provided always, that the sovereignty of another state is not violated by hostile acts committed therein. Vessels suspected of a piratical character may even be searched in time of peace by the cruisers of any state; but if the vessels so searched should be found to be innocent, the government whose cruiser makes the search will be responsible to the state to which the searched vessel belongs. Search should therefore only be made upon strong suspicion. Acts have sometimes been made piracy by the municipal law of a particular state which are not piracy by international law. These cases are purely national in their character, and concern only subjects of the state making the law. Persons guilty of acts which are made piracy by municipal law can only be seized by cruisers of their own state, and can only be tried in their own courts.

Laws of War.

9. *Hostile measures falling short of actual war.*—It often happens that a state or its agents may find it necessary to redress injuries or repel aggressions that are hardly considerable enough to be a *casus belli.* In these cases the right of self-preservation justifies the use of such measures as may secure the safety of the state without going to war. Every effort must first have been made to obtain redress by peaceful means; but if this is refused, or if the emergency is such as to leave no time for appeal to higher authorities, resort must be had to force. In the first case, forcible measures can only be ordered by the sovereign authority; in the second, action must be taken by the agent of the government on the spot. Hostile acts on the part of the sovereign authority may take the form of embargo, retorsion, or reprisals. *A civil embargo* is laid by the state upon its ports in the form of a prohibition to merchant vessels of one or more foreign states from entering the ports. *A hostile embargo* is a detention of foreign merchant vessels. If a hostile embargo develops into a war, the vessels detained may be regarded as prize. *Retorsion* is simply retaliation, and consists in redressing an injury by the infliction of a like injury. *Reprisals* consist in the seizure of property belonging to the offending state or to its subjects. It was effectively used by the

United States against France in 1798. To these three forms of hostility may be added pacific blockade, which has been attempted several times, but which is open to many objections and has never received general support, and the performance of treaty guarantees, under which we have occasionally landed forces at Panama. The last is of an anomalous character, and only arises in the cases provided by treaty.

Forcible measures are taken by the commander of a military or naval force on the spot only when the emergency admits of no delay. Such cases frequently arise in barbarous or semi-civilized countries when outrages have been committed against citizens of the state to which the force belongs, and in revolutionary countries when the lives and property of foreigners are in danger. Cases may even arise in civilized countries where an immediate application of force is necessary. The latter are the most delicate cases that can arise in the conduct of international relations. They are so various and unforeseen in character as to admit of no general rules, and they must be determined by the special circumstances of each case as it arises. A commander must fulfill the duty of protecting the citizens of the state on the one hand, and the obligation to respect the rights of a foreign and friendly state on the other. Further than this it is impossible to prescribe rules, and merely to mention the cases that have occurred would exceed the limits of this article.

10. *War and its prosecution.*—The question whether a war is just or unjust is one which hardly enters into international law, though it is generally discussed in treatises on the subject. A nation has received injuries that cannot be redressed, or to which redress is refused, and declares war against the offender. The injured state is alone the judge of the extent and gravity of its wrongs, and it goes to war because war is the only remedy left to it. There is nothing to prevent it from going to war on a frivolous pretext, or for purely aggressive reasons; third parties will not interfere by force unless their own safety is threatened. Modern practice varies in regard to declarations of war; but it is always desirable that a formal declaration should be made, in order that both subjects and neutrals may be sufficiently apprised of the new state of affairs. If hostilities break out gradually, a subsequent declaration legalizes all hostile acts that have preceded it. The outbreak of war puts a stop to all trade and other intercourse between subjects of opposing belligerents. Contracts made with an enemy before the war are postponed; those made during war are void. Partnerships entered into before the war are dissolved. A government may make exceptions to the general stoppage of trade, but licenses are only respected by agents of the government granting them. The grant of a license is a high act of sovereignty, and can only be made by the supreme authority in a state. The license of an admiral, commander-in-chief on a station, binds only those under his orders. The possession of an enemy's license is enough to condemn a ship. At the beginning of a war, enemies in the country are generally given a reasonable time to withdraw with their effects. The general rule with regard to enemies' private property during war is that it is liable to capture at sea, but not on land. The distinction is based on the fact that one of the speediest and most humane methods of bringing an enemy to terms is by crippling his commerce; while capture of property on land serves no such purpose, and is attended with the greatest hardship to individuals. Property is not wholly exempt from capture, even on land; an invading army is always justified in obtaining supplies, on requisition, either with or without payment, and, in general, in living upon the enemy. But there is no such general right of confiscation as at sea. The laws of war have been improved considerably in recent years, and they are better defined than formerly. The Geneva conventions of 1864 and 1868, for securing immunity to the medical service and the wounded, the Brussels conference of 1874, and the St. Petersburg treaty of 1868, prohibiting the use of explosive bullets for small-arms, are steps in this direction, though the second of these failed to come to an understanding. As to persons, the general rule is that non-combatants shall be unmolested; but severe penalties are inflicted upon those who take up arms against an invading force without being distinctly soldiers, and belonging to an authorized organization. This would include guerrillas and partisan bands whose officers held no commission from the government, and who bore no distinguishing badge or uniform. An exception is made, however, in the case of a *levée en masse.* The practice of private war on the ocean, or privateering, seems to be falling into disuse. Privateers are private persons to whom a commission, called a letter of marque, is issued by the government, allowing them to cruise for the purpose of destroying an enemy's commerce. They are placed under heavy bonds to observe the laws of war and to send in their prizes; but the practice is open to many objections, as it is difficult to maintain the necessary supervision and restraint over their movements. The Congress of Paris in 1856 abolished privateering as between the contracting powers; and though the United States, and some smaller powers, have not acceded to it, yet the Declaration has gone far to discourage the practice. War should be carried on as humanely as possible consistently with the end in view, which is to break the power of the enemy. The bombardment and destruction of unprotected cities is contrary to civilized practice; but a city defended by forts may be bombarded, as a means of reducing the forts. Good faith is to be kept even with enemies, but ruses and stratagems of war are permitted. False colors may be carried to deceive an enemy; a ship may even chase, though she may never fire, under false colors. Surrender is indicated by hauling down the flag, or by a white flag, which puts a stop to fighting at once; but a vessel that undertakes to escape, or to renew the fight, after the cessation of hostilities caused by hauling down the flag, may be severely dealt with. When a seaport surrenders to the army or navy it may be occupied, and regulations established for its government during the occupation; and the commander-in-chief of the forces of occupation may prescribe a tariff for foreign vessels and goods, and levy duties accordingly.

11. *Search, detention, and capture.*—The right of search is the right to stop and examine merchant vessels in time of war to ascertain their

nationality and character, and the nature of their cargo and of their voyage. It can only be exercised by ships of war, and only upon merchant vessels. It may be exercised anywhere except within the territorial waters of a neutral state. The usual mode of conducting a search is by sending a junior officer on board the vessel to be searched, who inspects the ship's papers, interrogates the master, officers, and crew, and, if necessary, examines in detail the cargo and all parts of the ship. The ship of war is not to use force, unless the merchantman willfully evades or resists search. If, upon examination, the vessel is clearly neutral property, and if she is engaged in innocent trade, she is allowed to proceed on her voyage; otherwise she will be detained. The circumstances, any one of which will justify detention, are as follows: that the ship is enemy's property; that she has undergone a fictitious and fraudulent transfer from an enemy owner; that her papers are false, missing, or mutilated; that she is herself contraband, or is carrying contraband goods, persons, or dispatches; breach of blockade; sailing under enemy's convoy; sailing under enemy's license, and trading with the enemy, if the vessel belongs to a subject or to an ally; enemy's prize; recaptured or rescued prize. It is not necessary that the guilt of the vessel should be absolutely proved. If circumstances show a reasonable ground of suspicion, the captain of the cruiser is justified in detaining her. But if the vessel be detained without a reasonable ground of suspicion, the captor will be liable in costs and damages. If the circumstances warrant capture, the captor will put an officer as prize-master and a crew on board the vessel, who will take her to the most convenient port where a prize-court may be sitting for adjudication, with all her papers and cargo intact. Resistance to search will subject the vessel to capture and subsequent condemnation, though she may be innocent of any other offense. Vessels sailing under neutral convoy are not on that account exempt from search, and the resistance of the convoying ship to the search of any vessel under her escort will subject both the convoying and the convoyed ships to capture. All prizes must be sent in for adjudication, unless special circumstances, such as the want of men for a prize-crew, or the unseaworthiness of the prize, make it impossible. In this case, if the prize is clearly enemy's property, she will be destroyed, otherwise she must be released. If the prize is destroyed, her papers, and any part of her cargo that may be saved, must be sent to a prize-court. If, for any reason, the prize cannot be sent to a port of the captor, it may be sent to a neutral port, if the neutral authorities make no objection; and the cargo, if perishable, may be sold there after the proper survey; but the ship's papers, the most important witnesses, and the proceeds of all sales must be sent to a prize-court in charge of an officer, with a full statement and explanation of all proceedings in relation to the prize. The papers, proceeds, and witnesses will be delivered to the officers of the court, as well as the prize itself, if brought to the place where the court is sitting.

12. *Prize-courts.*—The court to which the prize is sent must be a prize-court of the captor, and it can only sit in the territory of the captor or of his ally. The prize-master, upon his arrival, should immediately cause proceedings for adjudication to be instituted by the proper officer. In the United States the district courts have cognizance of all cases of prize, and proceedings are instituted by the U. S. district attorney. The hearing of the case is rather in the nature of an inquiry by the government, rather than of litigation *inter partes.* The witnesses belonging to the prize are examined privately upon certain standing interrogatories. Upon this testimony, together with the evidence of the ship's papers, the decision of the court is based. The examination is called the examination *in præparatorio,*—*i.e.*, preparatory to judgment by the court. In ordinary cases, no further examination is held, and no testimony is taken in behalf of the captors. If, however, the preparatory examination leaves the case in doubt, the court may order further proof, in which any evidence may be received bearing upon the case. If the prize is condemned, the court orders a sale, and makes the distribution of the proceeds under the statute. If the prize is not enemy's property, and if no illegal act has been committed, the prize is restored to the claimants, if they have proved their title to the property. Damages may be awarded against the captor in case of detention without probable cause.

13. *Enemy's property and neutral property.*—Until the year 1856 it had been a general principle of prize law that ownership determined the national character of ship's cargoes, irrespective of the flag under which the ship might be. Enemy's property in a neutral vessel was liable to capture, but neutral property in an enemy's vessel was not. The Declaration of Paris reaffirmed the second of these rules, but reversed the first. By the new rule free ships made free goods; the neutral flag covered the enemy's cargo, and exempted it from seizure. Although the Declaration has not been universally adopted, the United States among other nations having refused to accede to it, it is not improbable that the rule, "free ships make free goods," may become general. As the law stands, however, apart from express conventions, vessels laden with enemy's property will be seized and sent in. They are not condemned, and they receive freight for the whole voyage, but no damages for detention. The enemy's cargo is confiscated. The other rule simply restores the neutral cargo taken out of an enemy's ship. Freight is paid to the captor if the goods are taken to their port of destination, otherwise not. The character of the property, that is, the question whether it is neutral or hostile, is determined by the domicile of the owner, independently of his nationality; property is neutral whose owner is domiciled in a neutral country, and property is hostile whose owner is domiciled in the enemy's country. But these rules are interpreted somewhat in the interest of captors. Thus, if a person has a neutral domicile, but a house of trade in the enemy's country, property connected with this house is deemed hostile; but if he has an enemy domicile, all his property is deemed hostile, wherever his house of trade may be. Ships sailing under the enemy's flag, wherever owned, have always a hostile character; and ships that have been transferred from an enemy owner to a neutral, after the war has begun, are regarded with peculiar suspicion. In determining questions of

domicile, territory in the military occupation of the enemy is regarded as hostile territory; and the produce of the soil of hostile territory is always regarded as enemy's property, no matter who may be the owner.

14. *Contraband.*—Contraband goods are goods useful for military operations and destined to the service of a belligerent. Two things are therefore necessary to constitute contraband,—1, warlike use; 2, hostile destination. The list of articles held to be contraband, when destined for the enemy's country, is not definitely settled. Goods may be divided into three classes, according to their employment,—(1) those useful primarily and chiefly in war, (2) those useful only for purposes unconnected with war, and (3) those useful alike in peace and in war, or sometimes in one and sometimes in the other. The first are always contraband, the second never; while the character of the third must be determined by circumstances. In the first class may be mentioned arms, ammunition, and projectiles, their appurtenances, and the materials and machinery for their manufacture; explosives; military equipments and clothing; military and naval stores, including spars, hemp, cordage, marine-engines, anchors, iron plates, and bars. In the third class are telegraphic materials, railway materials, coal, horses, money, and provisions. The last class are contraband when there is a presumption that they are intended for warlike use; as, when they are going to a fleet or to a port of military or naval outfit, or when the character of the war is such as to create a special demand for them. The immediate destination of the ship is not always held to be conclusive as to the destination of the contraband goods. The vessel may be bound for a neutral port; but if it can be shown that this is only a screen, and that the goods are ultimately destined for the enemy, she may be captured and condemned. The penalty in cases of contraband is the confiscation of the contraband goods, and of all other parts of the cargo belonging to the owner of the contraband goods. The ship is not confiscated unless she belongs to the owner of the contraband goods, or unless she sails with false papers; but in any case, no freight for the contraband goods, or damages for detention, are allowed to the ship. Liability begins when the ship carrying contraband has started, with an immediate or ulterior destination for an enemy's port. Liability ceases with the delivery of the contraband cargo; and the ship cannot be captured on her return voyage, unless she is shown to have made the outward voyage with simulated papers. A ship is contraband when she is fitted for war and destined for the enemy. If a contraband ship is captured she will be condemned, together with all contraband goods in her cargo, and all innocent goods belonging to the owner of the ship or of the contraband cargo.

15. *Carrying contraband persons and dispatches.*—Contraband persons are persons in the military or naval service of the enemy, and civil officers of the enemy sent out on public duty and at the public expense. Contraband dispatches are official dispatches of the enemy not in the ordinary mails and not diplomatic in character. Ships engaged in carrying such persons or dispatches are liable to seizure and condemnation, together with all their cargoes that belong to the owner of the vessel. The ships are looked upon as being for the time in the enemy's service. To establish their offense it is not necessary that they should be bound for an enemy's port, nor is it considered a justification that they are acting under constraint. Diplomatic persons and papers are not considered contraband. In all cases, vessels captured must be sent in for adjudication, and the obnoxious persons and dispatches must be sent in with them. Neither persons nor papers can be taken out of a neutral ship without capturing and sending in the prize.

16. *Blockade.*—Blockade is the stationing of a naval force near a port, river-mouth, or coast of the enemy, and the capture of all merchant vessels, neutral or otherwise, that attempt entrance or egress past the blockading force. Blockades, to be binding, must be effective; that is, maintained continuously by a force sufficient to make the passage dangerous. Paper blockades, or blockades established by proclamation, without stationing an adequate force near the blockaded port, are illegal. In order to justify the detention of a vessel attempting to enter or leave a blockaded port, it is necessary that the vessel should have had notice of the existence of the blockade. This notice may be actual or constructive. Actual notice is notice by the blockading squadron on its station. It is usually put in the form of a statement indorsed on the register of the merchant vessel by the boarding officer. Constructive notice is notice which may be presumed to have been given either by a proclamation or diplomatic circular of the blockading government, or by the notoriety of the fact. At the beginning of a blockade, a reasonable time may be allowed for the proclamation to become generally known; and during this time actual notice must be given. After the period has elapsed, it is no longer necessary, and the fact of notice may be constructively assumed. The only exception is in the blockade of remote places, ordered by the commander-in-chief on the spot, where diplomatic notice cannot be given; in this case, known as blockade *de facto*, actual notice or warning must be conceded during the whole period of the blockade, and neutral vessels may sail with a contingent destination to the blockaded port. But they are not allowed to anchor, or remain in the neighborhood of the entrance. The presence of the blockading squadron is considered sufficient notice to vessels lying in the blockaded port; but it is customary to allow neutral vessels a short time to leave the blockaded port in ballast, or with cargoes previously laden; but this privilege must have been expressly granted. The penalty for breach of blockade is confiscation of the ship and cargo. An unsuccessful attempt is regarded by the courts in the same light as a successful attempt, if the intention is proved. In attempts to break blockade inwards, where general notification has been given, liability begins when the vessel, whose destination is the blockaded port, has started on her voyage, knowing the port to be blockaded. In breach of the blockade outwards, liability continues till the end of the voyage, unless in the mean time the blockade has been raised; in which case the liability ceases. A blockade ceases when the blockading force voluntarily withdraws, or when it is driven off by a force of the enemy. In these cases, a new

blockade requires a new notification. But if the blockading squadron is only temporarily dispersed by stress of weather, and immediately resumes its station, the blockade is not held to have ceased. In strict law, neutral men-of-war have not the right to enter a blockaded port; but in practice, the privilege is usually conceded by the blockading squadron.

17. *Recapture and rescue.*—Recapture is the taking of a vessel which, at some previous time, had been captured by the enemy. Rescue is the recovery of a prize by the original crew, and is effected by overcoming the prize crew. Vessels which have been made prize by the enemy may be recaptured by cruisers of the other belligerent; but neutral ships of war cannot recapture prizes made by a belligerent, even though the prize was originally owned by subjects of the neutral state to which the cruiser belongs. A recaptured prize reverts to the original owner, if it has not yet been condemned in the enemy's prize-court, and salvage is awarded to the recaptor. The rule by which the prize returns to its original owner is called the right of postliminy. It can only take place before condemnation. If the prize has been condemned, the proceeds are distributed according to the provisions of the prize act, without regard to the previous owner's claims. If an enemy's vessel has been made prize, and is recaptured by the enemy, and again subsequently recaptured from the enemy, the proceeds go to the last captors. A rescued prize, on recapture from the rescuers, is always condemned, though it may not have been subject to condemnation before it was rescued. The mere act of rescue is considered as a resistance to the exercise of belligerent rights, like resistance to search, and it subjects all the property rescued to the extreme penalty.

18. *Rights and duties of neutrals.*—When a war breaks out between two states, other states may decide for themselves whether the occasion justifies or requires their joining in the war, or whether they will remain neutral. This is a question of policy, mixed with ethics, but it is in no sense a question of law. The policy of neutrality being once decided on, certain consequences flow from it. The belligerent must respect neutral rights, and the neutral must fulfill neutral obligations. Among the first rights of neutrals is that of having their territory free from the operations of the war. No hostile act can be performed within the borders of a neutral state, or within its territorial waters. Within these limits belligerent cruisers may not attack or capture vessels. The only exception is when a fight has been begun outside of neutral territory, and the enemy, during the fight, takes refuge within the limit. It is then said that the pressure of instant, overwhelming necessity may justify her capture. A belligerent may not, within neutral territory, increase his armament or military stores, recruit men, or employ force or stratagem to rescue prisoners or recover prizes from the enemy; nor may he make a neutral port the base of hostile operations. In case of the violation of neutral territory, the belligerent is bound to make reparation for his unlawful acts. Land forces may not march through neutral territory, but the rule is not so strict with regard to cruisers; and though a neutral may allow or forbid, as he chooses, the entry of belligerent cruisers into his ports, there is no restriction in regard to their passage within the three-mile limit along the open coast. On the other hand, neutrals have certain obligations towards the belligerents. Neutral governments are forbidden to send supplies of men, ships, arms, or money to either belligerent. It is their duty to prevent the forming of armed expeditions, and the building, equipment, or armament of ships of war for belligerent use; to exercise diligence in the detection and suppression of such attempts, and, if necessary, to pass laws for their prevention; but they are not responsible for supplies of arms, or other contraband, made by private citizens in the way of trade, nor for loans to belligerent governments made by private parties. It is their duty to prevent hostile acts between belligerents within their territory. They are responsible to the state which suffers by such acts, and they are called upon to demand reparation from the aggressor. If troops of either belligerent enter neutral territory the neutral must intern them,—*i.e.*, disarm them, and put them under either surveillance or parole. A neutral government regulates the entry into its ports of belligerent cruisers and their prizes, and the supply of coal to steamers, as seems best to it, but with the general limitation that all privileges granted to one party must be granted to the other.

19. *Treaties of peace.*—A treaty of peace is binding from the date of its ratification, but a prospective date is sometimes fixed for the treaty to take effect in distant parts of the world. Captures made after this date are unlawful, and must be restored; as is also true of captures made before the date, with knowledge that peace had been concluded. Other captures made previously to the treaty are retained, the treaty being understood to be upon the basis of present possession, unless otherwise stated.—*J. Russell Soley, Professor U.S.N.*

Interpolation. The finding a value of an element which falls between two given values. This process is called into constant requisition in navigation. The different elements tabulated in the Nautical Almanac are given for particular times at Greenwich, and to find their value at any instant between any two of these, a proportion must be worked. In most cases an approximation is sufficient, which may be found either by applying roughly a fractional part of their difference to one of them, or more accurately by the use of tables given in works on navigation. When extreme precision, however, is required, it must be remembered that these elements do not change uniformly, and a correction has to be applied which is called the *equation of second differences.*

Inundations. In ancient Egypt officers estimated the case of sufferers from the inundations of the Nile. The changes of property in Bengal by alluvion are equally attended to. *Inundation* is also a method of impeding the approach of an enemy, by damming up the course of a brook or river, so as to intercept the water and set the neighborhood afloat. In Egypt the plan was diametrically opposite, for by flooding Lake Mareotis the English gunboats were enabled greatly to annoy the French garrison at Alexandria.

Invalid (*Eng.*). A maimed or sick soldier or

sailor. To *invalid* is to cause to retire from active service from inability.

Inver. A Gaelic name, still retained in Scotland, for the mouth of a river.

Inverted-cylinder Steam-engine. One having its cylinder inverted over the shaft with direct action downward to the crank; much used in the mercantile marine on account of its economy of space, but objectionable for naval purposes, as the cylinders being high are exposed to the enemy's fire. Called also *inverted engine.*

Invincible Armada. See ARMADA, INVINCIBLE.

Invoice. An account from a merchant to his factor, containing the particulars and prices of each parcel of goods in the cargo, with the amount of the freight, duties, and other charges thereon.

Inward Charges. Pilotage and other expenses incurred in entering any port.

Ipswich. A town of England, capital of Suffolk County, on the Orwell. Although the Orwell is only navigable to the town for vessels of 500 tons burden, the town contains docks at which some of the largest vessels have been built, and at one time Ipswich-built vessels were considered equal to those built in any other part of the globe.

Iridium. A metal discovered by Dr. Wollaston, associated with the ore of platinum. It is gray, brittle, very infusible, and its specific gravity is about 13.6. It forms several oxides and chlorides, and combines readily with carbon. It takes its name from the Latin *iris*, the rainbow, in consequence of the variety of colors exhibited by its solutions.

Iris Ears. A name applied to the shells of the Haliotis,—a univalve mollusk found clinging like limpets to rocks.

Irish Horse. Old salt beef.

Irish Pennants. Rope-yarns hanging about the rigging; loose reef-points or gaskets flying about; fag-ends of ropes.

Iron and Steel. *Nomenclature.*—The ordinary classification of iron products has been pig-iron, steel, and wrought iron. Karsten established the logical, scientific basis of this nomenclature. But within about 15 years methods have been developed which produce large homogeneous masses of iron or steel at a single operation. Thirty years ago homogeneous masses of steel or iron were limited in size to a few hundred pounds at most, and the iron and steel of commerce was, with the exception of crucible tool-steel, produced in a pasty state as the immediate product.

The *homogeneity* of the new products was so striking as to suggest a classification based solely on the fact of the *product having been actually melted*, calling these products *steel.* This was highly illogical; for on the one hand usual homogeneous cast-iron castings would properly be called steel, and on the other, Mushet and others in France and England had long ago melted pure wrought or bar iron, which should also be called steel. This system has justly fallen still-born among metallurgists. Since 1876 the classification proposed by the International Committee of the American Institute of Mining Engineers has been recognized as the best nomenclature for all practical purposes. It has been universally accepted in Europe, and forms the basis of the official records of the German empire. It is therefore adopted in this article on account of its general use, as well as its intrinsic value.

All products of iron ores group themselves naturally in this nomenclature, except "native iron," *i.e.*, meteoric iron, which we may regard as a cosmical curiosity.

IRON.

I. Forgeable; difficult to melt.		II. Not forgeable; easy to melt.
A. Produced in a fluid state.	B. Produced in a non-fluid state.	C. Pig-iron.
1. *Ingot-iron* not hardening.	3. *Weld-iron* not hardening.	5. White pig-iron without graphite.
2. *Ingot-steel* hardening.	4. *Weld-steel* hardening.	6. Gray pig-iron with graphite.

Or in the order in which the products appear in manufacture:

1. Pig-iron.
2. Weld-iron (Schweisseisen, Fer soudé, Wälljern).
3. Weld-steel (Schweissstahl, Acier soudé, Wällstål).
4. Ingot-iron (Flusseisen, Fer fondu, Götjern).
5. Ingot-steel (Flussstahl, Acier fondu, Götstål).

The term *weld-iron* designates all varieties of wrought iron in which merchantable iron has been produced by welding up blooms from a pasty mass, or by welding together bars previously rolled from a puddled ball, or otherwise. It includes all kinds of iron not melted and poured. These latter are properly grouped in the term *ingot-iron*, the different kinds of which have been melted in a furnace or pot and poured into ingots. These are the "homogeneous iron" (Howell, 1856) with very little carbon melted in crucibles, and the same metal melted in the Siemens "open-hearth" furnace, or Bessemer converter. The weld-iron from its mode of manufacture and the presence of cinder among its particles retains a distinctively *fibrous* character, while the ingot-iron being free from cinder remains distinctively *granular* in all ordinary products.

It is an interesting fact that every known process of making *iron* will also make *steel.* Therefore we need the term *weld-steel* to designate steel made in Catalan and finery forges, and the direct reduction processes in blooms, from the puddling-furnace in balls rolled to bars, and from the cementing-furnace in bars. The products of the forge are commercially known as "German steel," of the cementing-furnace, as "blister steel" in bars, as they leave the furnace, or as "shear steel," when welded and drawn down for cutlery. The products of this class are all used as the raw material for cast steel, as steel containing a high percentage of carbon is called.

All steels which have been melted in any manner and poured into ingots are termed *ingot-steel.* Ingots of pot steel for tool and cutlery purposes are usually limited to the capacity of a single pot, in the Bessemer and Martin processes to 10 or 15 tons; but by methodical arrangements ingots over 45 tons in weight can be made at Essen by

Krupp, and at Creusot by Schneider, and extremely heavy ingots at Bochum, at the Russian Imperial Works, and at Firth's and Vickers' works in Sheffield.

The essential element of commercial iron is carbon. So extremely intimate is the connection that in practice iron without carbon is unknown, and so great is the influence of carbon that a very slight change in its percentage vastly changes the properties of the metal.

The total amount of carbon iron in any form is able to take up seems to be about 6 per cent. The least that exists in the purest merchant iron is about 0.06 per cent. Iron or steel capable of being *wrought* never contains more than 2.3 per cent. carbon, cast iron, fusible, and unworkable, beginning at that point. Nothing above 2.3 possesses market value as steel, and the only article that possesses any special value at this point is the *Wildstahl*, a product of Styrian forges, used for its extreme hardness as draw plates for wire.

In the other direction, the separation of steel from iron is quite as distinctly marked at and below 0.20 per cent. carbon; Karsten placed the line at 0.25 per cent. carbon, at which the metal would not harden even in *mercury*, while recent European authorities, like Akerman and Wedding, define 0.4 per cent. carbon as the point of division at which the difference in hardness before and after hardening begins to be noticeable.

Commercial steel is not, of course, a compound of iron and carbon alone, but contains usually, in addition, small quantities of silicon, sulphur, phosphorus, manganese, and copper, and also chromium, titanium, and tungsten. These elements, so commonly present, reduce the percentage of carbon required to impart sufficient hardness to give sparks with a flint to about 0.5 per cent.; in steel very free from these elements 0.65 per cent. would be required for the same effect. In the best Swedish and Styrian makes 0.35 per cent. carbon produces sufficient hardness to cause the iron to be denominated "steely."

These statements are based on the use of a heat at hardening proportioned to the content of carbon in the steel. But when the carbon falls below 0.15 per cent., the highest heat and the use of mercury as the most energetic cooling medium fail to produce any perceptible increase of the hardness.

When the percentage of carbon falls below 0.15, every effort to *harden* the metal results in *toughening* it and making it more *ductile*. When a square bar of ingot-iron is broken cold after nicking, the fracture is abrupt and the grain coarsely crystalline, while the other end of the same piece, nicked in the same way and broken after "*hardening*," will break with great difficulty, being distorted by the force required, and will present a silky, substantially fibrous fracture. Siemens-Martin boiler-plate is tested by means of this fact. Any ingot-iron plate is rejected which, after being heated to bright red and plunged into water, cracks when bent back 180° on itself. But the ductility developed is so striking that a common quality will stand much severer bending tests after this treatment than before it. All the splendidly bent specimens of open-hearth boiler-plate makers are thus toughened, and the boiler plates used at Crewe by the London and Northwestern Railway are toughened or annealed bodily before use. The *toughness* produced may be measured by the ratio of the elastic limit to the breaking weight before and after "hardening." In 30 specimens of Bessemer iron-plate from three Swedish works, given by Akerman, this ratio was reduced from 0.502 in the unhardened to 0.398 in the hardened, and in 4 specimens of Siemens-Martin iron-plate, from 0.418 in the unhardened to 0.389 in the hardened. Bessemer iron, ult. ten. 58,884 and 91,739 pounds resp.; limit elasticity, 29,584 and 36,553 pounds resp. Siemens-Martin iron, ult. ten. 54,759 and 77,232 pounds resp.; and limit elasticity 22,899 and 30,011 pounds resp. In the case of phosphoriferous weld-irons this effect is very striking, and the tenacity, elongation, and contraction of area of fracture may be increased by hardening. Poor open-hearth boiler-plate with 0.15 phosphorus will stand much severer bending tests after hardening than before. The writer proposed in 1875 this great development of toughness and ductility as an independent method of distinguishing steel from ingot-iron, and corroborated as it has since been by many facts and experiments, it may be used with advantage.

Ingot-iron is chosen for comparison as exhibiting this property best, but it is as well shown in kind, though not in degree, by weld-irons. In proportion as the weld-iron is denser or freer from cinder, "hardening" has a greater effect upon it, and the great increase of strength and toughness in pretty dense iron has been so long known that even Sefström refers to it, as Akerman states. The property has of late been turned to account for cannon, with the use of oil instead of water.

Metallurgical Chemistry.—The most important compounds are the oxides of iron. In its treatment for the production of refined metal, iron is not directly acted upon by air or oxygen, except in the Bessemer and refinery processes. In all others it is indirectly affected by oxygen absorbed in the cinder associated with the iron. Of this cinder protoxide of iron forms the base, the acid silica, and also alumina, being supplied by the ores, the iron, and the brick of the furnaces. The protoxide possesses a great affinity for oxygen, and will part with it freely and reabsorb it so long as the proper temperature is maintained. This fact and the affinity of iron for carbon form the basis of iron metallurgy.

The oxides of iron are noted with an atomic weight of 56 for iron, the old nomenclature with 28 atomic weight being inclosed in brackets.

Protoxide, $Fe''O''(FeO)$,	77.77 p. c. iron.
Magnetic oxide, $Fe''(Fe_2)^{vi}O''_4(Fe_3O_4)$,	72.41 " "
Sesquioxide, $(Fe_2)^{vi}O''_3(Fe_2O_3)$,	70.00 " "
Hydrated sesquioxide, $\left.\begin{matrix}(Fe_2)^{vi}\\ H_6\end{matrix}\right\} O''_6(2Fe_2O_3,3HO)$,	59.92 " "

The protoxide never occurs free in manufacture, possesses a strong affinity for oxygen and the power of decomposing water. The magnetic oxide occurs free as an ore, containing, when pure, 31.04 per cent. protoxide and 68.96 per cent. sesquioxide. The sesquioxide forms, with water, a true chemical combination, the basis of all brown hematite iron ores.

When metallic iron is heated the air oxidizes it rapidly, forming hammer-scale richer in oxygen than the protoxide, and sometimes reaching the sesquioxide itself. Moisture, especially when associated with carbonic acid or ammonia, oxi-

dizes iron rapidly, which can be counteracted by a coating of zinc, or the presence of lime or alkalies. Iron burns freely at a very high temperature in air, but can scarcely be volatilized by the highest attainable temperature.

The affinity of iron for *carbon* is most characteristic. Within a range of 0.06 to 6.0 per cent. we see almost entirely different metals with properties varying in extraordinary ways. This affinity enables the blast-furnace to be successfully worked.

In speaking of "*iron*," it must be noted that a *combination of carbon and iron is always meant*, pure iron being unknown in practice. The *alloys* of iron are unimportant, except that with *zinc*, which is commercially applied in *galvanizing*, with a coat of metallic zinc. The combination of iron and carbon with tin enables plates to be covered in a similar way with a coat of metallic tin. Iron and carbon also combine easily with chromium and aluminium, and with difficulty with titanium and tungsten.

The combination of carbon with iron is both chemical and mechanical; the latter when the carbon separates in flakes as *graphite* in pig-iron, in which, in those varieties containing most carbon, it may be separated as graphite by slow cooling, and be recombined by quick cooling, *i.e.*, chilling.

In true steel the combination is purely chemical, though free graphite is often, if not usually, present. The effect of hardening is to cause the carbon to entirely combine with the iron in steel, and the experiments of Caron have shown that hammering has the same effect.

The other elements most intimately associated with iron (and carbon) are *sulphur*, *phosphorus*, *silicon*, *manganese*, and *copper*.

Sulphur has great affinity for iron at a low red heat, and is almost universally associated in the form of pyrites with the ores, and by reduction with the iron. It tends to prevent the formation of graphite in pig-iron; to reduce the total percentage of carbon; also, to make pig-iron melt with difficulty and run pastily and shrink strongly, so as to unfit it for castings when present over 0.6 per cent. The influence of sulphur on wrought iron makes it rotten at a red heat (red shortness), and injures its weldability materially; its effect on steel is similar. A percentage of 0.01 is quite perceptible, of 0.05 quite injurious, and 0.1 makes both bar-iron and steel nearly useless. It must be removed in the blast-furnace.

Phosphorus is as intimately associated with iron as sulphur. It increases the fusibility of pig-iron, and up to say 0.5 per cent. improves it for castings, but more reduces the strength. It assists the separation of graphite. It is often present up to 1.0 in good pig-iron, and 5 or 6 per cent. in iron used for Berlin castings. In wrought iron phosphorus causes the iron to weld and work easily when hot, thus antagonizing sulphur (but not *neutralizing* it, in a strict sense), but makes cold iron hard and brittle (cold shortness). A weld-iron low in carbon may contain 0.3 per cent. without injury, and when harder 0.2 without injury, the latter amount also being possible in passable ingot-iron with 0.10 per cent. carbon or less. Steel, however, of any kind is injured materially by phosphorus; one can note the presence of even 0.01 per cent. distinctly, and no reliable steel can contain more than 0.10 if soft, or 0.04 per cent. if harder. Phosphorus is freely removed in puddling and reheating, by its sweating out with the cinder; it cannot be removed in the blast-furnace.

Silicon is found in all kinds of iron, and its effects are similar to those of phosphorus, but graver. It makes wrought iron rotten at a red heat, 0.05 per cent. injures iron or steel seriously, and 0.4 makes both entirely useless in presence of other deleterious elements. If, however, steel is quite free from phosphorus and sulphur, as are crucible steels, it will bear from 0.15 to 0.25. The presence of this amount of silicon is *characteristic*, as other steels—as Bessemer, etc.—usually contain less than 0.1. The presence of silicon enables steel to be poured free from blow-holes. But for metallurgical purposes silicon is an essential element of pig-iron, as its burning during refining forms necessary cinder and generates great heat. White pig-iron contains seldom more than 1.0 per cent., gray usually 2.0, often as much as 5.0 (Scotch), and for Bessemer purposes 3.0 is generally liked.

Manganese is a common and most beneficial element. In pig-iron it is present up to 40.0 per cent. from the blast-furnace when specially made; often up to 10.0 or 12.0 per cent. from manganiferous ores. It may be combined with iron and carbon up to 90.0 per cent. manganese (ferro-manganese) for the Bessemer and Siemens-Martin processes, a white soft leadlike substance extremely oxidizable. In pig-iron it makes the metal white, and causes the chemical combination of the carbon up to the greatest possible content, nearly 6.0 per cent. This form of iron is called Spiegel iron (mirror iron), from its broad, brilliant crystals. Manganese develops great heat in burning, forms an easily fusible cinder, and materially aids in removing the ordinary impurities from iron in refining, while in the blast-furnace it increases the fluidity of the slag. It is seldom present in iron to any great extent, but is usual and beneficial to steel up to 0.3 per cent., or even 1.0 per cent. in special cases. It antagonizes red shortness. Being extremely oxidizable it takes the function of carbon, when the latter is purposely kept low, in removing oxides from the metal and enables a milder steel to be made. So long, however, as carbon is present in any considerable quantity the manganese remains but slightly acted on and goes into the metal. Manganese, if present in decided quantity, say over 0.4 per cent., is apt to make steel fly to pieces or crack in hardening; 0.25 per cent. will have this effect if phosphorus be present over 0.02 per cent. More than 1.0 per cent. makes low steel brittle when cold.

Copper is a very common impurity of iron, more seldom of steel, as it is where possible excluded from the latter by the choice of material. It acts similarly to sulphur, and about as strongly. A percentage of 0.5 is highly injurious.

A statement of the relative *hardening* power of these elements on steel very approximately exhibits relations of importance. If one unit of phosphorus, say 0.01 per cent., will produce a certain amount of hardness or brittleness, 2–3 units silicon, 5 units carbon, and 7–8 units manganese will produce the same effect. It would be truer to say that carbon increases strength and the other elements brittleness, for the best

steel is that which contains least phosphorus, sulphur, and silicon.

Ores of Iron.—1. Magnetic iron ore. This consists mainly of the magnetic oxide of iron, and can, of course, never contain more than 72.41 per cent. metallic iron. It often contains a sesquioxide, and rarely carbonate of iron. Quartz, chlorite, or hornblende are its principal gangue, and magnetic pyrites, iron pyrites, copper pyrites, and apatite its principal impurities. The amount of impurity varies of course, but the ore ranges from 40 to 60 per cent. iron. In the Lake Superior region the No. 1 ore is guaranteed 60 per cent.

It occurs principally in primary massive or schistose rocks, exceptionally in the Devonian (Siegen district) or Lias (Rosendale, England).

It is in general a red, short ore, tending to produce a hard, not very gray iron, on account of its comparatively difficult fusibility.

2. Franklinite, a combination of iron, zinc, manganese, and oxygen with 45 per cent. iron and 20 per cent. zinc may be regarded as an ore of iron. Its principal use is for spiegel iron, rich in manganese, after the extraction of the zinc for zinc paints. It occurs only in New Jersey, near Franklin.

3. Red hematite, or Specular ore. The ore occurs crystalline in plates or crystals (rhombohedric), as specular ore in Elba and Lake Superior. In spherical aggregations with fibrous texture in the west of England associated with the ore in a sandy form more or less hard. Also massive, as red hematite in England, Spain, Lake Superior, and Algeria. Also in oolitic beds with lenticular formation, as in Northern New York.

The ore in whatever form leaves a characteristic red streak when rubbed on rough porcelain. Its principal gangues are calc spar in Spain, quartz in Lake Superior. Generally clay and often pyrites and apatite occur with it, the latter in inconsiderable amount. The average contents of iron is 30 to 40 per cent., though the Spanish and Algerian ore is generally over 50 per cent., and Lake Superior over 50, with enough of greater purity to form a grade of 60 per cent. guaranteed.

It is found in all rocks, from the oldest to those of the coal formations. It occurs abundantly in all parts of the world, and makes as a rule the best iron. The Spanish swords owe their fame from immemorial time to the splendid deposits near Bilbao, which are now used in all countries for pig-iron for steel.

Massive red hematite makes in the blast-furnace a neutral iron of great purity, which is now almost exclusively devoted to the manufacture of steel of all kinds.

4. Brown hematite is a widely-distributed ore in all formations. It consists of the hydrated sesquioxide of iron, and is often associated with other ores as the result of their decomposition. The brown hematite in the soil of the valleys along the edges of the Silurian formation in the United States seems largely derived from the oxidation of the iron pyrites in the older slates.

The ore occurs in every form with a principal gangue or admixture of clay, also quartz in the massive forms, and in general calc spar and dolomite. A very frequent accompaniment is manganese ore. The Bog-iron ores come under this variety, and are now in process of formation in ponds or bogs along our eastern coast and in Sweden. Sand is, of course, a large impurity, and the bog ores are almost valueless from their cold shortness.

The value of the ore varies greatly, and that which occurs massive is generally the most valuable and most used. Although seldom injuriously red short, the ore occurring in the older formations are generally red short, while that of the new formations is cold short often to a very great extent.

In the purest varieties the percentage of iron may sometimes, but rarely, be as high as 60 per cent., but will probably not average more than 30 per cent., often falling lower. Much of this ore cannot be worked at all on account of small percentage of iron.

5. Spathic iron ore. This ore is a carbonate of the protoxide of iron, and cannot contain more than 48.2 per cent. iron. It also contains carbonate of protoxide of manganese in the crystalline varieties, having often as much as 11 per cent. manganese oxide. What goes under this title is usually more or less crystalline. It usually contains little or no hurtful impurity.

The percentage averages between 30 and 40, but may always be increased by roasting, often to more than 50 per cent. It makes iron of the greatest purity and value for all purposes, especially steel. Its greatest development occurs in the Siegen district of Westphalia, where 500 veins, of 6 to 20 feet thickness, are worked, and in Styria and Carinthia, in Austria, where enormous deposit exists; over 150 feet of ore at Eisenerz. Krupp and the Austrian Royal Works depend largely on this ore.

A variety of this ore, however, occurs massive in the Lias formation near Cleveland, 15 to 22 feet thick, which has given rise to the most considerable iron district in England, since its discovery by Bolkow in 1847. Its percentage of iron averages about 34, always enriched to more than 40 by roasting, and it is quite cold sheet.

6. Clay ironstone, or argillaceous iron ore. This consists of the carbonate of iron in admixture with clay, and sometimes sand, and more or less water. The carbonate is found generally intimately mixed with clay in nodular masses with conchoidal fracture, which are distinctively argillaceous iron ore, often in this country called *carbonate ore.* Often, in England, these nodules disappear, and the ore and clay form a continuous stratum called *clay band.* The percentage of iron varies between 25 and 35, but may be enriched by roasting. This ore is found in this country, principally in the lower coal-measures of Pennsylvania and Ohio. In England nearly two-thirds of the iron product is derived from this ore in its different varieties.

Black-band Ore.—When the argillaceous iron ore is found in connection with coal veins it carries a considerable quantity of coal, makes a black streak on porcelain, and is called black band, the term given by the Scottish miners. Its principal occurrence and first discovery (Mushet, 1801) are in Scotland, near Glasgow, where it yearly produces in a small district about 900,000 tons of pig-iron.

It carries 10 to 25 per cent. of coal, which enables the ore to roast itself, burning with a good deal of vigor. Its content of iron varies much, and will average 25 to 30.

In the United States this ore is of very little value, occurring seldom, and very sandy.

I. Is the best grade of Crown Point, Lake Champlain *magnetic ore.* It often contains much more phosphorus, and sometimes as much as 16 per cent. titanic acid.

II. *Second class* Lake Superior *red hematite,* McCracken mine. The first-class ore contains over 60 per cent. iron, and less than 8 per cent. quartz or silica.

III. *Fossil red hematite* from Clinton, Northern New York, representing the oolitic varieties of the ore.

IV. *Brown hematite* from Chestnut Hill, Pa., representing the best ores of the Siluro-Cambrian formation. They are frequently far more cold short, and seldom richer in iron.

V. *Carbonate ore* from Pittsburgh Coal Horizon, in Fayette County, Pa. These ores are usually more cold short.

VI. *Black band* from Llanelly, Wales, characteristic "Mushet stone," contains from 3.3 to 8.0 per cent. coaly matter in the vein proper. The sulphur exists as pyrites.

METHODS OF IRON PRODUCTION.—Only two methods are open to iron-workers. Either the ores are reduced at a low temperature directly to steel, and after reduction, if iron be desired, the carbon burnt out sufficiently by exposing the "loup" to the blast, or the ores are powerfully reduced with an excess of carbon, and the resulting iron forced to take up carbon with formation of pig-iron. The older methods using the Catalan and associated forges, all proceeded in the first way, and make to this day both steel and iron wherever the richest ores occur with plenty of charcoal, as in the Adirondacks and Germany. But it was long ago apparent that the best product was got by first making pig-iron, and then oxidizing it to burn out the carbon and other elements by various refining processes. This change took place about 1546, as described by Agricola. We shall consider the reduction process first, as its logical place in the operations of the present day.

The Blast-furnace.—The general idea of a blast-furnace may be put as that of a tall cylindrical shaft of considerable capacity, whose internal shape is in general the result of placing a cone on the base of another cone inverted. Three or more cones may often be traced, or the section may be formed by a segment of a circle sweeping from top to bottom. The shapes are not the result of fancy; the process itself dictates some details, the kind of pig-iron sought and the fuel used the rest.

Where the bases of the two cones meet the greatest area for a given height is found, and this is called the boshes. As the inverted cone narrows downward it takes the name of *crucible,* and that of *hearth* in its smallest dimensions at the bottom. In this country only hearth and boshes are usually distinguished. The top of the upper cone is called the *throat,* and its opening the *tunnel-head* of the furnace. The *tuyeres* pierce the walls of the crucible at a height (30 to 70 inches) sufficient to contain all the iron that can be melted in 8 hours, along with a covering of 10 to 18 inches of slag, for the pig-iron must not, when formed, be exposed to the action of the blast.

The object of the shape is to supply the materials regularly as they are melted in the hearth, and at the same time in a condition open enough to be acted on and reduced by the ascending gases. The object of the boshes is both to hold such a supply as will cover all irregularities in melting, and to reduce the temperature quickly to such a degree that the ore cannot be melted into cinder before its entire reduction and the carbonization of the iron. The carbonization takes place in the zone of greatest heat, a frustum of the cone above the tuyeres not more than 2 feet high. The coal, limestone, and iron-sponge preserve their shape even at this point, which they reach so hot as to melt away like wax. A *tapping-hole* is provided at the lowest point for the iron, and a *cinder-notch* just below the tuyeres lets the slag out at proper intervals.

The exterior of the furnace is now as nearly cylindrical as may be for convenience of bracing, either by an entire iron shell inside of which the furnace is built, or by flat bars tightened round the brick-work after its erection. In both methods the lower part of the furnace is supported on columns to afford free access all round to the hearth and tuyeres.

The size of furnaces varies greatly, owing to the great difference in ores and fuel. The smallest are *charcoal* furnaces, ranging from 452 to about 2000 cubic feet internal contents. The *anthracite* furnaces of Pennsylvania and Wales vary from 2000 to 6000 cubic feet. *Coke* furnaces vary from about 3000 to 42,000 cubic feet. *Raw coal* furnaces in Scotland average 7000 cubic feet and a product of 180 tons a week.

The *product* of charcoal furnaces varies from 7½ to 30 tons a day, according to size and ore. In the other classes 20 to 40 cubic feet produce a ton of iron per week with good management. In the largest furnaces with poor ores 50 cubic feet per ton per week are often required in Cleveland, and on the other hand, with the richest ores, high heat, and an ample blast, about 11 feet of cubic contents produce a ton per week at the Edgar Thomson Works near Pittsburgh; where 1300 tons are made in a furnace of 20 feet bosh.

Blast-furnace accessories.—The heart of the whole process is the blowing-engine, which as now made is usually a short-stroke engine, about 4 feet stroke, making 30 to 70 revolutions per minute, and with a blast-cylinder 60 to 84 inches diameter, according to volume of blast desired. The steam-cylinder varies in diameter according to pressure desired, for a 72-inch cylinder 32 to 38 inches. The fly-wheels vary with the engines from 9 to 16 tons to preserve uniformity of motion. It is useless to cut off steam less

than ⅝ stroke or more than ⅝ as engines are ordinarily situated, counting the vicissitudes of steam-supply and the necessity of blast of uniform pressure. An engine taking steam more than ⅝ stroke would take more than its share of the available heat. Long-stroke engines have been considered more durable, and in this country, with 84-inch blast-cylinders and 7-foot stroke, they have a very good record.

The blast, if used cold, would have very little power except in small charcoal furnaces with easily reducible ores, and it has been used hot since Condie invented the water-cooled tuyere in 1830. The waste gases had been in 1814 used for steam by Aubertot, and they were immediately applied to heating the blast, thus rendering the blast-furnace a complete organism independent of any source of heat except the coal charged with the ore.

Hot-blast stoves were at first cast-iron pipes of every imaginable form, the object being to expose the greatest amount of heating surface in the stove where the gas was burnt. The Scotch U pipe, where the cold-air pipe ran along one side of the stove carrying a number of U or siphon-pipes connected with the hot-blast pipe on the other, has been superseded by a form of stoves in which several bed-pipes run across the stove carrying close-legged U pipes, often 14 feet high and 9 inches in diameter, the bed-pipe being intercepted by diaphragms, which force the blast up and down through 5 double legs, or about 140 feet, before reaching the hot-blast side or connection. In order to avoid unequal heating and burning the pipes the waste gas is now burnt in a special chamber below and connecting with that containing the pipes, and called the *combustion-chamber*.

Cast-iron stoves rarely, if ever, have more than 3 square feet of heating surface to the cubic foot of blast. The majority probably not more than 1½ square feet. The limit of constant heat producible with safety to the pipes is 900°, or thereabout, and the friction of the blast in passing through them is considerable. As far as possible the area of the pipes should be increased in accordance with the formula $1 + 0.003t$; t being temperature to which blast is heated. At the Moselem Furnace, in Pennsylvania, where cold-blast anthracite iron used sometimes to be made for short periods, the engine made 38 revolutions with 3 pounds pressure, but when the blast was turned through the stove for ordinary iron only 28 revolutions could be made at a pressure of 5 pounds per square inch.

Of late years, however, the regenerative fire-brick stoves, incapable of injury, and with a vast heating surface, have been found preferable, where the expense can be met. They afford about 8 square feet of heating surface to the 1½ of a cast-iron stove, and blast may be delivered at 1500° unvaryingly. They are used in sets of 3 or of 4, with one to spare, the gas being burnt in two while the third is heating blast. They are of the Whitwell and Cowper types, both covered by the Siemens principle.

The other accessories are steam-boilers fitted to be fired with the waste gas from the furnace; pumps to supply the tuyeres, etc., with water, 1500 to 2500 gallons per hour being used by a furnace with bosh 14 feet in diameter.

The *hoists*, by means of which the *charges* are raised to the tunnel-head, are of almost every possible construction, some with a water counterbalance, others with steam hoisting-engines, with air-cylinders working by vacuum or by pressure, with steam direct, and water-pressure direct and indirect.

Materials.—Ore, fuel, air, and flux are the materials of the process.

The ores are generally prepared, except in the case of open red hematites, by crushing to convenient size, and roasting before they are charged. They are sometimes washed with water to remove sulphates formed in roasting, and in Bohemia, with weak sulphurous acid, to remove phosphate of lime. Uniformity and moderately small size improves the working of the furnace. An average of 2½ tons of ore to the ton of iron is thought a good one in the United States, and about 1⅝ tons is the best attainable. It does not pay to work ores which will not make a ton of iron with less than 3¾ tons.

The *fuel* may be either raw bituminous block-coal, as in Scotland, Ohio, and Indiana; coke, as universally used; anthracite, in Eastern Pennsylvania and Wales; or charcoal, as in Sweden, Germany, Russia, and United States. Coke well made, from coal washed to remove pyrites and ash, is probably the kindest and best fuel, enabling the quickest work. Anthracite is more refractory, requiring a higher temperature and blast-pressure. Charcoal burns so easily that it will not support either a high temperature or much blast. With coke, 1 ton to the ton of iron is the best practice; with anthracite, about 1¼ tons, usually 1½ tons; with raw coal, 2 tons (Scotland) to 3½ tons (U. S.); and with charcoal, 110 bushels, or about 1980 pounds per ton, with hot blast, and 205 bushels, or 3690 pounds, with cold blast.

Air is required to furnish oxygen. By volume air contains about 21 per cent. oxygen, and by weight 23 per cent. By weight, averaged the year round, the percentage of water is not less than 0.2, as furnaces must be situated in valleys where they can get water. Water vapor is deleterious, as returning less heat than it takes to decompose it, and furnaces which make gray iron in winter often cannot keep up heat enough, from this cause, to do so in the spring when the air is saturated. Under ordinary conditions about 6 tons of air are required per ton of iron, and more can be profitably used.

The *flux* is usually limestone, as free from magnesia as possible, and must be charged in such proportions as to maintain a slag *acid*, with silica for charcoal furnaces, and *basic* with lime for coal and coke furnaces. On an average 1½ tons to the ton of iron is required, much depending, however, on the original composition and mixture of the ores.

About 6 tons of solid material is estimated as the average required for a ton of iron.

Process.—This is mainly a powerful reduction in the upper part of the furnace by means of carbonic oxide at a comparatively low temperature, and a carbonization in the zone of greatest heat. Before the tuyeres carbonic acid is formed, which, as it ascends, is soon reduced to carbonic oxide by the glowing coal in the charges. Other metals are reduced, of course, beside iron, and the hotter the furnace the more silicon and the less sulphur are present. In manganiferous

ores, the greater the heat the more manganese is reduced, and the less graphite is present. Substantially all the phosphorus in the ore and coal goes into the iron.

The shape of the hearth and boshes depends on the iron desired. For forge-iron a capacious hearth is used, quickly widening upward, that the heat filling a large space may be less intense; this is especially the case where *spiegel* or full white iron is made. But for gray iron the hearth is comparatively contracted, and every means taken to increase the temperature. In using the Cowper and Whitwell hot-blast stoves, with enormous reserve of heat, it is found that one is comparatively independent of form of hearth or of moisture, and production can be driven to the utmost extent. We are beginning to find that it is advisable to use a great amount of blast, both for regularity of working and quality of iron.

Products.—Gas, slag, and pig-iron. The *gas* consists of nitrogen, with carbonic oxide and acid, some cyanides, and the fumes of any volatilizable oxides there may be, such as zinc oxide. The carbonic oxide, although only about 20 to 28 per cent. by volume, produces more than sufficient heat for steam and heating blast, with some available for roasting ores.

The gases furnish the means of regulating the operations of a blast-furnace and calculating its economy. Bell found that with Cleveland ores the gases should contain about 737 pounds carbon to the gross ton of iron produced and escape at about 600°. In this country, Mr. J. M. Hartman finds that with a healthy furnace the gases should not escape higher than 275°, and are often as low as 180°. Mr. Hartman has suggested a most useful "carbon duty" formula, based on the fact of the furnace having a constant requirement of 2179.19 calories for the heat carried off by conduction, and in the gas, cinder, and iron, and throwing the duty on one ton of carbon. Thus, the duty performed may be ascertained by the weight ratio of the carbonic acid to the carbonic oxide in the gas. Thus, in a year's work of a coke furnace this ratio amounted to 0.99 of the carbonic oxide, and the constant requirements to 23 per cent. of the entire heat produced. The furnace is doing good work in proportion as its constant requirement falls below 23 per cent. and as the ratio of carbonic acid to oxide approaches 1 to 1.

The *slag* makes considerable labor to dispose of it, as rarely less than 1½ tons and often 4 tons or more are made per ton of iron; the poorer the ores the more slag. It is capable of application for bricks, for cement, and for mineral wool.

Pig-iron is not by any means pure iron; charcoal iron containing not less than 3.5 per cent., and that made with mineral fuels rarely less than 6.5, and sometimes 10.0 per cent. of other elements. In spiegel iron 17 to 27 per cent. is of other elements, of which 9 to 22 is manganese. This is an important feature in refining.

According to the state of the carbon and the varying grain and color, iron is graded often into 8 grades, but in U. S. usually into 5.

1. No. 1 Foundry. Dark gray, large crystals, graphitic, soft.
2. No. 2 Foundry. Lighter gray, small crystals, less free graphite, and less open texture.
3. No. 3 Foundry, or gray forge. Quite light gray, little free graphite apparent, and close texture, crystals hardly showing.
4. Mottled iron. A mixture of gray iron with white iron, hard. An intermediate grade is often inserted as a No. 4, in which the white iron is less than about ¼th, mottled being then called *full mottle*.
5. White iron. Full white, crystals more or less large, brittle.

Nearly white iron from Gleiwitz, brown hematite and coke. Finkener. IV. Characteristic German spiegel iron. Tookey. V. Franklinite spiegel iron, New Jersey ores. McCreath. VI. Bessemer pig No. 1, Crane Iron Co., Lehigh Valley, from magnetic ores and anthracite. McCreath. VII. Bessemer pig, manganiferous; Zwickau, quoted by Petzholdt. VIII. Average composition of 13 first-class U. S. guns (regulations of 1841), by Morfit. The per cent. iron is too high, probably containing phosphorus, owing to method of analysis. IX. Average composition, *hot-blast* charcoal iron, in U. S. guns, for elements quoted, Morfit. X. Average composition, *cold-blast* charcoal pig, in U. S. guns. Morfit. XI. Belgian ordnance cast iron, analyzed by Abel.

The *melting-points* of white iron may be taken at 1900° to 2000°, and that of gray iron at 2000° to 2100°. Gray iron becomes fluid at once, while white goes through a pasty state on melting.

The *specific gravity* of dark-gray iron is 6.635 to 7.275; of medium gray, 6.916 to 7.572; and of white iron, 7.056 to 7.889.

The specific gravity, tenacity, and hardness of

Greenwood charcoal pig-iron were determined by Wade, as follows:

Pigs.	Sp. Gravity.	Tenacity.	Hardness.
No. 1	7.004	14,486	8.48
No. 2	7.153	27,153	13.86
No. 3	7.245	34,424	21.40

The highest tenacity, 40,897, of Greenwood iron was associated with a specific gravity of 7.272, the strength decreasing from that point as the density increased. Each pig or mixture of iron has a similar definite point of highest tenacity, the range of density for ordnance lying between 7.20 and 7.35 as extremes.

In castings of this high grade charcoal iron for guns, the appearance of the fracture shows the quality. In smaller castings, a somewhat close grain of regular gray fracture, with a jagged uneven surface, taking hold of the finger like a rasp, indicate a metal of the highest tenacity. If the grain be uneven in color and texture, and the surface comparatively smooth, the tenacity is lower. In large masses the grain will be quite coarse and fracture more jagged, and the color very light gray, with darker spots rather sparsely intermixed.

WELD-IRON—WELD-STEEL.—As iron and steel are habitually made by the same methods, in the same apparatus, they must logically be associated in any description of processes involved.

Either may be made by reducing directly from the ore, that is, burning its oxygen out with carbon, or by burning out the carbon of pig-iron by means of the oxygen of the air. In either method the action may be carried further than necessary to produce steel, and the carbon be introduced again by cementation with charcoal. As a curiosity, steel can be made from pig-iron bars heated in sand with slight access of air (Tunner's steel).

The first of these methods is usually called the *direct*, the second the *indirect*, *method* of producing iron.

The direct methods include the following:

1. *Catalan forges.*
2. *The iron-sponge processes.*

The indirect methods are,—

1. *The finery forge.*
2. *Puddling.*
    a. *Puddling proper, including refining.*
    b. *Boiling.*
    c. *Rotary puddling.*
3. *Cementation.*

The *Catalan forge* is the oldest known method, having been practiced in some form from the remotest antiquity. It is synonymous with the old English *bloomery*, although the method was abandoned in England nearly 150 years ago.

The Catalan forge, as improved in Catalonia, a province of Spain, is a low small hearth, in which a single tuyere is used, blown by a bellows, or a *trompe* or water-jet blast apparatus, at a pressure of about ¼ to ½ pound per square inch (power utilized, 10 per cent.). The fire of charcoal is built in the small nearly square hearth, mainly in two different ways. In the old Catalan the charcoal is at the back, over the tuyere, and the ore is laid in, and afterwards fed, at the front. The bottom is of charcoal. In working, the ore partially reduces, partially goes into a cinder, which covers the iron as it forms. The loup is kept in the hottest place before the tuyere, and the first cinder is tapped off as impure, and afterward let off every hour. The forgeman works the ore into the fire with his bar, opening up the fire also, and when enough ore has been supplied clears away the charcoal, presses the loup together, and lifts it out to the hammer. The loup weighs about 350 pounds, and the process lasts 6 hours. The loup is cut at first into 3 pieces, which are reheated over the fire at the next heat and drawn down. About 1000 pounds of ore are used each time, and 100 pounds of iron require about 300 pounds ore and 340 pounds of charcoal. In the *Genoese* forge the ore is roasted beforehand by the waste heat, and scrap-iron is used along with the ore. The yield is thus increased to 5 heats a day, and the consumption of charcoal diminished about a third. The weekly product is about 4 tons.

The *German Catalan forge* is worked differently. On a bed of charcoal waste ore is first melted, and then the rest of the charge of ore is laid on in layers alternating with the charcoal. The heat lasted 6 hours, and the loups weighed about 75 pounds. To 100 pounds iron about 800 pounds ore and 438 pounds of charcoal were used.

These German bloomeries have been developed in the United States on rich magnetic ores with very good results. Their greatest number is now in the Adirondacks, where they have the characteristic feature of using a *hot blast* heated by traversing pipes placed in the flame of the fire, which is sometimes also used for steam for blowing-engine, with slight additional fuel. In the Adirondacks the hearths average about 22 × 30 inches (660 square inches), by 13 inches deep, with walls at the sides, open at the front, and the D-shaped tuyere at the back. The ore thrown on the fire is reduced, some of it being converted to slag as it works down through the fire. At frequent intervals the cinder is tapped out, and every 3 hours the loup is dug up, weighing about 300 pounds. A fire makes about 2400 to 3000 pounds per day. The loups are forged into *slabs* for boiler-plate, or *billets* for cast steel. One gross ton of blooms requires 1½ tons dressed ore (or about 3 tons raw ore), and 2 tons, or 250 bushels of charcoal, with warm blast, against $2\frac{4}{10}$ tons, or 300 bushels, with cold blast.

The Damascus or wootz steel, and the "Wolf" of iron or steel, were made in a high forge, which may be called by its Swedish name of *Osmund furnace* or *forge*. It gave rise to the blast-furnace, increasing in size and product as the means of blowing it were invented. The small East Indian forges were of clay, built in a bank or wooden frame, about 3 to 6 feet high and 18 inches square. They produced 10 to 180 pounds per charge or heat, which was often allowed to cool in the forge. The German *Wolf furnace* produced "wolves" of about 500 pounds of iron in 8 hours with about 2189 pounds charcoal.

The *iron-sponge processes* represent a vast deal of fruitless labor. Of all tried only the *Siemens* and the *Wilson* methods are in use in each case, so far as we know, by the inventors only. *Chenot* (1831) endeavored to reduce ore by charcoal or carbonic oxide in vertical chambers externally heated. The resulting mass was powdered and the sponge separated by a magnet, and used for cast steel by melting in crucibles. *Clay* (1837) reduced ore with charcoal in clay retorts open-

ing into a puddling-furnace, where the sponge was worked out. *Renton* (1851) substantially the same, except attempting to weld the sponge into blooms, and *Harvey* the same, with the substitution of inclined soapstone trays. *Smith* (1855) attempted to reduce ore direct in the puddling-furnace, using petroleum vapor to carbonize the sponge; *Gurlt* (1857) used Chenot's apparatus in a similar way, letting the sponge fall with its impurities upon a furnace hearth, where it was melted. *Whelpley & Storer* applied the same method, blowing a mixture of powdered ore and coal upon the hearth of a puddling-furnace. Rogers (1862) used Clay's methods, but substituted a *rotating* retort. *Dupuy* (1874) proposes a mixture of ore and charcoal in a box of sheet-iron to hinder oxidation. *Wilson* applies the inclined tray or surface, reducing the ore on it and using the resulting sponge in a bloomery forge. *Siemens* (1870) combined Clay's and Roger's plans, melting the sponge in a bath of pig-iron in a rotary furnace. This is still in operation at Landore, and is not strictly a direct process. *Blair* (1872) improved Chenot's plans; cooled the sponge before contact with air, compressed it cold to a bloom, which was either worked in the heating furnace or melted into soft steel. The objections to the sponge processes proper are great waste of iron and of fuel, the difficulty of welding the sponge, and the intermittent character of the work.

The *indirect methods* all demand pig-iron as their raw material.

The oldest one is the *finery forge.* It produced till 1784 all the iron, and till 1839 the most of the steel used, and was worked on almost numberless methods, dictated by the circumstances or caprice of the operators. It made iron or steel with equal facility, a change of the force and direction of blast and the quantity of cinder allowed to cover the ball constituting the only changes; for steel the ball is protected as much as possible, and for iron exposed to oxidation as much as is safe. The process is slow as compared with its successors,—5 tons per week being a good yield. This quantity would be puddled in 1½ days, or made into Bessemer steel in 20 minutes. The product is adapted to special purposes, and in this country now furnishes most of the best boiler-plate (C. H. No. 1 Flange and better grades) and sheet-iron, while in Wales it makes tin-plate iron. The Lancashire and Walloon methods are most followed, the latter in Sweden, for the production of Dannemora iron.

In the Morfa tin-plate works, as described by Percy, and in the other Welsh works, the iron was first melted in a coke *melting finery*, and then about 250 pounds run into the charcoal *finery*, prepared from the previous heat. The cold blast was let on, and the iron becoming pasty, was broken up and exposed to the blast. In 43 minutes cinder was tapped off, and the metal begun to be pressed into a ball. The cinder was tapped out frequently, and in an hour the blast diminished. In 73 minutes the blast was lessened and the ball taken out and hammered into a flat slab, which is afterward broken up into stamps of 26 pounds each. These are then piled on a *porter-bar* (about 80 pounds), and being heated in a hollow coke-fire, like a blacksmith's fire, are welded, hammered into slabs about 6 inches wide and 3 inches thick. These slabs are nicked, and one-half double back, and welded on the other, so as to make both sides of the tin-plate alike, hammered down again, cut off from the bar and rolled into plates. This process is substantially used in Pittsburgh under the name of "knobbling fire."

In Sweden pig-iron is used in plates which have been broken up and heated beforehand by the waste heat of the fire. The hot fragments are placed in the hearth with the charcoal, and in half an hour the iron is melted down, and partially oxidizing, forms a cinder rich in iron. This cinder is left in when not too abundant, and the metal is worked in it and subjected to the refining proper for half an hour. Then the heat is increased, and the ball is formed and taken out, and about 1½ hours from the start is taken out, hammered, reheated, and hammered into bars for the English steel market.

This is in general the Lancashire process. The hearths now have commonly two tuyeres opposite each other, through which the blast enters at a pressure of 3.5 inches of mercury and about 220°. The charge is about 180 pounds of pig-iron, though sometimes as heavy as 290 pounds. The work goes on uninterruptedly for 6 days, with two to three men per shift with a production of 6 to 14 gross tons of blooms, a waste of 13 per cent. of the pig-iron, and the consumption of 1220 to 2064 pounds charcoal per ton.

The blooms are reheated in the Ekman reheating furnace with blast and wood, or in Siemens furnaces with the Lundin condenser for moisture in the gas from the sawdust or wet peat used. Loss of weight in heating, 9 to 12 per cent.

In the Dannemora district two hearths work together (Walloon method), one reheating the other's bloom, producing 8 to 12 gross tons per week with 4700 to 7000 pounds charcoal per ton.

In Pennsylvania a finery forge is worked with about 230 pounds in pigs laid on top of the charcoal, and the iron as melted drips down before the tuyere. When fully melted the blast is turned down upon the iron, which is also stirred with a bar. The cinder is let off frequently when soft weld-iron is desired, and the loup is squeezed with the bar to free it from cinder as much as possible. The loup is raised and forged into billets. A fire works 13 hours a day, making 6 loups, or about 1000 pounds, that is, about 3 tons per week. With *refined iron* 6 tons per week are made. About 0.9 tons charcoal and 24 cwt. of pig-iron are required to the ton of billets.

Steel made in fineries is produced by the Siegen, Styrian, and Carinthian methods, of which the Styrian is perhaps most widely practiced. Most of the cheap cutlery and mechanics' tools sold as German are made in Westphalia, or vicinity, of steel from the finery, and the Styrian *scythes*, the quality of which is highly renowned, are of steel from the Styrian finery forges. In Styria the hearth is 23 inches long, 20 broad, and 10 to 12 inches below the tuyere. It has a loam bottom, above which charcoal is stamped in. The white crystalline pig in flat cakes 2 or 3 inches thick and some finery cinder are first melted down for a bath in which to work the steel. The cinder should be greater in quantity and less rich in oxide of iron than when iron is intended. The steel from the previous heat is reheated in this bath, the new pig being allowed during the

reheating to melt and drop down before the tuyere. When the reheating is concluded, the iron will generally be found very near the proper degree of decarbonization, and the fining is then soon finished by working the metal up with a bar to expose it to the blast. The cinder is used to prevent the burning out carbon beyond proper amount, and is let out after the reheating, and perhaps once or twice more if too abundant. One heat requires about 3½ hours, and 2 fineries with 4 men make about 1200 pounds in 16 hours with the loss of 9 to 10 per cent. iron, and a consumption of charcoal of 297 to 338 pounds per 120 pounds of steel.

The process has the closest resemblance to that for iron, so that strangers can detect no difference, and the men themselves often make a lump of iron instead of steel. Not unfrequently one finery makes iron while the exactly similar one next it makes steel.

Puddling is at present the principal source of iron, the product of steel by this process being irregular in quality, and now mainly used for remelting in crucibles. For a long while after its first production in 1835 *puddled steel* was largely made, but has now been almost wholly superseded by *Bessemer steel.*

There are two kinds of puddling, viz., puddling proper, or *dry puddling* of pig-iron previously *refined*, as invented by Onions and made successful by Cort, both in 1784; and *wet puddling*, or *boiling*, as it is called, in which gray forge-iron is used without refining. Boiling makes the best iron, puddling probably the most. The distinction lies in the fact that in puddling the air acts more directly upon the iron, while in boiling the action is mainly through the cinder of silicate of protoxide of iron, which absorbs oxygen, giving it up to the carbon of the pig-iron. The great liquidity of both iron and cinder enables the impurities to separate more readily, and the iron to be purer, more uniform in composition, and freer from cinder than when puddled.

There have been many modifications of the process, the principal one of late years being a modification of the Uchatius (really Wood, 1761) steel process applied to pig-iron as it runs from the blast-furnace. Pulverized magnetic or specular ore was poured into the stream of iron, oxidizing the latter somewhat, but mainly chilling it into a mush, which, when cold, was termed *pig-bloom.* These were sweated or welded up in the heating furnace and rolled into bars. The process known as the *Ellershausen* wasted too much iron and attacked the furnace-bed too much, and has long gone out of use.

The *refinery* is a most important piece of apparatus at a works where common iron is made for rails and from forge pig specially smelted from puddling- and heating-furnace cinder with little "mine" ore, as in the Welsh works. There are two objects sought,—to remove silicon, graphite, and other elements from the iron, thereby making the iron *white*, to as great an extent as possible with reasonable waste; and by producing white iron to have a material which will be pasty as soon as melted, and require comparatively little labor and time for its conversion into weld-iron.

The modern refinery appears to have been invented in 1771 by Cockshutt, and is in general a rectangular hearth, say 40 inches wide, 60 long, and 12 to 18 deep, to contain about a ton of pig-iron. It has 3 tuyeres on each side inclining downward to the centre, and its sides and back are formed of hollow iron castings or "water-blocks," cooled by water; its bottom of sand, on solid brick-work, and the front a solid iron plate with a tap-hole. Coke is the fuel, and cold blast is used at 3 pounds per square inch. When refined, the metal is let out upon a long iron trough kept cool by water, on which it chills in plates, called *plate-metal* or *refined metal.*

The coke is thrown into the heated refinery, and on it about one ton of pig-iron with 30 pounds of hammer-scale. The metal melts in about 1½ hours under gentle blast, and after ½ hour of strong blowing with the production of considerable cinder, the metal and cinder is let out, water thrown on the cinder, and the metal separated in plates about 3 inches thick, generally honey-combed at the top. About ⅕ the iron represents weight of coke used, and 8 per cent. the waste of iron. Gray pig-iron, containing 3 per cent. silicon and 0.2 sulphur, will retain, after refining, about 0.3 per cent. silicon and 0.15 sulphur; white pig-iron, with 0.4 per cent. silicon and 2.0 per cent. sulphur, will retain about 0.1 silicon and 1.0 sulphur. Such white iron is cheap, but utterly useless without refining.

In all puddling processes the *furnace* is the same: a reverberatory furnace, with a bed about 60 inches long, 48 inches wide, covered by an arched roof 20 to 24 inches high. The roof inclines downward from the end next the fire-space, and the two sides converging also in the same direction, form with the bed a neck about 20 inches square, inclining downward to the draft-stack. The bed may be about 18 square feet, and the grate-surface 12 to 16 square feet, according to quality of coal used, and the whole construction is such as to throw the flame strongly down on the bed. The latter—originally sand—was in 1818 made of a single thickness of iron plates carefully joined, and usually cooled by air drawn through a chamber beneath them by the intense heat. The product was thus increased from 8 tons per week to 20 or 24 tons per week. All parts exposed to heat are cooled with water, and the door has a small hole through which all the work is done, the door itself being opened only to remove the balls.

In puddling, the heat is made on a bed formed on the iron bottom by melting and oxidizing scrap-iron to cinder, mixed with some cinder richest in iron from the furnace itself, and on this, when *hot*, about 500 to 600 pounds of refined iron are charged. When melted the whole soon comes into a pasty state, and is worked and stirred about by *rabbles* (iron bars). At first jets of flame are emitted like a fermentation, but afterward the iron becomes stiff, and must be broken up and exposed to the air. In about 45 minutes it begins to form metallic iron, and the whole soon comes to nature, and is carefully worked together, and then separated into 4 to 6 balls. At this stage the iron burns and the mass becomes decidedly hotter and more coherent, and absorbs the cinder formed, and the bed appears dry. The cinder is let out only once in two or more heats. In Wales 6 balls are got to a heat, and 8 heats worked in 12 hours, with a waste of 9 to 12 per cent.

In *boiling*, however, the furnace is differently prepared. On a bed, first made up like the other, ground specular ore or roasted cinder is thickly spread, and the sides are laid up thickly with the same ore or cinder, and the whole fired till it is solid, and with repairs will last a week. This material supplies a great reserve of oxidizing agents, the waste of which must be made good every day. After the cinder has been tapped off from the preceding heat, about 600 pounds of No. 3 iron or best gray forge of good quality are charged with about 120 pounds of roll scale, hammer-slag, and furnace-cinder. The furnace is carefully closed and fired hard for about 35 minutes, when the iron is melted. When partly melted it "frizzles" or simmers, and the boiler sees that no solid iron sticks to the bottom. The metal becomes covered with fluid cinder, and in about 48 minutes the bath looks as if in a full *boil*, jets of flame and metal spurting up constantly. It is kept well stirred, and in a few minutes becomes frothy, rises to the working-hole, and becomes whiter and hotter when the damper is lowered and the fire slackened somewhat. In about 65 minutes most of the iron "comes to nature," forming pasty masses in the bath of cinder, and the whole then sinks, becomes pasty, with little apparent fluid-cinder, and the boiler works the mass into 5 or more balls, with his rabble working out the cinder and patting the balls together. They seem to be in a bath of fluid-cinder, and in about 80 minutes the first ball is taken out and the rest follow at intervals of 2 minutes. While the metal is melting and the balls being taken out the furnace is kept full of somewhat smoky, reducing flame, but during the boil is kept sharply oxidizing, firing being done as lightly as possible. When the balls are out the cinder is tapped out, a little ore put in and the next heat charged. The boiler and his helper take turn about 7 times on usual forge-irons, each doing all he can. In working purer irons, like charcoal iron, the metal comes to nature in about 4 or 5 similar turns, the boiler always making the balls himself, as he is responsible and paid for good iron only. In the boiling process about ¾ to 1¼ tons of coal are required, according to quality, and owing to the ore used about as much iron is got out as is put in, the waste not exceeding 2 to 3 per cent. The product of a single furnace is about 12 tons a week on best quality iron, and of a double one about 22 tons.

The balls are taken hot as possible to a hammer or squeezer, the cinder quickly squeezed out, and the resulting longish cylinder rolled into puddle-bars about 2½ to 6 inches wide and ½ to 1 inch thick. These are nowadays the basis of all weld-iron manufacture.

In *rotary puddling*, principally by the Danks furnace, the most successful form of mechanical puddling-furnace yet introduced, the boiling process is substantially carried out as by hand. But the body or bed of the furnace being a cylinder rotating on its horizontal axis the charge is thoroughly stirred at all periods, and the ball is taken out whole, often weighing 1500 pounds. A charge of refined metal, about 1600 pounds in weight, can be puddled in 35 minutes, or a ton in 40 minutes, with a production of 50 to 85 tons per week. At Middleboro', England, 1000 pounds coal and 1000 pounds fettling (ore) were used per ton of bars with no loss of iron.

Mr. Williams, of Graff, Bennet & Co., says the Danks furnace as a worker of metals has no equal; as a melter is inferior to many; as to endurance, the shortest lived of any; as to repairs, one of the most difficult; as to quality of iron made, it has surpassed all others, standing pre-eminent; and as to product, 9 furnaces made on single turn in 37 days, or 1941 heats, 755 gross tons of bars, thus doubling the product of the puddling-furnace. Test made of the iron by the Keystone Bridge Company of a grade for bridge-work, showed an average tenacity of 67,972 pounds per square inch. A more ductile metal has been rolled thinner than 0.001 inch.

In 1850, *puddled steel* was regularly fabricated in Lippe, then in Westphalia, and soon afterward in England, all in the puddling-furnace in the same way as for wrought iron. The art essentially consists in a nice regulation of the temperature, and in arresting the process at the proper stage of decarbonization during the boil. About 450 to 500 pounds No. 3 or low No. 2 pig-iron are charged. If the iron be not manganiferous, manganese must be added in some shape to render the cinder more fluid; the amount of cinder is the same as in puddling. The pig is melted as usual, but then the temperature must be so reduced as to keep the bath in the consistency of thin cream, and the iron be well rabbled with the cinder. Boiling now takes place at a lower heat than for iron, but hot enough to enable thorough working, that the steel may be uniform. When the metal comes to nature in floating particles of steel the temperature must be lowered to yellow heat, but otherwise the operation of balling gone through with as usual. If the temperature at this stage be too high, iron results. The time occupied is about 15 to 20 minutes longer than for boiling, and the coal 1¼ to 1½ tons per ton of steel. Waste about the same as in puddling. Owing to its having so much manganese, and so little silicon, *spiegel iron* makes the best puddled steel. Of late years it has been principally used for heads of rails, and for remelting into cast steel. Much of the product of the Low Moor Works is really puddled steel of the softest grades. It is welded and wrought as iron is, but at slightly lower heat.

II. "*Ulster*" iron, coil bar for gun-tube; four times worked. McCreath.

III. Best neutral bar-iron from Etna Works of Spang, Chalfant & Co., Pittsburgh. McCreath.

IV. Average composition of *puddled steel* made at Ebbw Vale. Parry.

Bar-iron may be *converted* in a few hours into weld-steel by exposure at a white heat to carburetted hydrogen, or gases charged with carbon; but the only method practically followed to effect a similar conversion is that of *cementation*, a process more than 200 years old, having been described by Réaumur in 1722.

The converting oven is a large conical chimney, like that of a glass-house, containing at its base a long furnace with a high arch, under which two long chests of fire-brick slabs are placed side by side. These chests average 150 inches long by 32 wide and 36 deep. Below these chests a coal fire is placed, whose heat escapes by flues between the chests and up each side, so that the most uniform temperature may be secured for long periods. They are made as air-tight as possible. The iron bars—about ¾ inch thick by 3 inches broad and some 12 feet long—are placed at first on a bed of hard-wood charcoal (ground so as to go through a sieve of about ¼-inch mesh), on the flat and nearly touching each other, but with room for expansion in each direction. On these bars a layer of the same charcoal, ½ inch thick, is laid, then another layer of bars, another layer of charcoal, and so on till the chest is full with a charge of 8 to 9 tons, or 16 to 18 tons in the furnace. The whole is then covered with grinder's sand or swarf, in Sheffield, or clay, or loam, in a layer which must become air-tight when heated. Openings are left in the chests for removing special short test bars from time to time, but all openings are luted up tight during conversion. When ready the fire is started, and in 24 hours the chests reach a sufficient heat for cementation to take place. The heat is then kept steady for about 7 days for spring-steel, 8 days for shear-steel, and 9 to 10 days for steel for remelting in crucibles. When the trial bars show the proper "temper," all openings are closed, and very gradual cooling allowed for 4 days, when the furnace may be opened. About 27 per cent. charcoal and 80 per cent. coal are used to the steel produced; and the steel produced weighs 0.5 to 0.75 per cent. more than the iron charged.

After conversion the bars are covered with blisters of all sizes, whence the name *blister-steel*, used in the trade, and their internal structure has been entirely changed. Instead of being more or less fibrous, with bright, soft, gray color, the fracture has become very coarsely crystalline, with a dull whitish color, with great brittleness. They must be sorted by their fracture, and steel of the same "temper" kept together for subsequent use.

For the convenience of the trade six varieties have been graded and named, as follows:

No. 1.	Spring heat,	0.5	per cent. carbon.
" 2.	Country heat,	0.625	" "
" 3.	Single shear heat,	0.75	" "
" 4.	Double shear heat,	1.00	" "
" 5.	Steel through heat,	1.25	" "
" 6.	Melting heat,	1.50	" "

The spring heat shows steel round the outside of the bar, the inside having become crystalline and deadened in color. The envelope of steel gradually thickens, till in the double shear heat the fracture shows about equal parts of iron and steel, the latter rather predominating. The demarkation should be gradual, not an abrupt line. The steel through heat shows no iron, but small crystals of steel, while in the melting heat the crystals are large, often shooting across the whole thickness of the bar.

This easy method of selecting exactly the steel desired has led to the result that the highest grades of ingot or cast steel are almost exclusively made by remelting blister-steel. Sulphur is also removed by the process to a large extent, thus further improving the product.

The most probable theory of the process is that it is effected by the permeation of the iron by hydrocarbons evolved from the charcoal.

A modification of cementation, called *case-hardening*, is a valuable one. Iron forgings heated for some hours in a coating of nitrogenous matter, as horn, ferrocyanide of potassium, or leather parings. The surface of the forging becomes hard and capable of resisting great wear.

A process the reverse of cementation, although carried out in similar chests, is Tunner's process of converting cast-iron bars into steel by heating them in quartz sand with very slight access of air. It is practiced at Donawitz, in Styria. The pig-iron is Styrian white pig, from spathic iron ore, and the conversion requires 6 weeks. Four grades of steel are made,—No. 1 the hardest, No. 4 the softest. It is used for common purposes, though some of it is good enough for punches.

Ingot-Iron—Ingot-Steel.—As we have seen from the method of production, any kind of iron or steel not melted is apt to be more or less a *mush*, consisting of layers or particles of iron interlaid with cinder. For many purposes, both the cinder and the weakness of the weld along the line of cinder are great objections; but it was not till about 1760 that the problem of melting steel was solved by Huntsman at Attercliffe, near Sheffield. The Hindoo *wootz*, although melted, requires subsequent refining before use, while Huntsman's *cast steel* was ready for any application as it lay in the ingot.

For the production of ingot-iron, any *bar-iron* (weld-iron) *may be melted direct* with proper fluxes. This has been done in France. But Mushet, in 1800, while experimenting on the production of cast steel, found that if he melted iron with 0.0066 of its weight in charcoal "the resulting product occupies a kind of middle state between malleable iron and steel," and if he melted iron with only 0.005 "the quality resulting is nearly analogous to the fusion of iron *per se*, or that obtained by the fusion of iron with earths." This is the modern *homogeneous metal* at present synonymous with *ingot-iron*, and first so termed by Howell in a patent for it in 1856. The thin tubes exhibited in 1862 by Shortridge, Howell & Co. were so soft that they were mistaken for caoutchouc. By modern processes, especially the Siemens-Martin, ingot-iron may be made still softer.

Its principal sources at present are the Bessemer and Siemens-Martin processes, in which, by their easy attainment of high heat, and by means of *ferro-manganese*, with a large per cent. of manganese, iron with less than 0.1 per cent. carbon can readily be made. The Bethlehem Iron and Steel Co. have made a great deal of iron for wire drawing at Washburn & Moen Co.'s works with 0.12 to 0.14 per cent. carbon, by the Bessemer process. And the homogeneous iron boiler-plate, now so largely used, does not contain more than

0.10 to 0.18 per cent. carbon. The only difference between making these irons and the steels made by the same methods is that the decarbonization is carried further, and the recarbonization necessary to destroy oxides in the metal is effected with substances which contain as little carbon as possible. As the process is similar, and the amount of product the same in either, on iron or steel, full descriptions of methods will be given under those of ingot-steel.

We may premise that the steel known as cast steel was the only kind of ingot-steel known commercially before 1862, or in any quantity before 1866. Cast steel and German steel, both *true high steels*, comprised the whole of the material in use before those dates, while the use of any kind of *steel* on the large scale was unknown. What was not cutlery or tools was always *iron*. So rapid has been the progress of metallurgy in this branch during the last fifteen years, the most eventful known to the metallurgy of iron.

Cast steel may be made either in *pots or crucibles*, or in the Bessemer *converter*, or the Siemens-Martin *open-hearth furnace*.

The most ancient way of steel-making in pots is by *fusing compact iron with carbonaceous matter*. This is the method of the Hindoos. The production of *wootz*, the hardest variety of cast steel, is effected by fusing about 1¼ pounds of Hindoo iron with 531 grains of cassia-wood, in a small unbaked clay crucible holding about a pint. Fourteen of these closely luted are built up over a little circular pit in the ground, furnished with blast from a leathern bellows. Fuel is supplied through the top, and fusion effected in about 4 fours; 70 pots, or about 140 pounds, can be melted in a day, and the production of the district was formerly 152 cwt. annually.

This method has become the ordinary one, and since Heath's discovery of the application of manganese, in 1839, it produces all the ordinary varieties of cast or ingot steel. Huntsman's discoveries embraced a proper flux (reputed to be bottle-glass), probably the use of blister-steel, and the method of conducting the melting. The Sheffield furnaces now used are said to be identical with his. In many works, particularly on the continent of Europe, it has been customary to use *charcoal* as the carbonizing agent in the pot. But charcoal may be replaced by *spiegel iron*, or any pure *gray pig-iron* containing manganese. The impurities of the pig go over, of course, into the steel, but for common grades, where cheapness is desirable, this has been held to be no insuperable objection.

For many years a second method of *melting pig-iron in contact with substances capable of yielding oxygen* was formerly experimented with. It is very old, but was revived in 1855 as the *Uchatius* process by the Austrian general of that name. Spiegel iron, or pure white iron granulated or in small pieces, is charged in a pot with 20 per cent. roasted and powdered spathic iron ore, or corresponding quantity of other pure ore, and 4 per cent. clay, and melted in an ordinary steel furnace. The finer the granulation the softer the steel, and charcoal must be added for the harder sorts of steel. It is useful only for small quantities of very pure material, and is generally inclined to be honey-combed in the ingot. It is now unimportant in a manufacturing sense.

The third plan which has been generally followed in Sheffield for the best steel is to *remelt blister-steel assorted so as to produce the desired hardness*. The best and most uniform steel is undoubtedly attained by this method. It may be varied with advantage by using Bessemer steel of various grades. In 1839, Heath introduced the use of a *carburet of manganese*, really a compound of manganese and carbon, containing a considerable quantity of silicon, according to Henry, and found that 1 to 3 per cent. of it would yield malleable, weldable cast steel from blister-steel of low-priced British bar-iron. Before this invention only blistered Swedish or Russian bars could be used. Manganese is a correction of red shortness, so that cast steel, which could only be hammered or rolled at a low red heat, may be worked at even a welding temperature when combined with 0.2 to 0.5 per cent. The presence of more than 0.3 per cent. undoubtedly increases the brittleness of the metal when cold, and in tool-steel the less the better, on account of its tendency to cause cracking in hardening.

Mr. Seebohm gives the following estimate of the effect of these methods on crucible tool-steel with 1.0 per cent. carbon. It may be made in four ways:

A. Charging blister-steel double shear heat known to contain 1.0 per cent. carbon.

B. Charging 50 pounds unconverted iron and 8 ounces charcoal.

C. Charging 40 pounds unconverted iron and 10 pounds spiegel iron with 5 per cent. carbon.

D. Charging 34 pounds blister-steel through heat-steel of 1¼ per cent. carbon with 16 pounds mild steel scrap containing ½ per cent. carbon. The value of each method is indicated by the order of the letter after the quality stated.

Welding easiest	B	C	A	D
Combining most hardness and most elasticity when hardened	A	D	B	C
Hardest and toughest when unhardened	C	B	A	D
Soundest ingots	C	D	B	A
Least tendency to water crack in hardening	D	B	A	C

Cast steel is melted in England mostly in clay pots, and in this country mostly in plumbago pots, the greater product of the latter offsetting the cheapness of the former. The clay pots, weight about 25 pounds each, are made of 88 per cent. fire-clay, 8 per cent. old pots, and 4 per cent. coke cinders; plumbago pots are about 44 per cent. graphite, 44 of burnt clay or old pots, and 12 per cent. fresh clay. They are about 16 inches high, 8 inches wide at the middle, and taper more to the bottom than to the top. They hold about 50 pounds for the clay, or 100 pounds for the plumbago pots. Before using they are brought to red heat, and always kept so, lasting about 3 meltings. Two such pots are placed in a square furnace, about 40 inches deep, 32 inches on a side, the opening being on the floor-level, on a "stand," a circular brick resting on the grate-bars. The pots are charged with funnel-shaped charges, holding the full charge, covered with refractory covers, the furnace filled with coke or anthracite, and full draft applied. In 45 minutes the furnace is refilled with fuel, and in 45 minutes more the melter takes off the lid, and putting more or less fuel in, according to the state of fusion. The full fusion is got as the white hot fuel descends below the top of the pot,

and the metal must present a perfectly quiet, brilliant, mirror-like surface, with a little perfectly fluid slag. When thus "*dead melted*," as it is termed, the melter encases his legs in gunny-bags, wets them thoroughly, and standing immediately over the hole, pulls up the pot on the floor with a pair of tongs; a boy knocks the cover off, and the melter pours the steel into the ingot-mold. The ingot may be made of any size, but for tool-steel one about 3 inches square by 12 to 18 inches long is usual. If properly melted the ingot, with 1 per cent. carbon, will "pipe" at the top,—that is, the steel will remain fluid, so that the top can feed the bottom of the ingot, making it sound. When used the top is broken off. The pipe may extend so far down as to render the ingot useless.

The consumption of fuel is about 3½ times the weight of steel produced, and the waste about 4 per cent. in melting; 12 per cent. loss in forging, and also 12 per cent. from ends and rejected bars.

Although the product of the single pot is so small, yet a system of organization and mechanical appliances for raising the pots up and quickly transporting them to a pool, in which at least 2 pots are always pouring (so as to insure a continuous stream into the mold), enabled Krupp as early as 1862 to make castings of 25 tons weight. Since then he has made even 50-ton ingots. His method of making forgings may be briefly described as follows, with a probability of accuracy:

Krupp has 1600 pots at disposal, each holding 70 pounds of steel. The product is a soft steel with about 0.5 per cent. carbon, obtained by melting puddled or Bessemer steel with iron, special attention being paid to uniformity of grade. The ingots are made in a cast-iron mold in a casting-pit, and cast solid. The pots as they come are poured into a pool over the mold, out of the bottom of which the stream of steel falls, thus separating cinder, etc. As soon as cooled sufficiently to handle, the ingot is placed in a bed of ashes to anneal for several months, coal being thrown on occasionally to keep up the heat. Great stress is laid on this annealing as the vital part of the treatment. The ingots are then put into large furnaces, most carefully and slowly heated through, to secure uniform work, and forged under 25-ton or 50-ton hammers according to size. A large excess of metal is used, the forging losing half its weight in the lathe, counting, of course, the bore cut out by a Wahlbach drill, which leaves a core.

The writer is enabled, however, to give an account of ordnance steel manufacture at Obuchow, Imperial Russian Ordnance Works, which is authentic, having been reported by Tunner in 1871 at the instance of the Russian government. The *works* are in the form of a Latin cross of equal arms, the casting-pit at the centre with a dome roof over it. In each arm there are 20 melting-fires, 10 on a front standing back to back, each fire with 4 pots, or 320 pots available in each arm, or 1280 in the works. Each pot holds 72 pounds, or together 92,160 pounds, so that castings of 41 gross tons can be made if necessary. The *raw materials* are puddled steel from Siberian charcoal pig-iron, English coke for melting, English coal for the puddling and heating furnaces, and wood for the other operations. The puddled steel bars are sorted into 3 grades, the relative quantity of which is fixed in the charge by the grade of steel desired. No spiegel iron or bar-iron is added to the charge. In *melting* the pot is charged cold, and only used once; it is gently heated for 1½ hours and then for 3 hours with full draft, 300 pounds of coke being required to melt 100 pounds of steel. Tunner saw an ingot cast from 112 pots each of 71½ pounds; the ingot weighed 8000 pounds, and 42 men were engaged about it. The *mold* was in two halves vertically, with usual bottom plate, and a bracket upon the rim of the pit sustained the pouring-ladle or pool, which had an opening 1⅝ inch diameter at centre of its bottom, and held about a ton of steel. An equal number of fires in two opposite arms of the cross were used, consequently the pots were continually brought to each side of the pool. They were so quickly brought that 2 or 3 full ones were always waiting on each side to be taken up by two men each, emptied, and thrown away. At the pool on opposite sides stood 2 men with poles to help in pouring, and occasionally skim the steel. In pouring, the pots remaining covered were emptied through a semicircular hole. Generally 2 pots were pouring at once, sometimes only one, and once for a few seconds none, without interrupting the stream into the mold; but toward the last, when the men were tired and delayed in pulling the pots up out of the fires, the stream was twice momentarily interrupted without injury of any kind. The pouring lasted 9 minutes, at the rate of 12 to 13 pots per minute; the pool was then quickly swung away, the top of the steel covered with fine sand, then with a thin iron plate, on top of which a good deal of sand was thrown. In the case of heavy castings, where 4 or often 6 pots are pouring together, a runner is used with several arms, each emptying into the pool. The pool is also much larger, and remains closed till a good deal of steel is collected. The ingots were *forged* under a 35-ton hammer, which was found too light for guns over 9-inch calibre, and in 1871 one of 50 tons was erected. Four *specimens* for testing were taken from each forging,—outside, centre, and each end. The *tubes* for guns were *tempered in oil*, but in the Imperial Works at Perm this was not done, as it was not believed to increase the strength. When rough turned and bored, the tubes, or bodies of guns, were heated singly in a special gas-furnace, in which the tube lies between two rows of small exit flues, and is slowly heated to a uniform red heat. Withdrawn from this furnace, the tube is lifted by a crane raised high on a masonry pedestal, lowered vertically into, and kept for 5 to 8 minutes in, an iron tank of oil surrounded by water. It is then raised and lowered into an adjacent brick shaft or oven, previously well heated with wood, where it is left 24 hours to cool, with a cover over the mouth of the oven. On removal it is so warm that the hand can scarcely be held on it.

The Imperial Works at Perm went into operation in 1867; produced in two years 19 8-inch steel guns, a trial 9-inch, and several small guns, and in 1870, after the expenditure of $1,213,000, were able to produce yearly 40 steel guns of 8-inch calibre. The works were like the Obuchow works, except that the melting-furnaces were blown by fans, requiring each 250 cubic feet

of air per minute. The pots hold 63 pounds, are made of a mixture of fire-clay, old pots, and graphite, 32 per cent. each, with 4 per cent. of birch charcoal. When new they weigh 42 pounds; after drying 6 weeks at 100°, and 6 weeks more at 212°, they weigh 34 pounds, ready for use. The *raw material* is puddled steel made at the works from Siberian pig, and graded into three sorts,—first, full steel; second, steel containing some iron; third, that which when hardened still bends and is hard to break. The charge used for soft steel is 50.6 pounds hard steel, 8.8 pounds soft steel, and 2.75 pounds pure, powdered magnetic ore. The *melting* requires 5 to 6 hours in all, and for 100 pounds steel ingots 700 to 900 pounds of pine charcoal are used. Tunner saw a 4½-ton ingot cast which required 60 fires, or 180 pots in all; also 75 men at the fires, and as many more for the other work, or 150 in all. The *molds*, in two halves, are 2 to 4 inches thick, and weigh about as much as the ingots cast in them. The 4½-ton ingot was cast in 10 minutes *without* a pool, the mold being covered by an iron plate with two 8-inch holes. At each hole stood a man with a pole to aid two others, who, with pouring-tongs, lifted and emptied the pots. All movements were made on the run, and the places for the full and empty pots distinctly understood, a regular drill preceding casting.

Tunner saw an 11-ton ingot *forged* under their 16-ton hammer with steam over the piston. Under this hammer the forging of 16-ton ingots for the bodies of 9-inch guns was effected with the greatest difficulty; breakages of the tup, the piston-rod, and dies were frequent. Here, also, a 50-ton hammer was being erected.

The 11-ton ingot, a square block 31 inches on a side, and with the corners taken off, was handled by means of a *porter-bar* of iron 20 feet long by 1 foot square, on one end of which 4 clamps were fastened. Just behind the clamps was a disk like a capstan-head for bars to turn the forging, and at the far end two heavy counterweights. The clamps were heated, fitted to the ingot, and fastened to it by iron bands shrunk over them. The crane chain was slung so as to leave a preponderance to the ingot, which was raised, when required, by the weight of the workmen on the far end of the porter-bar. Some 40 men were required on the bar, 10 on the cranks, and 10 to swing the heavy hand-crane used.

The ingot was heated to a full yellow heat in 15 hours, or rather the half of its length inside the furnace. It was then forged 35 minutes, returned to the heating furnace for a wash-heat of about 2 hours, and in 40 minutes further forging, the top of the ingot was drawn out to 11 inches square, and 7 feet long. The first porter-bar is withdrawn and another fastened to the forged end of the ingot. The bottom half, which is to form the gun, is then heated for 12 hours, and forged down to an octagon to contain, inscribed, the cylinder desired. The forging is then heated for the fourth time, and drawn down to a cylindrical form carefully measured. For an 8-inch gun the forging was 20 inches in diameter by 10 feet long. The top part, 11 inches square, is now cut off under the hammer, a porter-bar fastened to the lower end of the forging (or ingot), and the free end heated for the fifth time, and forged into a cone about 7 feet long for the chase of the gun; this operation often requires a sixth heat before its satisfactory completion. The forging is at least 1½ inch greater in diameter than the finished gun.

The forging of the *rings* is followed in the same way so far as the cylinder, which is then cut up under the hammer into a number of disks of proper thickness. These are then punched, and the holes worked out over the horn of the anvil to the proper diameter. For the trunnion-bands the disks are forged elliptical, and as nearly as possible to shape while the hole is being worked out. The trunnions are afterward cut out by machine tools.

The cost of the finished guns was stated to be 75 cents per pound for 8- and 9-inch guns.

The chemical composition according to a series of analyses, unfortunately incomplete, averaged as follows:

	Pig-Iron.	Tube-Steel.	Ring-Steel.
Graphite	3.03	0.21	0.30
Combined carbon	not det'd	0.338	0.375
Silicium	0.66	0.15	0.27
Sulphur	trace	not det'd	not det'd
Copper	0.04	0.04	0.02

The steel for the *tube* or body of the gun varies as to its elastic limit from 30,000 to 40,000 pounds, with an extension of 0.8 to 1.8 per cent., and as to its ultimate tenacity from 70,000 to 85,000 pounds, with an extension at fracture of 8 to 20 per cent. The steel of the *rings* has its elastic limit between 46,000 and 54,000 pounds, with an extension of 0.14 to 0.16 per cent., while its ultimate tenacity is 80,000 to 100,000 pounds per square inch, with an extension of 6 to 10 per cent. It owes its greater strength largely to its having suffered a comparatively great amount of work under the hammer.

The rings are selected for each tube according to their respective mechanical tests, in order that they may support the tube equally and uniformly, leaving no weak portions. For a 9-inch gun, the body forged out of a 16-ton ingot, 120 tests for tenacity were executed for the proper selection of the parts.

The tube or body of this 9-inch gun weighed, when finished, 14,410 pounds; the rings, 21 in number, including trunnion-band weighed 21,615 pounds; the breech-plug on the Chambers or French system weighed 1622 pounds with the noseplate and Broadwell ring. The length of bore was 173 inches, number of grooves 32, their depth being 0.11 inch; the length of an entire revolution of the grooves was 540 inches. The weight of shot was 278 pounds, and that of the powder 47 pounds; with this charge the gun had been fired 700 times without injury or any change worth mention.

The method of hardening *mild steel in oil*, practiced at the Royal Gun-Factory, Woolwich, may be described as follows: A tube of mild cast steel is placed, perpendicularly, in a vertical furnace, upon an iron coil about 6 inches deep and an inch larger in diameter than the tube. This coil rests upon an iron plate laid on the grate-bars of the furnace, to prevent passage of air through the coil. Previous to receiving the steel the furnace has been heated to a red heat with wood, and the coil becomes filled with wood ashes. When the tube is put in its lower end is first carefully heated to a low red heat with short blocks of wood and damper nearly down. The

tube is then entirely surrounded with cord-wood, and slowly heated to a bright-red heat. At this point the damper is closed for a while, that the steel may soak or receive a uniform temperature. The more equable the temperature of the steel the straighter the block will keep and the more uniform the temper.

When the steel has reached a proper heat throughout, a traveling-crane lifts the tube out with a pair of tongs and lowers it into the oil-tank, about 20 feet deep and holding several hundred gallons. The oil-tank is cylindrical and funished with covers closing round the chain, and stands in a cylindrical water-tank sunk vertically endwise into the ground. The tube has a narrow collar turned round the top to prevent the tongs from slipping. When the red-hot tube is lowered into the tank the surface oil takes fire, but the flame is extinguished by closing the covers and covering them with canvas. A gentle stream of water kept flowing through the outer tank gradually carries off the heat of the oil, so that the tube cools uniformly in about 12 hours. The coating of charred oil round the steel retards its rate of cooling.

This operation in soft steel is really annealing, the interior metal varying little from the outer; on harder steel some noticeable hardening takes place. But in both the tenacity and ductility are greatly increased, thus rendering the steel tougher. This effect is probably caused by the removal of internal strains in the metal of the tube and its uniformity of molecular state, caused by the slow cooling in a liquid of low conducting power.

A competent metallurgist filling out this outline with his own experience will not fail of making proper steel forgings for ordnance. After an experience of more than 7 years in charge of special steel-making, during which the metallurgical problems relating to the introduction of Bessemer steel-making into this country were successfully solved, it is the conviction of the writer that there are *no secrets in the pots of Abouchoff*, or of any other works, that amount to anything more than the satisfaction of personal vanity. Krupp offers to lend a gun for £15,000 sterling to the British or United States governments, provided either will guarantee an order to him of £2,000,000 sterling should the trial prove satisfactory. Now, if the United States will make a similar contract with its own citizens, the writer has authority for asserting that the necessary capital will be forthcoming to make the guns here in the best possible manner. An 8-inch "Krupp" breech-loader, constructed by the South Boston Foundry on the designs of the Ordnance Department, has already fired 700 rounds, 180 pounds Butler battering shot and 35 pounds hexagonal powder, without the slightest injury.

The reasons why such works have not hitherto been established in this country, are the absence of proper spirit and foresight on the part of Congress, and the consequent piddling character of orders received by the Ordnance-Foundries since the war. The establishments of Krupp and Firth owe the existence of their ordnance departments, at least, to the direct encouragement of their respective governments by the advance of capital, it is believed to Krupp, but to both by the assurance of steady work.

It is difficult to adduce reliable characteristic analyses of crucible steel, there are so few accessible. No. I. is an analysis of *wootz* by Henry. It is a red, short, brittle steel, capable of being worked only at a dark-red heat. No. II. Characteristic softest tool cast steel, except as to sulphur, which is rather high. Analyst, Dick. No. III. Analysis by Abel of a cast steel Krupp gun, which exploded on first fire. Steel is too high in carbon and silicium. No. IV. Average of 3 samples of Vicker's crucible steel axles of great toughness. McCreath.

In 1856, Mr. Bessemer communicated to the British Association a paper on the "*Manufacture of Iron and Steel without Fuel*," meaning by this title the production of iron or steel from molten pig-iron without any other fuel than the carbon, silicon, manganese, and a small part of the iron therein contained. The combustion of these elements is effected by means of air forced at a high pressure up through the molten metal from below in numerous streams, so that it may completely search and penetrate every part of the metal. The air causes a rapid increase in the temperature, the metal coming rapidly to an intense white heat. Bessemer clearly discovered the fact that malleable iron could thus be produced, but for some reason failed to make his ingots merchantable, as they were more or less unsound from honey-combing,—unworkable from oxide of iron contained in the metal. This difficulty was removed by Mushet, who, in 1856, poured spiegel iron, or a triple compound of iron, manganese, and carbon, into the malleable iron. The carbon of the spiegel removes the oxide from the metal, while most of its manganese remains behind in the steel to remove the red shortness of the latter and render it sound and workable.

The process was carried on in this country under the patents of Kelly, as well as Mushet and Bessemer, all relating to the process having now expired. But it would seem that Martien had equal claims with Kelly, both having had in mind the operation of *refining*, in which Kelly seems to have been anticipated some 300 years by the operation of *refining in the blast-furnace itself*, practiced in the Eifel Mountains.

Special machinery was invented by Bessemer for the process. The mixture of gray iron is melted in a cupola, the spiegel iron preferably in a cupola. The gray iron is then run into a large, nearly spherical *vessel* or *converter*, which can be rotated on trunnions, and has an opening below for the *tuyere box* and another large opening or *nose* at the top for the emission of the gases. The blast passing through one of the trunnions, may be supplied to the converter in any position of the latter, and going down from that trunnion through a pipe into the tuyere box, it enters the

interior through 8 to 15 tuyeres, each with 12 holes about ⅝ inch diameter,—that is, an area of about 2.0 to 3.0 square inches per ton of metal, and at a pressure of 15 to 28 pounds per square inch. The metal is poured into the *belly* of the vessel while horizontal, the blast is let on to protect the tuyeres and tuyere box, and the vessel is rotated into the vertical position by a rack driven by a hydraulic cylinder at 300 pounds pressure, meshing into a pinion keyed on to that trunnion, through which the blast does not enter; range of rotation usually about 260°. After the *blowing* has continued long enough, the *spiegel* is run in and the contents of the converter emptied into a large pouring-ladle, which is supported on a hydraulic crane, so as to be readily raised, lowered, and swung around from the vessel to the ingot-molds, which are ranged in a circle round the casting-pit. When the ladle comes over the first ingot-mold a *stopper* is lifted from the fire-brick *nozzle*, in which it fits, and a stream of steel is let out. The stopper is keyed on an iron rod covered with loam, which, curving over the side, runs down through the steel, and at the front is held in a frame, which is raised and lowered by a lever. After pouring, the cinder that remains in the ladle is got rid of by rotating the ladle (by gearing on its trunnions) upside down, when the cinder runs out. The ladles are lined with a mixture of sand and loam.

In the English type of plant the casting-pit is deep and contracted, and the cranes are self-contained, the leverage afforded the ram being so short as to make the crane weak and expensive. In the American type of plant introduced by Holley, he has added to the details of the English a ladle to collect molten iron before conversion, a platform round the converters, and the crane-rams are guided in the roof as well as below. Both types are expensive, and a third has been designed by the writer with the view of cheapness and still further handiness of work, one of which is now being erected at Pittsburgh.

The *process* requires pure gray pig-iron, with about 2.5 per cent. silicon, less than 0.05 sulphur, and 0.08 phosphorus, and 0.05 copper, and advantageously with 1.0 per cent. of manganese. If more manganese be present the flame is obscured, and if the iron be too gray, the conversion lasts too long; 6 tons of steel should be converted in 14 to 20 minutes. In the course of blowing three *periods* are easily distinguished. The *first*, in a blow of 15 minutes, on hot metal, lasts about 5 minutes, and during it the graphite is converted to combined carbon, and the silicon and most of the manganese are burnt out, some of the iron being also burnt; this period is marked by an intense heat, and a weak, rather reddish flame, gradually becoming brighter. The *second* period is marked by the characteristic pasty condition of white iron, and the burning out of the carbon, as in the *boil* in a puddling-furnace. The metal froths up like soda-water, often filling the vessel and slopping over. The carbonic oxide generated carries off a great deal of heat, facilitating the conversion, just as the cooling does during the boil. The flame is very hot, full, yellow, and intensely brilliant like the sun. The third period begins at the 12th to 13th minute after the carbon has been nearly burnt out, and is marked by a transparent bluish flame and a cessation of brilliancy. Iron-smoke indicates the combustion of iron, and the heat rises rapidly. The removal of the last portions of carbon proceeds slowly; the hotter the metal is the less is the carbon acted on, and it is never wholly removed in a well-conducted blow for *steel*. This *third* period lasts 2 to 3 minutes, and the end of the blow is marked by a sudden cessation of light and dropping or drawing in of the flame, which has previously fluttered a good deal, as the carbonic oxide ceased being evolved. The heat generated is so intense as to maintain iron itself in fusion 15 or 20 minutes. About 0.1 per cent. carbon remains in the metal at the end of the blow. But as considerable oxide of iron remains in the metal at this stage, it must be removed by adding spiegel iron, usually melted, which diffuses itself through the metal, its carbon burning out the oxide with a brilliant burst of flame and the sound of boiling, heard, in a good heat, all over the shop. The steel, now ready, is poured into the ladle, running out in a milk-white, limpid stream. When *iron* is being made the blow is kept slightly longer, and the removal of oxide of iron effected by ferro-manganese,—70 per cent. manganese, 30 per cent. iron and carbon,—which is heated and thrown in lumps into the metal.

The *heat* in the metal must be kept high for successful working, and the blast strong. With very graphitic iron the writer has known blows 60 minutes long successfully made, and trials have been made with spiegel iron (8 to 10 per cent.) in which the blow lasted only 8 or 9 minutes, half the metal being thrown out by the violent frothing. A mixture averaging between Nos. 2 and 3 pig is about the best, and the waste should not exceed 12 per cent., nor the scrap-steel 3 per cent., while the ingots in good work should not be less than 85 per cent. About 0.4 to 0.5 ton of fuel is used, per ton of ingots cast, for the blowing engines and cupolas and warming vessels and ladles.

At Neuberg, an Imperial Austrian steel-works, the Bessemer steel as it comes from the converter is poured into an open-hearth Siemens furnace, where it is held in fusion at the highest heat, and *refined* by testing and supplying qualities needed. By this means the grade and quality of the steel may be very largely controlled. A metal of high quality, known as *Refined Bessemer*, is thus made there for ordnance purposes, which is very little inferior to the best pot steel.

Good steel should not rise in the ingot-mold, should throw off gas with slight effervescence while pouring, and should not form honey-comb or sponge-like surfaces anywhere except at the very top of the ingot. It is best made sound by casting it from the top into large molds holding 2 tons or more, and subjecting the metal immediately to the compressing action of a hydraulic press (Whitworth), or in ordinary work to the pressure of steam at least 100 pounds to the square inch (Jones). The fracture should be coarsely crystalline, with a mild grayish-white color and a rather fatty glance. If the color be white and the glance hard and "staring," the steel is cold short and brittle.

The gases cannot escape from low steel and iron as readily as from high steel, and in both large ingots are exposed to unsoundness or even to cracking during cooling. Whitworth states that extreme pressures like 20 tons per square inch would drive out the gas and compress the

metal to absolute soundness. Five minutes after application of pressure the ingot has shortened one-eighth of its length. After suffering 20 tons per square inch the ingots are strong and ductile as if worked, but at low pressures the ingot requires further working. To facilitate compression Whitworth casts hollow.

The *product* of American Bessemer works has been steadily increasing owing to improvements in cupolas, vessel bottoms, and refractory materials. The process became a commercial success at the Pennsylvania Steel-Works in 1869. Their steel department was built in 1867 for 3 blows, or 14 tons ingots, per day, at a cost of $600,000. In 1868 it made 8 blows, or 34 tons steel, per half-day; in 1869 they were able to make per day about 80 tons; in 1870 the greatest product was 162 tons in a day; and in 1873 in a week 180 blows, or 890 tons of ingots; in 1874 the Troy (Rensselaer) works made 972 tons ingots in a week; in 1876 the Cambria (Johnstown) works made 1475 tons per week, 6075 tons per month, and the North Chicago works 1583 tons per week, and 6457 per month, as the greatest product. Now the leading works is probably the Edgar Thomson, at Braddock's Field, and its figures, furnished by Mr. Jones, exhibit not only the wonderful results attained, but also the relations of the products of the Bessemer process.

The operations for 5 months, January 27 to June 30, 1880, are as follows:

		Gross Tons.
Total pig, spiegel, and scrap *melted*		64,619 31
Per cent. ingots yielded	85.78	55,428.75
" scrap "	3.50	2,262.08
" loss made	10.72	6,928.48
(Of the loss, 4.21 was in cupola.)		
Total ingots *bloomed*		55,782.56
Per cent. blooms produced	94.67	52,807.76
" scrap "	3.91	2,181.51
" loss made	1.42	793.29
Total blooms rolled into rails:		
Per cent. rails produced	89.02	43,272.33
" scrap "	7.57	3,678.34
" loss made.	3.41	1,656.40
Total blooms *hammered*		1,722.34
" ingots "		158.65
Total		1,880.99
Per cent. billets produced	90.85	1,708.91
" scrap "	5.69	107.00
" loss made	3.46	65.07
Quality of product:		
Per cent. first quality of rails	98.95	
" second "	1.05	
Largest product in 24 hours:		
Ingots		506.51
Rails		445.00

The effect of the process may be best shown by the following analyses of Neuberg (Styria) charcoal pig and its products:

VI. Good Bessemer steel rail from Ternitz. Kerpely. VII. Good Sheffield Bessemer rail. VIII. Cold short Bessemer rail, too high in phosphorus. IX. Red short Bessemer rail, too high in sulphur and copper. X. Rotten red short Bessemer (iron) rail, too high in sulphur and phosphorus, and too low in carbon and manganese to counteract the red short tendency; last three under writer's own observation. XI. Bessemer iron unusually free from all foreign constituents. Analyst, Abel, quoted by then Col. Sir Eardley Wilmot. XII. Bessemer iron, Armstrong 6-pounder, made in 1858. Riley. XIII. Tool-steel made at Graz Bessemer Works. Probiramt, Vienna.

Although the production of steel by the method of *dissolving iron in a bath of pig-iron* was described by Agricola and Biringuccio in the 16th century, yet the method progressed substantially no further till about 1860. Shortly after that date the Emperor Napoleon paid the expenses of a trial by M. Sudre of melting steel in a reverberatory furnace. Fusion was effected under a covering of bottle-glass, or blast-furnace cinder, without altering the qualities of the steel, of which 2 tons could be melted in the furnace with a notable economy of fuel. But it was not till the Siemens regenerative furnace was used by Martin, at Sireuil, in France, that the process became a success. It was largely used at first for the production of a soft ingot-iron for Chassépot barrels, just as the Springfield Armory now uses the same material from the Midvale Steel-Works. It was used till about 1872 principally as an adjunct of the Bessemer process, except at the Landore Works at Swansea, where everything was made by it. But since that date the improvement in refractory materials, and the general increase in the size of the furnaces used, have made the process an economical one everywhere, except for rails, in which it cannot compete with Bessemer steel.

The *gas-furnaces* used have an *open* hearth of the most refractory sand rammed upon cast-iron plates, cooled below by air, and covered with an

arch of Dinas or similar silica brick. The regenerative chambers are located below the hearth and below the level of the floor, two on each side, one each for gas and for air. A main flue is at each end of the furnace, communicating downward with both chambers. When at work the gases pass at their exit through two chambers, parting with their heat, which is taken up again by reversing the current so as to throw the fresh gas and air through the hot chambers. As the hot gas meets the hot air above the flue it burns with an intensely hot flame, which may be kept at will reducing, oxidizing, or neutral for long periods, thus meeting the necessities of steel melting.

The *hearths* usually have a length of 13 to 18 feet, and a width of 6.5 to 10 feet, the arch being 31 to 39 inches high at the centre. They have a door on the working side, and the steel is tapped out on the other side into a ladle, either on a crane, like the Bessemer ladle, or running along on a car over the ingots placed in a straight line. A large part of the working side of the furnace is capable of being taken down for hearth repairs, and quickly built up. In order to save the furnace as much as possible, the charges, except pig-iron, are heated in a special smaller furnace.

The *process* consists in first melting a bath of pure gray pig-iron,—the more pig being charged the more wrought scrap-iron is intended to be used. When the bath is fully melted and the hearth clean, the first iron or steel is charged about a full red heat in lots of 100 to 400 pounds. The metal is rabbled with a bar, and this process repeated till the charge is all melted. Steel is usually charged before iron scrap, and with steel alone about 10 times the weight of the pig bath can be charged. Tests are dipped with a ladle, cooled in water and broken, and spiegel iron or ferro-manganese are added, as in the Bessemer process, in kind and quantity according to the material sought, whether iron or steel. When the fracture indicates sufficient decarbonization the metal is tapped and cast.

The charge melted is seldom under 2 tons or over 15 tons. For a charge of about 6 tons the proportions would be about as follows: 2640 pounds pig-iron, 3410 pounds steel scrap, and 6864 iron scrap, with from 935 to 1265 pounds of spiegel iron added at the last. The waste by oxidation averages about 6 per cent., and the fuel used is about ton for ton. Two or three heats are made in a day, 17 per week being good work.

The purity of the steel depends on that of the pig used and that of the scrap. The latter if iron may have a serious amount of cinder in it, which is disadvantageous here, as well as in the crucible. But with proper care as to purity, and the use of the Martin process, steel very closely approaching the best crucible steel may be made in the open-hearth furnace with far greater convenience of manipulation. Of course, a number of the methods previously described may be applied in the open-hearth furnace with the view of greater cheapness, prominent among which is the *pig and ore* process, in which the pig is decarbonized by the oxygen of lumps of ore thrown in it; the iron of the ore being also reduced and adding to the product. After special experience required to keep oxygen out of the metal was attained, this process was found well suited to structural uses. With the same case as to exclusion of oxygen in the early periods of the melting, absolutely sound ingots, by the scrap process, have been made of the best grade for ordnance purposes.

By the cheap production of pig-iron rich in manganese (20 per cent.) and silicon (10 per cent.) the Terre Noire Company have been able to carry out the ideas of Schafhäutt, Bessemer, and Chernoff in regard to steel, and produce steel castings of remarkable quality. They are capable of being tempered, and thereby, it is claimed, receive without hammering the properties of wrought steel. The name "cast steel without blow-holes" is given it and the metal, and it contains from 0.26 to 0.55 per cent. silicon and 0.41 to 1.05 per cent. manganese, with 0.26 to 0.65 per cent. carbon. The steel is made in the open-hearth furnace, very much in the usual way, but with care as to the point at which the special manganese-silicon-pig is introduced. When cast the articles are tempered at a good cherry-red, with very gradual heating and careful cooling in oil. Projectiles, after tempering, show a density of 7.9, which is quite high, and is apparently due to a hardening of the steel and consequent compression.

The higher the carbon in steel the less must be the quantity of the deleterious elements, silicon, sulphur, phosphorus. The highest grade metal must be practically free from sulphur and phosphorus, and the less the quantity of all the better will all steel stand concussive or repeated shocks. Now, by diminishing the carbon the percentage of these elements may be increased without great injury to ordinary metal. Since the cheap production of ferro-manganese at Terre Noire with little carbon, these works have introduced a so-called "*phosphorus steel*," the main merit of which is the cheap conversion of old iron rails into steel rails. Where rails with 0.4 to 0.6 per cent. carbon could stand no more than 0.8 per cent. phosphorus, the phosphorus steel with less than 0.2 per cent. carbon could carry 0.2 to 0.3 per cent. phosphorus, with 0.5 to 1.0 per cent. manganese, which has an advantageous effect on the metal. This variety of steel is inferior (*v.* tests of Etna iron bars for cold shortness), and requires heavier machinery for rolling, as it cannot be worked so hot as purer metal.

Trials of various steels, at Creusot, showed that Siemens-Martin steel of the softest grade was found admirably adapted for ordnance (the trial guns being of 3 to 3.74 inches calibre), while similar iron was far too soft and extensible. The composition of both is given below, each being abnormal in the presence of so much calcium and magnesium, while normal material in other respects, except as to copper, which is high for the very best grade.

Nos. I. and II. are analyses of Creusot Siemens-Martin iron and steel, given by M. Bobillier in his report "Sur l'Acier a Canons," 1873. No. III. is a sample of Nashua Iron and Steel Co. open-hearth steel, scrap-process; analyst, McCreath. IV. is so-called cast steel without blow-holes, from Terre Noire. V. is a red short ingot-iron, called at one time "Phosphorus steel," from Trenton, N. J. Its red shortness is due to presence of oxides and deficiency of manganese.

Production of Merchantable Products.—The direct products of the processes above described are not, except pig-iron, those in common use. The blooms and slabs of the bloomery, the billets and slabs of the finery, the muck bar of the puddling-furnace, and the ingot of steel, are all intermediate products requiring further work. All may be *hammered* direct into bars; but the usual course is to roll all forms of iron into flat bars about 3 to 8 inches wide, pile these on each other, weld them in a heating furnace, and roll them in powerful trains into various shapes.

For *bar-iron*, bars are used about 2½ to 4 inches wide by ⅝ inch thick, cut up into about 2 to 4 feet long, and the pile made somewhat higher than wide, with its length according to length of bar desired. For special grades of bar, the iron is thus piled and rolled into flat bars from two to three times before final piling. Iron made from bars *thrice* rolled is refined as much as possible, as further piling makes it too *dry*, or too free from cinder and difficult to weld.

The *grades* are in England, ordinary, best, best best, and best best best bars; in this country, refined, best refined, and for higher grades twice or thrice worked, or a special brand, "United States" iron, for instance, four times worked, made during the war by the Wayne Iron-Works, Pittsburgh, for musket-barrels.

For *boiler-plate*, usually twice worked, either from puddled iron (C. No. 1) or from finery charcoal slabs (C. H. No. 1), another method of piling is sometimes used, viz., *cross-piling*, in which some bars are sheared to the width of the pile, which is built of alternate lengthwise and crosswise layers, with the object of securing equal strength in both directions.

For rails the pile is usually 8 or 9 inches high by 7 to 9 inches wide, but is made of *different kinds* of bars, special bars called *tops and bottoms* being made. The top is usually some special hard, cold short iron, fresh puddled, and the bottom a tough iron for the flange as free from red shortness as may be also fresh puddled, so that each may thoroughly weld to the bars between; next these often come bars from old rails, the rest puddled iron. The Reading Railroad made iron rails with tops of thrice-rolled, the rest twice-rolled iron, about the best made in this country. This same method of piling is used for many other kinds of products, and if the article be large, like some I beams, the pile is made the shape of the finished article, but, of course, greatly larger.

The strength of the product depends on the amount of *work* upon it, the greater the reduction of the pile the stronger the bar. Not less than 6 times area of bar is required for good iron; if this is impossible, the work must be put on the bars before final rolling. Mr. Clay, of the Mersey Steel-Works, has shown the effect of *repeated working* by piling and rolling puddled bars, re-piling the bars from each rolling twelve successive times.

		Tenacity.
Original bars		43,904 pounds per square inch.
2d working		52,640 " " " "
3d "		59,584 " " " "
6th "	maximum	61,600 " " " "
9th "		60,480 " " " "
12th "		43,904 " " " "

Col. Wilmot stated that ingots of Bessemer metal exhibited the following improvement from working:

	Tenacity.
Ingot-iron ingots	41,242
Same ingots rolled to large bars	72,613
Same ingots rolled to boiler-plate	68,347
Ingot-steel ingots	68,259
Same ingots hammered or rolled	154,825

Steel is usually hammered direct for best tool-steel, or rolled direct from the ingot for other kinds. The choice between hammer or rolls depends on the quality of the raw material and that of finished product desired, the hammer making the best product from average material, the rolls the cheapest. For steel rails at the Cambria Iron-Works, large ingots (over 2 tons) are rolled in a *reversing-mill* into long bars about 7 inches square, each of which is cut up into 6 to 8 blooms for single rails. Six gross tons of steel (about one charge of the Bessemer vessel) are rolled in 15 minutes or less, and the estimated capacity of the mill is 600 tons of steel reduced from 16½ inches square (average) to 7 inches square in 24 hours. Elsewhere smaller ingots are less advantageously rolled in a *three high blooming-mill*, for 3 to 4 single rails each. Trains of rolls are spoken of as 2 high or 3 high, when two or three rolls are used. In the 3 high train the piece is rolled from back to front as well as to the back only, as in the 2 high train, thus saving the time required to pass the piece back over the top roll. A peculiar 3 high train, known as *Lauth's plate-mill*, uses a small roll opposed to a large one, the former being prevented from breaking by its rolling against the large roll above or below it. This rolls out the plate quicker than two large rolls could, for the same reason that a hammer with narrow dies draws its bars quicker than with wide dies, the latter to some degree *holding* the bar.

The essential rule of *rolling* is that the piece in every groove or pass must be free sidewise. The greater the draft of the pass, the more room must be left at the sides to secure proper extension.

This is especially the case in rolling *wire rod*, where the greatest proportional reductions between successive grooves are applied. A 1½-inch square bar, 12 feet long, is rolled in 17 passes to a rod about 0.17 inch diameter and 175 to 250 feet long in one minute, toward the last being rolled in 2 or 3 passes at once. This rod is rolled on a reel ready for the draw-bench. As an instance of the ductility of iron from the finery forge, it may be mentioned that the St. Engidy and Kindberg Iron and Steel Co. exhibited at Vienna a wire only 0.011 inch diameter in unbroken coils, each 49,310 feet long, drawn with previous rolling from a single bar.

Application of Ingot-iron and Steel.—Cast steel containing less than 0.75 per cent. carbon hardens so little as to be practically useless to the mechanical engineer. Ingot (cast) steel of *good* quality may be chosen as follows, according to percentage of carbon, the steel or iron being low in sulphur and phosphorus:

TOOLS.

Carbon.	
1.5 per cent.	Razor and best lathe tools; very easily burnt.
1.375 "	Saw-file hardness; must be worked below cherry-red.
1.25 "	Turning and planing tools and drills. With skill this grade may be welded with difficulty.
1.125 "	Mill picks, milling tools, and hot sets. Requires great care in welding.
1.00 "	Chisel grade; tough, unhardened, and welded with some difficulty.
0.875 "	Set grade; where, as in smiths' sets and farmers', the soft end of set must stand blow of a heavy hammer.
0.75 "	Die grade; where surface is required hard, the rest tough and able to stand pressure. Also for shear-blades, etc.

STRUCTURAL.

(Principally Bessemer, and Siemens-Martin steel and iron.)

0.65 per cent. (and over.)	Machinery steel for arbors, shafts, springs, etc. Hardens well, but will scarcely weld, being inferior in this respect to cast steel. May be called *very hard* steel considered structurally.
0.55 "	Springs of all kinds, saw-steel, rock-drills, etc. *Hard steel* structurally.
0.45 "	Tires, rails, connecting rods, guides, etc. *Medium hard* or *medium soft* steel. Welds badly and hardens badly.
0.35 "	Ordnance, axles, tires, rails, armor-plate, etc. Welds somewhat more easily than preceding, but hardens very imperfectly. *Soft* or *low steel.* Hardens scarcely at all; welds well.
0.25 "	Rifle-barrels, ordnance, sheet-steel, etc. Formerly called *extra soft steel*, now called *ingot-iron*, or better, *hard* ingot-iron. Does not harden at all, and welds with sand-like iron.
0.10 "	Boiler-plate, rivets, horseshoe nails, and all purposes to which best weld-iron is applicable. *Soft ingot-iron.* Becomes tougher and more ductile when "hardened," and welds readily.

TESTS OF IRON AND STEEL.—Mechanical tests, though quickly made, throw little light on the origin or composition of the metal, unless associated with *Smith* tests of its characteristics. These are tests for red shortness, for cold shortness, for ability to work and weld, for ability to harden, and for ductility, as shown by the angle to which a given bar or plate will bend with or across the grain. This information, combined with the tenacity and elastic limit of the metal, will enable an experienced person to decide very accurately as to the composition and origin of the metal, and Adamson has introduced a "color test," which will enable one to say very nearly how the metal was made. Special experience in this direction can be carried to wonderful perfection. While thorough experience in this department is essential to making reliable products, it is believed that the following notes, indicating the general methods, will afford considerable aid to intelligent criticism. Interference with the manufacturer should at all events have no further scope than an intelligible statement of the objects in view.

When one takes a bar for criticism, a cold fracture is usually the first indication sought. If the bar breaks easily *without nicking*, the metal is very hard steel, or cold short wrought iron. The latter usually shows a crystalline structure of glaring whiteness, while the crystals of the steel will be small, and its color grayish white and mild. If the bar *requires nicking*, it may be a tough, generally red short iron, an ingot-iron, or a medium steel. In this case the fracture will decide between the weld-iron and weld-steel, but not between ingot-iron and ingot-steel; these latter must be separated by their ability to harden and weld, and by ductility, represented by comparative softness under the hammer. If the bar be red short iron, its fracture will generally be of a gray silky color, more or less fibrous according to the toughness of the iron, while the ingot-iron will have a quite coarsely granular structure, gray in color for good metal, and the ingot-steel have a more finely granular structure of similar color (in each case modified by the presence of impurities). Puddled steel can be distinguished by its more or less lamellar structure and frequent presence of spots of iron darker in color than the steel. Blister-steel would be distinguished by its somewhat yellowish color, unusually coarse structure, and its blisters. The above are the usual varieties met with in construction.

The iron or steel may have been overheated and rendered coarsely crystalline with change of color, or red short iron may have been made crystalline by *vibration*, as in a car-axle, or *concussion*, as in an armor-plate. In such cases iron is weak. The origin of the metal will throw light on such exceptions.

If, on *heating* the bar, it will stand a heat so high that sparks fly from its corners on exposure to air, it may be either weld- or ingot-iron. Weld-iron or ordinary piled bars will not *work* with anything like the perfection or soundness of ingot-iron, but it will *weld* with greater soundness, on the average, because it contains cinder. The lowest rail-steel, about the softest steel in the trade, cannot be brought to full iron-welding heat without burning. Steel welds at a lower temperature the harder it is,—that is, the more carbon it contains.

In grading steel, one must bear in mind the exceedingly marked difference in *welding* ability possessed by the different grades and kinds, well exhibited in the table for selection of steel. By observing the *heat* required to weld, the facility with which the bar *welds*, and the *character* of the metal as above described, one can state very exactly the kind of steel in hand and its percentage of carbon.

The best method of ascertaining *red shortness* is that of drawing down at a high heat a flat, thin strip about ½ inch wide by ⅛ inch thick by 9 inches long. Cut it off, reheat to a full yellow, and begin by bending one end at right angles at the high heat, bending, rebending, and hammering down the strip each time on itself, like flattening down an S. Doing this slowly, about 5 bends can be made before the heat is lowered to black heat. The bends being all made at different temperatures will indicate at which, if any, the bar is red short,—that is, tears or cracks while being worked. The degree of cracking will usually indicate the amount of sulphur. If copper and silicon be present in quantity, the break will be *rotten*, and if a large percentage of manganese has been added to counteract these elements, the fatty glance and quite gray color of the cold fracture will indicate this fact.

Cold shortness is very easily determined by attempting to bend a bar about ¾ inch square. If iron, it will not bend to an angle of 90° with its original direction, and if high steel, will scarcely bend at all. The appearance of the fracture will somewhat indicate the cold shortness by the degree of whiteness. The influence of phosphorus is well shown in appended tests on excellent bar-irons, practically identical in every respect, except the amount of phosphorus. All were boiled

from Isabella forge pig, four bars containing 0.22 per cent. phosphorus and four others 0.32 per cent. phosphorus. Those with 0.22 per cent. bent cold to S shape, and were hammered down flat without injury, and three of the four did the same at a nick without breaking, but the fibres tore out to the neutral axis. All those with 0.32 per cent. broke short off at the nick, with crystalline fracture; two broke in the uninjured section before bending 153°, one at 162°, and only one bent 180°. All these tests were made *with* the fibre, and the face of welds parallel to surface bent. Bars containing over 0.65 per cent. phosphorus will not bend to 90°. While no apprehension need be felt in structural use for bars containing 0.3 per cent. phosphorus, yet nothing with over 0.2 per cent. is entitled to be considered first-class soft iron, like the "Ulster" and "Pembroke" brands.

Soft rail-steel with 0.35 to 0.5 per cent. carbon and 0.1 per cent. phosphorus is safe, if otherwise good; with 0.2 per cent., decidedly cold short and unsafe. Tool-steel with more than 0.02 phosphorus is inferior in toughness and ability to keep its edge. A test bar ¾ inch square, from a Bessemer rail, will not bend at all when it has over 0.25 per cent. phosphorus and over 0.25 carbon, and the rails therefrom will be very brittle.

As to *working* or *ductility*, which is of high importance, the smith usually determines it in a test associated with that for red shortness. If a bar about 1 inch wide by ¼ inch thick be slit at the end about an inch in, the ends bent sideways, and inside the bottom of the slit a hole be punched and enlarged till the metal breaks at the slit, the most crucial test for soundness and workability will have been performed. Only the softest ingot-irons and steels of the highest quality will suffer this treatment without tearing in any part. The very best wrought iron will permit the hole to be enlarged till the metal is black-hot, but only the very highest quality, if the bar has been slit.

Another method of ascertaining this quality is to draw down the metal, at proper heat, into the smallest square-tapered rod it will bear without splitting. The best steel will thus draw down almost as fine as a needle, and also allow this tapered point to be flattened down, at a black heat, without injury.

A further measure of ductility is given by the behavior of a small square bar bent cold into an U shape. The ingot-irons and softest steels permit this to be suddenly done with a bar ¾ inch square and the sides hammered close together without injury. Steel of ordinary quality will break, as above, with 0.6 to 0.7 carbon after bending 50°. The angle of flexure seems to be proportional to the amount of carbon, as Greiner asserts. Vickers corroborates this statement, by his tests of best crucible steel, showing that a $\frac{5}{16}$ plate with 1.25 per cent. carbon will break at 38°, while a similar plate with 0.33 per cent. carbon will bend 180° and hammered down flat.

The forge tests prescribed by the British Admiralty are prescribed on a strip 48 inches long with fibre and full width of plate across it. Bends to be made on smooth cast-iron slab with corner rounded to radius of 0.5 inch.

Hot test. All plates 1 inch thick or less must bend hot, without fracture, 125° lengthwise, 90° crosswise for first-class, and 90° lengthwise and 60° crosswise for second-class plates.

Cold test. Plates should bend cold without fracture as follows:

Thick.	1st Class or B. B.		2d Class or B.	
	Lengthwise.	Crosswise.	Lengthwise.	Crosswise.
1″	15°	5°	10°	...
¾	25	10	20	5°
½	35	15	30	10
¼	70	30	55	20
3-16 or under	90	40	75	30

The ability to *harden* is a very striking one. From time immemorial it has been *the* distinctive characteristic of steel, and is its specially valuable property. By their ability to harden the different grades may be distinguished without the least uncertainty. The fracture of two kinds *after* hardening is so different as to be astonishing, although their previous separation by color and grain may have been uncertain.

Weld-iron bars will often be made weak with disintegration of structure when heated nearly white-hot and cooled in brine, because such bars are wanting in homogeneity, containing sometimes steely particles, and always cinder. This exhibition, readily distinguished from hardening by its irregular character and inability to temper, is that property of all weld-iron which prompted Bessemer's question, "Why should it be attempted to stick dirty little granules of iron together, and then squeeze the impure mass until it is so small as to be useless until it is again fagoted up and imperfectly united, and thus forever to multiply the defects which its first treatment entails?"

Ingot-iron is distinctly separated from weld-iron by its crystalline homogeneous structure and the characteristics in hardening described in the nomenclature of this article. It will be noted that the attempt to harden ingot-iron requires the highest temperature the metal will bear. This is because each grade of steel hardens at a temperature decreasing with its percentage of carbon, the hardest steel, like the Mushet and others, obtaining its proper greatest hardness at the darkest red heat. When steel is what is termed *good* the heat at which it is hardened should not exceed low redness. The grade of steel is determined by taking a bar about ½ inch square, nicking it while cold at equal distances, and then so heating it that one end be yellow, while the other is black-hot. In this condition cool suddenly in brine, and the character of the fracture at each neck will indicate the temperature at which the steel hardens best, and consequently, in general, the grade. In the shop this test is often used before working up any new lot of steel, so as to know its proper hardening heat. The proper fracture for hardened steel is an extremely close-grained surface with conchoidal fracture, full white in hard steel, and growing grayer with slightly more open crystalline texture as the steel becomes softer.

When tungsten is present, hardened steel is often tougher than usual; chromium and titanium seem to increase the hardness.

When steel is hardened, and then reheated at

lower temperature, even far below redness, and again suddenly cooled, the original hardness is softened to a degree inversely proportionate to the temperature. The degree of hardness left in the steel is called *temper*. When the scale is taken off with a file, the metallic surface exhibits different colors.

Temperature.	Color.		Use.
	Exact.	Practical.	
430° F.	Pale yellowish.	Straw.	Lancets, razors, etc.
450 "	Pale straw.		
470 "	Full yellow.	Gold.	Penknives, turning tools, etc., where hardness is more important than elasticity.
490 "	Brown.	Chocolate.	Axes, plane-bits, etc.
510 "	Brown with purple spots.		
530 "	Purple.	Purple.	Cutlery, wood tools, etc.
550 "	Bright blue.	Violet.	Swords, cold chisels, light springs, etc.
560 "	Full blue.	Blue.	Augers, saws, stone chisels, springs, etc., where elasticity is more important than hardness.
600 "	Dark blue.		

These great differences in hardness may be applied to testing as a scale to indicate the quality of a sample by its ability to maintain toughness and uniformity of edge and grain, the readiest test being to make a flat cold chisel, temper it, and try it on hard cast iron. The greater the hardness at which it is able to hold its edge the better the steel, and the freer from cold shortness.

When a bar of *ingot-iron* or *steel* is fully heated through to a temperature of 600° (dark blue) in a bath of molten lead, the molecular cohesion of its particles seems to be lessened. When the bar is broken at that temperature, at a nick made when cold, the break will be found differing very greatly from that made cold. The closer the original grain the greater the homogeneity of the fracture, and the higher the temperature at which the steel was made the less the change which occurs in the appearance of the fracture. Cast steel of good quality scarcely changes its appearance at all. The change in Bessemer, open-hearth, and finery steels is very marked indeed, compared with the change in cast steel, each having quite a characteristic fracture. The circumstances of production being generally known, this "color test" will enable one to conclude as to the temperature and method of conducting the respective processes, the amount and influence of silicium and manganese, and hence very closely the manner and often the locality in which the specimen was made.

Another important application of this color test is the distinguishing of the metal best adapted by its chemical composition to resist percussive action between 450° and 600° F. The poorer class of metals with notable amounts of sulphur and phosphorus are simply rotten between these temperatures, although enduring considerable when cold. But it seems clear that the purer the metal is the better will it resist when heated within its elasticity, although weaker when cold than the poorer metal. Great endurance can only be attained by a pure iron as little as possible combined with other elements except carbon. Ordinary iron, though good for cables and tension rods, would be unsafe in a fowling-piece or military rifle, as by quick firing a color heat may be approximately developed, and the barrel be liable to burst. The barrel should not be allowed to become unduly hot in use, but the selection of the metal should be such as to make the endurance of accidental overheating as certain as possible. This consideration applies with force to the selection of ordnance material. The forgings should not be worked at a color heat in any case. This dangerous state frequently occurs in engine fly-wheel shafts and car-axles run dry, and steel forgings are frequently cracked in the journal by water applied to cool them quickly.

MECHANICAL PROPERTIES.

Ordinary Cast Iron.

Property.	Maximum.	Minimum.	Mean.

* Hodgkinson's experiments on Conway Bridge.

The *tenacity* alone does not express the value of the iron; the elongation and reduction of area must also be considered. A very useful comparison is Poncelet's or Mallet's co-efficient, got by multiplying half the breaking weight per square inch, in pounds, by the ultimate elongation, in inches, in one foot of length. This represents the toughness of the material, or perhaps the best criterion is the ratio of the elastic limit to the tenacity.

The Neuberg Bessemer classification was worked up by the direction of the Imperial Works at Neuberg, on specimens cut from rolled bars about one inch square. For ordinary purposes they separate the grades thus: VII., 57,390 pounds to 68,868 pounds; VI., 68,868 pounds to 80,346 pounds; V., 80,346 pounds to 103,302 pounds; IV., 103,302 pounds to 126,258 pounds; III., 126,258 pounds to 149,214 pounds. Nos. II. and I. are rarely made. The table for crucible steels was prepared by Mr. Thos. E. Vickers from steel of the River Don Works, on test bars with turned section 1 inch diameter, uniform for 14 inches. The bar marked * was slightly defective.

The Carlsdal tests were made for the Royal Railway Commission of Sweden, on rolled bars from that works, and reported by Knut Styffe. Besides corroborating the others they show how steel decreases in strength on passing 1.17 to 1.25 per cent. carbon, its maximum point of tenacity. The Carlsdal steel contained 0.023 per cent. phosphorus.

These general results may be safely taken as a guide. They were independently prepared by careful men, and are corroborated further by their agreement with the results of Seraing steel (Dürre), of Fagersta steel and iron (Kirkally), and the general published results on similar metal. It will be remembered that when specimens are tested for limit of elasticity, they give a lower tenacity (Carlsdal) than when broken at once for tenacity (Neuberg).

The first four sets of tests were made at the Royal Gun-Factories, Woolwich, for ordnance. The last set was made by W. H. Shock, U.S.N., on steel for St. Louis Bridge experiments; all his specimens were from the same bar, all heated to a light cherry-red. The specimens hardened in water were tested at their maximum hardness; those tempered were drawn to a *plum-blue.*

The Woolwich specimens were short cylinders 0.5 inch diameter, and 2.0 inch long between shoulders; those of Mr. Shock were 0.62 inch diameter at the bottom of a circular notch cut in at the middle of breaking cylinder.

ORDNANCE CAST IRON.

English.

Property.	Max.	Min.	Mean.

Specific gravity	7.340	6.822	7.140

The gun-metal (iron) of the Bowling Iron Co. was 7.233, with tenacity of 27,838, and transverse strength 10,095 pounds, and from a gun-head resp. 7.233, 26,896, and 9386 pounds. These figures are mean results from the experiments on 850 samples of metal for cannon at Woolwich, 1858. The form of specimens and machine itself were exactly similar to the Wade machine and specimens of Ordnance Department, U.S.A.

The gun-iron used in the United States will be best described by referring to the trial cylinders for the first 15-inch Rodman gun cast at Fort Pitt Foundry in 1859, and for the 12.25″ Palliser rifle-casing cast in 1877 at South Boston Foundry.

The 15-inch trial cylinder was of Bloomfield pig-iron, while the other was of Dover and Muirkirk irons.

General Uchatius has determined the absolute and the elastic strength of Austrian gun-iron brought into *tension* by blows of a falling weight. Although the small size of the specimens probably affects the result unfavorably, they are, nevertheless, important. The specimens had the form of a cylinder with two conical ends broadening outwards, the area was 0.5 square centimetre, the length 75 millimetres, and the falling weight 1.15 kilogramme. I have added a comparison in foot-pounds.

Gun-Iron Tenacity under Shock.

Weight, 2.5353 pounds. Specimen, 0.0775 square inch area × 2.95 inches long.

Fall in Inches.	Foot-Pounds.	Blows received before Fracture.	Foot-Pounds per Square Inch.	Ratios.
28.346	5.9833	1	77.202	24
24.803	5.2353	2	67.551	21
21.261	4.4874	4	57.900	18

14.173	2.9916	14	38.600	12
10.630	2.2437	37	28.950	9
7.086	1.4958	352	19.300	6
3.543	0.7479	2052	9.650	3
1.181	0.2484	elast. limit.	3.205	1

The toughness of gun-iron has been compared with that of ordinary cast iron by Mr. F. Alger for the South Boston Iron Company. The test was made with a 50 pound falling weight striking the centre of a bar of 4 square inches area lying on supports 20 inches apart. Both the striking and the supporting edges were rounded to ½ inch radius.

	Best Ordinary Cupola Iron.	Gun-Iron from Air Furnace.
Transverse strength	5,220	9,630
Specific gravity	7.0419	7.2916
Tenacity	15,542	33,334
Number of blows (50 foot-pounds) before fracture	9.44	463.0
Greatest number blows	18	563
Least number blows	2	358
Number of experiments	24	6

That this represents most wonderful toughness need not be enlarged upon. Some tests showed that gun-iron melted in the cupola stood 234 similar blows as the average of 5 experiments. This relation between the two kinds is partly corroborated by the test of 5 guns made at Bank Quay by Mr. Fairbairn, and proved at Woolwich in 1855. From an identical mixture the air-furnace gun withstood 33 rounds, the cupola gun only 17 rounds before bursting; the average respective densities were 7.210 and 7.081, and tenacities 28,515 and 18,100.

An inference from these facts may be that a homogeneous gun subjected to a charge which strains it to 3 times its elastic limit will endure more than 2000 rounds. But if strained to 24 times its elastic limit under shock it will burst at the first fire.

Kaiser, in his work on "Theorie der Elasticität und Festigkeit röhrenförmiger Körper," gives an important table of comparative elastic resistances of hollow cylinders. It shows the inadvisability of exceeding one calibre thickness of wall in homogeneous guns. Above 1 calibre the addition of 40.6 per cent. (1.25 cal.) to weight adds only 4.5 per cent. to the strength. He takes the following limits of elasticity:

A. Ordinary gun bronze..................	11,379 pounds.
B. Gun-iron, Mariazell, Austria...........	15,646 "
C. "Steel bronze"............................	34,136 "
D. Neuberg refined Bessemer for cannon..	35,558 "
E. Krupp steel for cannon.................	38,403 "

I. Gun- (cast) iron. Specimen from the experimental cylinder for 12.″25 experimental ML. rifle, of which average tenacity when cast was 36,089 pounds per square inch, and specific gravity 7.2979, as average of 7 specimens from the gun-head.

II. Sample was from a bar of Ridsdale weld-iron, 3.″75 × 2.″625 × 2″, with the fibre. The averages of this iron for 4 tests are, specific gravity, 7.6660; tenacity, 53,110; elastic limit, 22,375 pounds per square inch.

III. Specimen of mild crucible steel from Bochum; averaged in 3 other tests, specific gravity, 7.8687; tenacity, 73,000; elastic limit, 24,333 pounds per square inch. A similar tube, of specific gravity 7.8945 and tenacity 88,019 pounds, cracked through from vent to muzzle in an 8-inch converted rifle at 175th round, the cast-iron casing sustaining 286 full rounds further till it burst at 456th round. At 3 feet from bottom 2 tests indicated an average of 7.8531, and 78,664 pounds for the ruptured tube.

IV. Whitworth Fluid Compressed Steel. When broken for tenacity *only* its strength was 110,000 pounds per square inch. Its mean mechanical properties are, tenacity, 86,000 pounds; elastic limit, 38,500 pounds; ultimate elongation, 0.″1750; elastic elongation, 0.″0023 per inch. Both III. and IV. were large forgings.

All figures for hardness refer to a scale in which copper is 5.

The "Prussian Ordnance Manual," edition 1877, gives determinations of the Royal Ordnance Foundry of the strength of "Krupp's Steel for Cannon," as follows: tenacity, 74,655 pounds; elastic limit, in tension, 28,440 pounds, in compression, 28,440 pounds; compressive strength, 241,740 pounds per square inch.

—*John B. Pearse, Manager South Boston Iron-Works.*

Iron, Angle-. Various angular forms of rolled iron, much used in bridge-construction for girders, beams, rails, etc., and for staying the flat sides of rectangular boilers.

Iron-bound Blocks. Those which are fitted with iron straps.

Iron-bound Coast. A coast where the shores are composed of rocks which mostly rise perpendicularly from the sea, and, having no anchorage near to them, are therefore dangerous for vessels.

Ironclads. The term applies to all vessels clad with iron for defense. The introduction of iron armor for the protection of ships is of very recent date. Formerly, as we find by allusions in history, there had been instances where efforts were made to protect the sides of ships by timber or hides, but these seem to have been isolated cases due to the ideas of some individual commander. With the artillery that was in use in the 15th, 16th, and 17th centuries there was no call for any aid in the defense of ships, and the term "wooden walls" conveyed the idea of an all-sufficient protection; and the correctness of the idea is sufficiently apparent when we refer to the actions of such commanders as Blake and Van Tromp being continued day after day, and being finally closed without definite result.

In the 18th century artillery had become much more formidable, but it was not until early in the 19th century that any definite shape was given to the idea of protecting the sides of a ship from the fire of an enemy; and even when it was first seriously proposed it met with great disfavor, and has had to fight its way against determined opposition and prejudice.

Thomas Gregg, of Pennsylvania, is given the credit of the first definite proposition for an ironclad vessel in 1813, but no decided step in developing the subject was taken until Mr. Stevens, of New York, made his contract with the U. S. government in 1843 for the construction of an armed vessel.

The date of this, the first decided step in the direction of armor for ships made by any government, is worthy of note, for we find that it was at about the same period of time that horizontal firing of explosive projectiles from the batteries of ships of war became general. The connection between the two circumstances is apparent, and there can be no doubt that the introduction of the shell as a projectile has caused the use of iron for armor.

The development of armor ceased at this time with the above contract for the Stevens battery, and it was not until after the Crimean war (1855) that efforts were renewed to introduce armor.

During the Crimean war a few ironclad batteries had been constructed by the French, and it was the behavior of these vessels in their ability to resist the effect of shells which induced the English and French governments to commence the construction of ironclad ships. In 1858 the work of conversion and construction was commenced in earnest, and it has been carried on unremittingly to the present day. As the capacity for defense increased, the power of offense was added to by increasing the power of the guns, and thus have arisen the wonderful fleets of ironclads that we now see on the ocean.

The different types of ironclads are so numerous that it is impossible to enumerate them in a paper of this character; they can be generally ranged under two heads, namely, as broadside and turreted vessels. The first efforts were naturally confined to the construction of broadside ironclads; the turreted vessels were of later date of construction, due to an invention of Mr. Ericsson, of which mention will be made later. The broadside ironclads will be first presented, and the rate of development during the past twenty years can be estimated by citing a few instances in the course of the application of the system. The work of developing the system was assumed by England and France alone, and after a certain point had been reached England was left alone to continue the work, carrying it to its present state. The conclusions that have been reached by her investigations and experiments have been adopted and applied by other nations, but the English ironclads are the proper citations to make in tracing the advancement of the system.

In 1858 the French built "La Gloire," and the English built the "Warrior." The "Gloire" was a wooden hull, but the "Warrior" was iron built. This error in the French construction was continued for many years, and had the effect of throwing her back in the struggle for supremacy, as the deterioration of the wood covered by iron-plating made repairs frequent, and increased expense.

The following table presents the first experiments made in the development of sea-going broadside ironclads:

Name of Ship.	Length in feet.	Beam in feet.	Displacement in tons.	Draft forward in feet and inches.	Draft aft in feet and inches.	Thickness of Armor at Water-line, in inches.
Warrior	380	58	9681	25.6	26.5	4½
Gloire	252	56	5530	23.1	27.10	4.72

The "Gloire" carried a battery of thirty-six 6-inch guns, but the "Warrior" carried a battery of ten 12-ton (9-inch) and sixteen 6½-ton (7-inch) guns, which made her much the more formidable vessel.

After the construction of these vessels the mode of procedure of the two governments was very unlike, the French plan being to build a large number of similar vessels, while the English plan is apparent in numerous vessels of dissimilar construction. Two examples are cited of a type that has been repeated very often in the French service, thus forming the chief part of her ironclad fleet.

Name of Ship.	Length in feet.	Beam in feet.	Displacement in tons.	Draft forward in feet and inches.	Draft aft in feet and inches.	Thickness of Armor at Water-line, in inches.
Flandre	259	56	5703	23.6½	26.10	5.9
Belliqueuse	230	46	3675	18.10	23.9	6

The class of the "Flandre" type is armed with eight 12-ton guns and four 7-ton guns. The class of the "Belliqueuse" type is armed with six 7-ton guns.

The following examples (taken, as are the above, from King's "Report on European Ships of War") illustrate the progress made in England in the development of ironclads of the broadside type:

Name of Ship.	Length in feet.	Beam in feet.	Displacement in tons.	Draft forward in feet and inches.	Draft aft in feet and inches.	Thickness of Armor at Water-line, in inches.
Agincourt	400	59	10,395	26.0	27 0	5½
Bellerophon	300	56	7,540	21.0	26 0	6
Iron Duke	280	54	6,034	22.0	23.0	8 to 6
Hercules	325	59	8,700	23.0	26.5	9 to 3
Nelson	280	60	7,323	24.2	24.2	9
Alexandra	325	64	9,492	26.0	26.6	12 to 8

Since the time of the completion of the "Warrior" there has taken place a great change in the way of disposing the armor, and this has been influenced by the change in the artillery, which concentrates a greater power now in a few guns than was developed in the "Warrior's" armament by a larger number of guns. The "Warrior" was armored amidships only,—that is, abreast of her battery; the ends were unprotected. In later constructions a continuous belt of armor is considered indispensable all around at the water-line, and the side-armor is carried up around the more contracted space devoted to the battery. In some cases, notably in the "Nelson" type, the broadside of the battery is left unprotected, the amount of armor that would have been placed at that place being disposed in the form of vertical bulkheads and horizontal decks forward and abaft of the battery; all the vital portions of the vessel are thus amply protected, and the battery itself is protected from a fire from directly ahead or astern.

It has always been very desirable to give the guns as much lateral train as possible, but when the guns, few in number, were concentrated in the central part of the vessel, it became the more necessary to increase this property in them. From the effort to achieve this object have arisen many of the modifications in the development of the fleet of ironclads, which account for the diversity in their construction. In some cases the forward and after iron bulkheads are curved to form bow and quarter ports, in which guns are mounted and protected even when the broadside battery is unprotected. In other cases, where the broadside battery is protected, and the side-armor is connected with the athwartship bulkheads forward and abaft the battery, a port is cut in the bulkheads near the corners, and the forward and after guns on each side are made "shifting guns," to fire out of either port at will. In other cases, an additional iron casemate is constructed above the main battery. In other cases, the fire ahead and astern is delivered from stationary turrets placed at the bow and stern, the guns being uncovered, mounted in barbette. By these means an all-around fire is obtained from broadside ships without interfering with the use of the whole battery on the broadside.

The introduction of turreted ironclads is due to a call for ironclads made by the U. S. government during the war of the Rebellion of 1861. Among those who responded to this call was Mr. John Ericsson, of New York, who submitted the plans of the "Monitor."

Agreeably to the conditions named by the Navy Department, the following problem was presented to him: an ironclad vessel of small dimensions capable of navigating the Southern rivers, and absolutely impregnable against the ordnance possessed by the Southern States.

The draft of water being thus limited to about 11 feet, impregnability could only be insured by nearly immersing the hull, as high freeboard and impregnability would have called for an amount of weight incompatible with light draft and small tonnage.

Absolute protection to guns and guns' crews being also an imperative condition, called for the adoption of a covered battery, which was made cylindrical, and, in order to obviate the necessity of manœuvring the vessel in narrow rivers, the battery or turret was made to revolve around a vertical axis, in order to insure an all-around fire while the vessel remained stationary.

As the light draft of this small ironclad brought the top of the propeller very near the water-line, a projecting deck, or stern-overhang,

was adopted for the protection of the propeller-blades.

The principal object of the "Monitor" being that of engaging shore-batteries at short ranges, facilities for dropping and lifting the anchor without exposing the crew also presented a problem for solution, hence the adoption of the overhang-deck at the bow, provided with a cylindrical well in which the anchor was suspended after being lifted by mechanism arranged within the hull. In order to give thorough protection, the steam machinery, as well as the quarters for officers and men, were located below the water-line, and further protected by a continuous side-overhang. This consisted of the armor and wood backing, first styled "armor timber," which was bolted to the iron hull, being supported by a horizontal girder running all along the side, called an "armor shelf," which was assisted by vertical gussets of iron secured at intervals to the side by angle-irons. The wood backing was disposed in two layers between these gussets, and the armor, consisting of five 1-inch plates, was bolted on outside of all. The armor shelf, disposed as a horizontal girder, formed the base of this projection from the side, and presented a very formidable resistance to any inclination or tendency to roll that might be induced by the action of the waves. The whole structure was like a raft on the water, and this was the original design as conceived by the inventor. It was a most perfect gunnery platform. The guns that were mounted on this vessel had to be inclosed, and the most convenient form of inclosure was circular; this was arranged so as to give lateral training to the guns by revolving, and thus we have the origin of the system of revolving turrets for ironclad vessels.

The principle of the Ericsson turret, with modifications in the plan of revolving it, has been adopted by other nations, notably by England, and is perpetuated in her large fleet of turreted vessels, but a decided departure is taken in their construction from the original design of the "Monitor." In fact, it is a misnomer to style all turreted vessels monitors, for they are only such in the one point of common resemblance, that the battery is inclosed in a turret. With the heavy guns now in use a turret is necessary for the manipulation of them, but in the "Monitor" the turret was adopted as a convenience, for the guns that were mounted in the "Monitor" (11-inch Dahlgrens) could be worked by man-power. The turret was not the only principle involved in the "Monitor:" the low freeboard was quite as essential a feature; thus the foreign turreted vessels, with their high freeboards and breastworks and curved bottoms, inducing and favoring the rolling motion, do not embody the idea of the "Monitor."

By common, tacit consent of nations, turreted vessels are not supplied with masts and sails. The experiment was tried in England, where were built the "Monarch" and the "Captain"; both of these vessels had comparatively high freeboards, that of the "Monarch" being 8 feet in height. The "Monarch" has not been duplicated, and the "Captain" capsized under sail and foundered during her first experimental cruise. The effort in these vessels was to raise the turret-ports higher above the water; this was done by raising all the weights and building up the armored sides to the required height. The effect of this plan was demonstrated in the melancholy catastrophe that befell the "Captain." The same result, so far as raising the ports higher is concerned, is achieved now by the English Admiralty in their turreted vessels of later date by building, on a deck of low freeboard, a breastwork which protects the lower portions of the turrets and smoke-stacks, and affords a shelter to the hatchways from water that may come on deck. The breastwork-turreted vessels carry two turrets, and the space inclosed by the breastworks occupies a large portion of the length of the vessel, consequently this provides a large surface to resist the wash of seas that find their way over the rail on to the deck, and thus a rolling motion is induced which does not obtain in the Ericsson monitor. The rail itself of the breastwork-turreted vessels is much higher than in the monitor as designed, and every inch of height of freeboard increases this tendency to roll to a great degree.

There is one point about the breastwork-turreted vessel which is referred to as a great advantage, but which is more imaginary than real; it is that the breastwork affords a protection to the hatchways, which can be left open when the seas are flowing across the deck, and thus allows natural ventilation to the ship. Carefully-prepared statistics, gathered from the experience of the Ericsson monitors during the war of the Rebellion, show that the health of the crews of the monitors was better than that of the crews of the rest of the blockading squadrons. The artificial ventilation of the monitors, effected by centrifugal suction-blowers operated by steam, is thus proved to be all-sufficient.

In comparing the original design of the "Monitor" with the turreted vessels of other nations, we find that for harbor defense the monitor is the more steady gunnery platform, but for service at sea the breastwork-turreted vessel is the more efficient.

Besides England, the only nations in Europe that have adopted the turret system to any extent are Holland and Italy. The Russian navy is provided with a few monitors of the "Passaic" class. The following tables present examples of turreted vessels in the navies of the three nations who have adopted the system in whole or in part.

The fighting force of the Dutch navy is composed entirely of turreted vessels. They are designed for harbor defense, and are considered of sufficient power to cope with such vessels of an enemy as have light draft sufficient to enable them to approach a shallow coast.

Name of Ship.	Length in feet.	Beam in feet.	Battery.	Draft forward in feet and inches.	Draft aft in feet and inches.	Thickness of Armor at Water-line, in inches.
Cerberus......	187	44	Two 12-ton guns	8.6	8.6	5½
Scorpion......	193	36	Two 9-inch guns	15.6	15.6	6
Buffel.........	205	40	Two 9-inch guns	15.6	15.6	8¼
Prince Hendrik.........	230	44	Four 9-inch guns	17.10	18.10	5¾

The following are examples taken from the list of English turreted vessels:

Name of Ship.	Length in feet.	Beam in feet.	Displacement in tons.	Draft forward in feet and inches.	Draft aft in feet and inches.	Thickness of Armor at Water-line, in inches.
Viper	160	32	1,220	10.8	11.7½	4½
Scorpion	224	42	2,777	16.11	16.2	4½
Gorgon	225	45	3,430	16.5	16.5	10 to 6
Glatton	245	54	4,912	19.0	19.0	14 to 12
Ajax	260	66	8,492	23.0	24.0	18
Thunderer	285	62	9,190	26.2	26.3	14 to 12
Inflexible	320	75	11,500	23.3	25.4	24 to 16

The broadside ironclads of Italy are armored with iron of from 4½ to 6 inches, but in the development of the turret system they have taken a step in advance of the rest of the world. The following table cites the latest efforts of Italy in this respect:

Name of Ship.	Length in feet.	Beam in feet.	Displacement in tons.	Draft forward in feet and inches.	Draft aft in feet and inches.	Thickness of Armor at Water-line, in inches.
Duilio	340	65	10,650	25.5	26.5	22
Dandolo	340	65	10,650	25.5	26.5	22
Italia	400	74	13,480	25.4	30.4	36
Lepanto	400	74	13,480	25.4	30.4	36

These vessels are armed with four 100-ton Armstrong guns. The central portion of these vessels is plated with steel instead of iron, in consequence of the result of experiments made with the 100-ton gun against targets constructed on different systems of steel and iron.

In reference to the weight of the guns that can be carried by vessels of the broadside and turreted systems, respectively, it is shown that it has not been attempted to work a heavier piece than a 25-ton gun in a broadside battery, while we see that the armament of the "Duilio" (turreted vessel) consists of 100-ton guns. So far, then, as capacity to manipulate the heavier gun is concerned, the turreted vessel has the advantage over broadside ironclads.

The necessity of providing ironclad vessels with capacity to float the increased weight due to their armor has forced great changes in naval architecture. The V-shaped cross-section of the "Warrior" has given place to one of a U form, and a comparison of the dimensions of the lightly-armored "Warrior" with the heavily-armored "Alexandra" show the modifications that have been introduced in this respect. The graceful overhanging bows have been suppressed, and the sterns are designed so as to afford protection to the screw and rudder.

So great is the thickness of plates that have now been called into use in consequence of the development of power in guns, that efforts are being made to utilize other metals than iron in hope of reducing the weight of the armor while retaining power of resistance to impact. It has been mentioned above that steel is being used for the plates of the Italian turreted vessels, and it has also been discovered that an iron plate faced with steel, by welding when the steel is in a liquid state, increases the power of resistance to a great degree. It is probable that the latter plan will be very generally adopted for the armor of ironclads.—*E. Simpson*, *Commodore U.S.N.*

Iron Garters. A cant word for leg-irons.

Iron-horse. The horse of the fore-sheet or boom-sheet traveler.

Iron-rust Cement. A cement sometimes used in soft-patching boilers; it is composed of iron borings or filings, sal-ammoniac, and white lead, with sometimes a little sulphur, the object being to form a solid rust.

Irons. The wedge-shaped tools used by calkers. The fetters used to confine a prisoner. A ship is *in irons* when, owing to her bad working qualities or to mismanagement, she, in the operation of tacking, comes up head to the wind, and loses her way, lying dead in the water. If she gathers sternway she may be made to fall off the right way by shifting the helm; the long ships of the present day very seldom go around without getting sternway on. To fill the sails on the same tack, the mainsail and spanker are taken in, the after-yards are squared, and, if necessary, the head-yards are braced abox.

Iron-sick. The condition of vessels when the iron-work becomes loose in the timbers from corrosion by gallic acid.

Ironsides. A sobriquet for a favorite veteran man-of-war. The famous frigate "Constitution" was familiarly known as "Old Ironsides."

Iron Vessel. A vessel in which the keel, stem and stern-posts, keelsons, frames, stringers, deck-beams, stanchions, knees, stern and breast-hooks, bulkheads, fastenings, etc., and the outside covering or skin, are of iron. The lower masts are frequently made of iron, and sometimes other heavy spars. The decks are of wood, or sheathed with wood; some parts of the interior are ceiled with the same material, and some light bulkheads and "joiner-work" are also of wood. In some iron vessels of war the bottom of the hull is covered outside the iron skin with wooden planking, which is sheathed with copper to a short distance above the load water-line. This is done to protect the iron and prevent fouling of the bottom by grass, barnacles, etc. Vessels having iron frames and the outer skin made of planks bolted directly to the frames without the intervention of an iron skin are called *composite.* This method is advocated for parts of unarmored vessels of war that are exposed to shot, in order to avoid the well-known evil effects of shot passing through thin iron plates. Iron vessels are lighter, stronger, and far more durable than wooden ones, which they are rapidly superseding.

The principal cause of deterioration of iron vessels is the corrosion of inaccessible parts of the interior; but if these parts are thoroughly covered with asphalt, paint, or cement while building, corrosion does not occur to a serious extent. It is necessary to prevent all contact of copper with the iron.

Iron-work. A general name for all pieces of

iron, of whatever figure or size, which are used in the construction and equipment of ships.

Irradiation (Lat. *irradiare*, to cast forth beams upon). The apparent enlargement of the disk of a heavenly body, caused by the vivid impression of its light on the eye. This phenomenon is perhaps best illustrated by the appearance of the new moon; the slender, bright crescent appears to the eye to be a portion of a larger circle than the part of the disk which is visible in the shade. The effect of irradiation on the apparent diameter of the sun may amount to as much as 6″, but so small a quantity as this is of no practical importance. It may, however, be removed by observing both limbs.

Islands. An island is a tract of land surrounded by water. From this definition are, however, excluded the great continents, Eastern and Western, and Australia. The seas of the globe are dotted with islands, and their number is legion. An islet is a diminutive island, and a still smaller spot at the surface of the sea is known as a reef. For the most part islands are collected together in *groups*, and large collections of islands in one locality give it the name of archipelago, a name originally applied to the *chief sea* of the Greeks, full of islands. We have also the Farsan and Dhalæ Archipelagoes in the Red Sea, the Low Archipelago in the Pacific, and the Mahe Archipelago in the Indian Ocean. An abundance of islands has given a name to a certain quarter of the globe,—Polynesia, "many islands." The least number of islands is found in the Black Sea, of all the large sheets of water, there being no more than half a dozen small islands in it near the coast of Turkey. The Dead Sea has no islands, but most inland sheets of water have several.

Many islands are volcanic in origin, whole groups in the Pacific being formed on the craters of extinct volcanoes, and on many, active volcanoes exist, as in the well-known Lipari Islands. Others have been thrown up by earthquakes, and many have disappeared in like convulsions. Other islands have been formed, or their size increased, by the alluvium brought down by rivers, or by the drifting sands brought by ocean currents in shallow waters. Numbers of islands owe their origin to the labors of marine animals, the coral islands of the Pacific embracing nearly all of the groups. Such islands are *atolls*, with circular lagoons in their centres, *barrier reefs* or *fringing reefs*, the former gradually sinking, the latter rising from the surface of the water. Many islands have been artificially made—as on the coast of Holland—by the formation of canals. The great rivers of the world contain many islands, some of considerable size. On many islands are situated cities of greater or less size, notably New York, London, Edinburgh, Dublin, Venice, Palermo, Aden, Bombay, Yeddo, Hong-Kong, etc. By far the greater part of the islands of the world are inhabited, and at least two of the great kingdoms of the world, Great Britain and Japan, are island empires. The largest island in the world is Borneo, containing 260,000 square miles, while Nova Zembla, Iceland, Great Britain, Ireland, Corsica, Sardinia, Sicily, Ceylon, Sumatra, Java, Luzon, Celebes, Mindanao, Hainan, Formosa, Kiu-Siu, Nippon, Yesso, Saghalien, Papua, Tasmania, New Zealand, Vancouver's, Tierra del Fuego, Marajo, Hayti, Cuba, Newfoundland, and Madagascar are among the largest in the world. Many islands are remarkable for their products, some for fisheries, as Newfoundland; some for seals and walrus, as the Aleutian Islands; for cotton, as the islands on the southern coast of the United States; for coral, as Corsica; for pearls, as the Bahrein Islands, in the Persian Gulf, and the Pearl Islands, in the Caribbean Sea; for fertilizing phosphates, as the Guano and Chincha Islands, on the Peruvian coasts, and for many other valuable products.

The Atlantic contains few islands in mid-ocean. The Madeira, Azores, Bermuda, Ascension, St. Helena, St. Paul's, Martin Vaz, and Tristan d'Acunha are the principal ones. But near its shores are situated many of the more important islands of the globe. The Mediterranean contains many large and important islands scattered about its basin. The Arctic Ocean contains many islands, some of them being of great size, but few are found in the Antarctic waters. The Indian Ocean contains several large islands, and many important groups. The Pacific Ocean contains by far the larger portion of the islands of the globe, both in size and number. Many of its large islands have been enumerated. Chief among its groups are the Kiu-Shiu, Japan, Loochoo, Aleutian, Sandwich, Galapagos, Paumoto, Marquesas, Society, Friendly, Cook's, Austral, Fiji, Samoan, Union, Ellice, Phœnix, Gilbert, Marshall, Caroline, Ladrone, Philippine, Celebes, Moluccas, Kermadac and Chatham, and New Caledonia and New Hebrides.

Islands are important to the navigator, forming a haven in storms and shipwreck, being important stations for supplies, often serving as bases for light-houses, and centres for maritime operations in war. They will prove important as coaling stations for future steam fleets, even when otherwise useless.—*F. S. Bassett, Lieutenant U.S.N.*

Island Harbor. One which is protected from the violence of the sea by one or more islands or islets screening its mouth.

Island of Ice. A name given to a great quantity of ice collected into one solid mass and floating upon the sea; they are often met with on the coast of Spitzbergen, to the great danger of the shipping employed in the Greenland fishery.

Islands of the Blessed. According to an old Greek myth, certain happy isles in the Western Ocean where the favorites of the gods, rescued from death, dwelt in joy.

Isle of Wight Parson (*Eng.*). A cormorant.

Islet, or Islot. An insular spot smaller than an island, yet larger than a key.

Isthmus. A narrow neck of land which joins a peninsula to its continent, or two islands together, or two peninsulas, without reference to size. The Isthmus of Suez alone prevents Africa from being an island, as that of Darien connects North and South America.

Italy, Navy of. This kingdom was never able to boast of a very large navy until the abolition of the Austrian power in Lombardy and the removal of the territorial rule of the Pope expanded the monarchy of Sardinia to the sovereignty of all Italy. A considerable maritime force is now maintained and is still on the increase. At the end of December, 1879, it consisted of 86 steamers,

armed with 676 guns, 16 of which vessels were armor-clad. Two of the first-class ironclads alone had 7500 horse-power each, and carried four 100-ton guns. Moreover, they were double-turreted and considered the most powerful types of men-of-war ever constructed. Yet two more ironclads are on the stocks, and they will each be of 14,000 tons, carrying guns and horse-power in proportion. In 1879 the Italian navy was manned by 11,200 sailors and 660 engineers and workingmen, with 1271 officers, including 1 admiral, 2 vice- and 10 rear-admirals, and 83 captains. The marine-service is comprised in 2 regiments of 205 officers and 2700 soldiers.

Iurram. A Gaelic word signifying a boat-song, intended to regulate the stroke of the oars. Also, a song sung during any kind of work.

Ivigar. A name for the sea-urchin, *Echinus marinus*.

Ivory Gull, or Snow-bird. The *Larus eburneus* of Arctic seas. It has a yellowish beak, jet-black legs, and plumage of a dazzling white.

J.

Jab. A peculiar net used in catching the fry of the coal-fish.

Jack. A flag corresponding in appearance to the union of the national flag. Thus, in our service it is a blue flag containing a star for each State. It is hoisted at the jack-staff shipped at the bowsprit-cap when in port, with topgallant yards across. An athwartship bar of iron at the topgallant mast-head, to give spread to the royal shrouds. A popular name for a sailor. A young male pike. A portable machine for moving great weights or resistances slowly or through a small space, by human force exerted rapidly or through a great space. Its principle of action may be either that of a lever, a rack and pinion, a screw, or a hydraulic press.

Jack Afloat. A popular name for a sailor.

Jackass. A heavy rough boat used in Newfoundland. A canvas bag stuffed with oakum, used for making the hawse-holes water-tight when the chains are bent.

Jackass Frigate. A vessel between a frigate and a sloop-of-war, carrying a whole tier of guns on a covered deck and a few on the quarter-deck and forecastle.

Jackass Penguin. A name given to the penguin on account of its stupidity, and its peculiar cry somewhat resembling the braying of an ass.

Jack-block. A block under the eyes of the rigging for the topgallant or royal yard-rope, used in sending the light masts and yards up and down. It obviates the necessity of reeving or unreeving the yard-rope during the operation.

Jack Cross-trees. An athwartship iron bar at the topgallant mast-head, to give spread to the royal shrouds. It is usually called a *jack*.

Jackee-ja. A Greenland canoe.

Jacket. A close-fitting outer garment extending downward to the hips. An envelope or covering of heat non-conducting properties, used to prevent radiation of heat from a body, such as a steam-boiler, cylinder, chimney, etc. An annular space surrounding the cylinder of a steam-engine containing live-steam or hot gases, to prevent initial condensation when working steam expansively. A casing used to confine separate parts of material together.

Jack-hern. A name for the heron.

Jacking. Taking the skin off a seal.

Jack in the Basket. A sort of wooden cap or basket on the top of a pole, to mark a sand-bank or hidden danger.

Jack in the Box. A very handy engine, consisting of a large wooden male screw turning in a female one, which forms the upper part of a strong wooden box, shaped like the frustum of a pyramid. It is used by means of levers passing through holes in it as a press in packing, and for other purposes.

Jack-knife. A horn-handled clasp-knife with a laniard, worn by seamen.

Jack Nasty-face. A cook's assistant.

Jack of Dover. An old sea-dish, the composition of which is now lost.

Jack O' Lantern. The *corpo santo*, or St. Elmo's light, is sometimes so called.

Jack-o'-the-dust. The assistant of the paymaster's yeoman.

Jack-pins (*Eng.*). A name applied to the fife-rail pins.

Jack's Alive. A once popular seaport dance.

Jack-shark. A common sobriquet of the *Squalus* tribe.

Jack-sharp. A small fresh-water fish, otherwise known as *prickly-back*.

Jack's Quarter-deck. The topgallant forecastle.

Jack-staff. A short staff raised at the bowsprit-cap, upon which the jack is hoisted.

Jackstay. A rope or rod of iron running along a mast, yard, the water-ways, etc., and serving as a traveler, as a means of attaching a sail to its yard, etc.

Jack Tar. A popular name for a sailor.

Jacob's Ladder. The assemblages of shakes and short fractures, rising one above another, in a defective spar. Also, a short ladder with wooden rungs and rope sides for getting into the lower rigging, or up to the jack.

Jacob's Staff, or Cross-staff. A mathematical instrument to take altitudes, consisting of a brass circle, divided into four equal parts by two lines cutting each other in the centre; at each extremity of either line is fixed a sight perpendicularly over the lines, with holes below each slit for the better discovery of distant objects. The cross is mounted on a staff or stand for use. Sometimes, instead of four sights, there are eight.

Jaculator. A fish whose chief sustenance is

flies, which it secures by shooting a drop of water at them from its mouth.

Jag. To notch an edge irregularly.

JAGGED. A term applied to denticulated edges, as in jagged bolts to prevent their coming out.

Jagara, or Joggaree. A coarse brown sugar of India.

Jalias. Small craft on the Arracan and Pegu coasts.

Jam. To confine by pressing against; to render immovable. Generally applied to running-gear when it will not render through the blocks. Figuratively, to involve in a difficulty from which there is no escape.

Jamaica Discipline. The buccaneer regulations respecting prize shares, requiring that all prizes be divided among the captors.

Jangada. A sort of fishing float, or rather raft, composed of three or four long pieces of wood lashed together, used on the coasts of Peru and Brazil. The owner is called a *jangadeira*, but the term is evidently an application of *jergado* (which see).

Jangar. A kind of pontoon constructed of two boats with a platform laid across them; used by the natives in the East Indies to convey horses, cattle, etc., across rivers.

Janissary. A term derived from *jeni cheri*, meaning *new soldiers*, in the Turkish service.

Jarganee. A term for small worms on the sea-shore, used as bait.

Jason. A Thessalian prince, son of Æson, who, with Medea's help, brought away the golden fleece from Colchis.

Java Pot. A kind of sponge of the species *Alcyonum*.

Javels. An old term for dirty, idle fellows, wandering about quays and docks.

Jaws. Anything resembling the jaws of an animal; the points of the jaws are called *horns*. The inner end of a gaff. The space in a block in which the sheave revolves. One of the adjustable opposing parts of a holding implement, as the jaws of a vise or wrench.

JAW-BREAKERS. Long and infrequent words.

JAWING-TACKLE. The organs of speech. *Clap a stopper on your jawing-tackle*, stop talking.

JAWING-TACKS. When a person speaks with vociferous fluency, he is said to have hauled his jawing-tacks on board.

JAW-ME-DOWN. An arrogant, overbearing, and unsound loud arguer.

JAW-ROPE. A line attached to the horns of the jaws to prevent the gaff from coming off the mast. It is usually furnished with bull's eyes (perforated balls) to make it shift easily up or down the mast.

Jayls. The cracks and fissures of timbers in seasoning.

Jeers. A heavy purchase for swaying up and lowering the fore- or main-yard.

JEER-BITTS. Those to which the jeers are fastened and belayed.

JEER-BLOCKS. Twofold or threefold blocks, through which the jeer-falls are rove to hoist and lower the main- and fore-yards.

JEER-CAPSTAN. One placed between the fore- and mainmasts, serving to stretch a rope, heave upon the jeers, etc. It was the spare capstan, and was frequently housed in by sheep-pens and fowl-racks.

JEER-FALL. The rope rove through the jeer-blocks, forming the purchase known as the jeers.

Jeffers, William Nicholson, Commodore U.S.N., chief of Bureau of Ordnance. Born in New Jersey. Appointed from New Jersey acting midshipman, September 25, 1840; ordered to U. S. S. "North Carolina," 74; served in brig "Washington," tender to that ship, for several winter months on coast relief of ships in distress; September, 1841, to frigate "United States," 44; served four years in that ship, and frigate "Congress," 44, on Pacific and Brazil Stations; October 10, 1845, to Naval School at Annapolis; graduated No. 4, and promoted to passed midshipman, July 11, 1846; ordered to steamer "Vixen," 3, and served through the war with Mexico; present at attack on forts of Alvarado, under Commodore Connor; at two attacks on and capture of Tabasco, under Commodore Perry; at capture of Tuspan; of Coatzocoalcos and Laguna de Terminos; covered the landing of the U. S. army at siege of Vera Cruz, and took part with others of Mosquito Fleet in the bombardment of the city of Vera Cruz, and of the castle of San Juan de Ulloa; in 1848–49, on duty at Naval School as acting master and assistant professor of mathematics; December, 1849, to October, 1850, schooner "Morris," coast survey, harbor of Galveston and Gulf of Mexico; October, 1850, to March, 1852, mail-steamer service, between New York and Aspinwall, Havana, Kingston, and New Orleans, a part of the time in command; March, 1852, to screw-sloop "Princeton," 10, as acting master; November, 1852, transferred to frigate "Macedonian," 22, as acting master; December, 1852, exploration of Isthmus of Honduras; September, 1853, to screw-sloop "Alleghany," 10, as acting master; October, 1853, transferred to sloop "Germantown," 20; 1853–54, sloop "Germantown," Brazil Squadron.

Promoted to master, June, 1854.

Commissioned as lieutenant, January, 1855; transferred to U. S. S. "Water-Witch," 3, survey of La Plata and Parana, 1855–56; presented with a sword, with gold hilt and scabbard, by her majesty the queen of Spain, for saving the schooner "Cartagenera," of 10 guns, in October, 1855 (assent of Congress, April, 1858); had an engagement with the fort at Paso de la Patria, which caused the expedition to Paraguay, under Commodore Shubrick, and extorted apology by Paraguay; 1857, preliminary survey of Isthmus of Honduras for Interoceanic Railway; 1858–59, gunnery-ship "Plymouth," 9, West Indies; January, 1859–60, screw-sloop "Brooklyn," 22, and sloop "Saratoga," 20, West Indies; surveyed Chiriqui Isthmus while attached to "Brooklyn"; when the Rebellion broke out he was on sick-leave at his home, but he at once applied for service.

He was immediately detailed to relieve Lieut. G. T. Sinclair on ordnance duty at Norfolk, but that yard having been destroyed before he could reach there, was detailed to keep the Potomac River open; April and May, 1861, command of steamer "Philadelphia," on Potomac River; May to December, 1861, frigate "Roanoke," on blockade Atlantic coast and off Charleston; engagement with batteries at Sewell's Bluff; December, 1861, command of steamer "Underwriter," Pamlico Sound; battles of Roanoke Island, Elizabeth City, and numerous skirmishes,

under Commodore Goldsborough and Commander Rowan; expedition to Currituck Sound, March, 1862, command of "Monitor," after Worden was wounded; various bombardments and battles of Drury's Bluff, under Commander John Rogers.

Commissioned as lieutenant-commander, July 16, 1862; September, 1862, ordnance duty at Philadelphia; September, 1863, to duty as inspector of ordnance, and in charge of experiments at the ordnance yard, Washington.

Commissioned as commander, March, 1865; July, 1865, to command screw-sloop "Swatara," 10, West Indies, Mediterranean, and Africa; 1865–68, under Admirals Goldsborough and Farragut; December, 1868–69, Naval Observatory; 1869–70, Board of Examiners.

Commissioned as captain, July, 1870; September 30, 1870, to duty as assistant in Bureau of Ordnance; October, 1871, to command gunnery-ship "Constellation," West Indies and coast; April 10, 1873, chief of Bureau of Ordnance, with relative rank of commodore; in 1875, introduced a system of B. L. boat howitzers of bronze and of steel; and in 1876 doubled the power of the Dahlgren M. L. 11-inch smoothbore by converting it into an 8-inch rifle; also commenced the conversion of Parrott 100-pounder to B. L. on the slotted screw principle; worked up the details of a system of breech-loading for every calibre up to 12-inch; April 10, 1877, renominated chief of Bureau of Ordnance for four years; author of "Short Methods in Navigation," 1849; "Theory and Practice of Naval Gunnery," 1850; "Marine Surveying," 1871; and of numerous pamphlets on professional subjects; editor of "Inspection and Proof of Cannon," 1864; "Ordnance Instructions for U. S. Navy," editions of 1866 and 1880.

Commissioned as commodore, February 26, 1878.

Jelba. A large coasting-boat of the Red Sea.

Jelly-fish. A common name for the *Medusæ*, soft gelatinous marine animals, belonging to the class *Acalephæ*.

Jemmy. A finical fellow. Also, a handy crow-bar or lever.

Jemmy Ducks. The ship's poulterer. A sobriquet which has universally obtained in English men-of-war.

Jenkins, Thornton A., Rear-Admiral U.S.N. Born in Virginia, and appointed midshipman from that State, November 1, 1828; attached to sloop-of-war "Natchez," West Indies, 1828–31; in boat squadron, in 1829, cruising for pirates on coast of Cuba; in sloop-of-war "Vandalia," West Indies, in 1831–33.

Passed examination for promotion to lieutenant, June 2, 1834, and awarded by the Examining Board No. 1 of the class of 82 graduates. On the coast survey, 1834–42.

Commissioned as lieutenant, December 9, 1839; served in the frigate "Congress," Brazil and Mediterranean Squadron, 1842–45, being present at the capture of the Buenos Ayrean squadron, off Montevideo, September 29, 1844; on special service in Europe in 1845–46; was executive-officer of sloop-of-war "Germantown," in Gulf of Mexico, during the Mexican war; and latter part, commanding store-ship "Relief," same squadron, 1847–48; commanded part of the forces employed in the capture of Tuspan and Tabasco; on the coast survey, 1848–52; acted as secretary of Light-House Board from 1853–58.

Commissioned as commander, September 14, 1855; commanding sloop-of-war "Preble" on Paraguay Expedition, on Brazil Station, coast of Central America, and in Gulf of Mexico, 1858–60. Present at the capture of the armed vessels "Miramon" and "Marquis of Havana," off Vera Cruz, and under the walls of that city and the Fort of St. Juan de Ulloa, during the siege and bombardment by the insurgent forces of Gen. Miramon. Charged with conveying the prizes "Miramon" and "Marquis of Havana" and transporting their crew and passengers as prisoners to New Orleans. Secretary of Light-House Board, 1861.

Commissioned as captain, July 16, 1862; commanding steam-sloop "Wachusett," on James and Potomac Rivers, 1862; being senior officer, present at repulse of the enemy at Coggin's Point, James River, and at the attack on our flotilla, off City Point, James River, August, 1862; commanded steam-sloop "Oneida," West Gulf Blockading Squadron, off Mobile, in the fall of 1862; was appointed fleet-captain and chief-of-staff of Farragut's squadron, and was present at the passage of Port Hudson, March 14, 1863 (see Farragut's Report); fought Grand Gulf batteries, March 19, 1863; Warrenton, March 21, 23, 25, and 28, 1863; Grand Gulf, March 30, 1863; on the blockade of, during the siege prior to the surrender and attack on Port Hudson, May 24, 27, and 28, 1863. Wounded on board steamer "Monongahela" in fight with enemy's batteries stationed on Madame Winchester's farm, College Point, Mississippi River, being in command of three armed vessels conveying provisions, arms, and ammunition to the army and navy operating below Port Hudson; commanding steam-sloop "Richmond," and senior naval officer in command of naval forces below, at the time of the surrender of Port Hudson, July 9, 1863; commanding division, blockading Mobile entrance, etc., from December, 1863, to battle of Mobile Bay, August 5, 1864, in which he took part, as well as the surrender of Forts Morgan, Gaines, and Powell, August 29; left in command of the Mobile Bay Division, until February, 1865; March 14, 1865, ordered to James River, remained there until after Lee surrendered to Gen. Grant.

Admiral Farragut, in his detailed report of the Mobile affair, says, "Before closing this report, there is one other officer of my squadron of whom I feel bound to speak, Capt. T. A. Jenkins, of the 'Richmond,' who was formerly my chief-of-staff, not because of his having held that position, but because he never forgets to do his duty to the government, and takes now the same interest in the fleet as when he stood in that relation to me. He is also commanding officer of the second division of my squadron, and as such, has shown ability and the most untiring zeal. He carries out the spirit of one of Lord Collingwood's best sayings,—'not to be afraid of doing too much; those who are, seldom do as much as they ought.' When in Pensacola, he spent days on the bar, placing buoys in the best position, was always looking after the interests of the service, and keeping the vessels from being detained in port one moment more than necessary. The

gallant Craven told me only the night before the action in which he lost his life, 'I regret, admiral, that I have detained you; but had it not been for Capt. Jenkins, God knows when I should have been here. When your order came I had not received an ounce of coal.' I feel that I should not be doing my duty if I did not call the attention of the Department to an officer who has performed all his various duties with so much zeal and fidelity."

Commissioned as commodore, July 25, 1866; in August, 1865, appointed chief of Bureau of Navigation and Detail, and held that position until April, 1869, when he resigned, and was ordered to duty as secretary of the Light-House Board.

Promoted to rear-admiral, August 15, 1870; ordered to command the U. S. naval forces on Asiatic Station, in December, 1871; relieved in China, December, 1873; retired, December 11, 1873; appointed by the President, March 25, 1874, commissioner to represent the Navy Department at the United States International Centennial Exhibition of 1876, at Fairmount Park, Philadelphia.

Jerbe. See JELBA.

Jeremitas. An ancient name for fire-ships.

Jergado, or Gingado. A term for a light skiff of the 16th century.

Jerkin. An old name for a coatee, or skirted jacket.

Jerome. A trading vessel of Egypt.

Jerquer (*Eng.*). A customs officer, whose duty is to examine the landwaiters' books, and check them.

JERQUING A VESSEL. A search performed by the jerquer of the customs, after a vessel is unloaded, to see that no unentered goods have been concealed.

Jersey. Fine wool, formerly called gearnsey, ganzee, or guernsey. *Jersey frocks*, woolen frocks supplied to seamen.

Jersey City. The principal city of New Jersey, on the right bank of the Hudson River, opposite New York City, from which it is 1 mile distant and in constant communication with by means of 5 large ferries running over 30 boats. The Cunard, White Star, Red Star, and Cardiff lines of ocean steamers have extensive docks in Jersey City, and it is also the terminus of the Pennsylvania, Delaware, Lackawanna and Western, New Jersey Central, Erie, New Jersey Midland, Northern New Jersey, and several smaller lines of railroads. Large manufactories of all kinds, sugar-refineries, stock-yards and ship-yards, are located here. Pop. 120,000.

Jervis, John (Earl St. Vincent). British admiral. Born January 9, 1734. Commissioned lieutenant, 1755. Promoted to rear-admiral, 1787. This officer saw much service afloat, and when a post-captain in the British navy took the islands of Guadaloupe and Martinique from the French. But the event which procured his elevation to the peerage was his signal defeat of a Spanish fleet off Cape St. Vincent. Died March 13, 1823.

Jet. A stream of fluid issuing from an orifice, as a jet of steam, a jet of water, etc.

JET-CONDENSER. The vessel in which the exhaust steam of a steam-engine is condensed by mingling with a jet or spray of cold water.

Jetsam, or Jetson (Fr. *jeter*, to throw). Goods thrown overboard, for the purpose of lightening the ship in case of extreme peril, which sink and remain under water. Goods which remain upon the surface after being cast overboard are called *flotsam*; if they are buoyed they are called *ligan*.

Jettison. A word allied to jetsam and by some considered as synonymous with it; more properly, however, it signifies the act of throwing goods overboard, or the cutting or casting away of anything appertaining to the vessel, to lighten the ship when in extreme peril. The object of a jettison being to secure the safety of the vessel and remaining cargo, the loss incurred becomes the subject of general average (which see). It is to be observed, however, that not every casting of goods overboard, cutting away of masts, etc., constitutes such a jettison as to make a case for general average. To bring the jettison within the rules governing general average it must be voluntary; the peril must be not merely great, but extreme; and it must be the price of safety to the ship and remaining cargo.

Jetty. An erection projecting into the water, of the nature of a pier, dike, or embankment, constructed of timber, earth, fascines, stone, etc., or a combination thereof. By means of jetties at the mouths of rivers and the entrance to tidal harbors, the channel may be so narrowed and the current so concentrated as to much deepen the water over the entrance bars. Numerous instances of this application of jetties exist in Europe and this country, one of the most notable of which is the recently constructed Eads jetties at the mouth of the Mississippi River.

JETTY-HEAD. The projecting part of a wharf; the front of a wharf whose side forms one of the cheeks of a dock.

Jew-balance. A Mediterranean name of the *Zygæna malleus*, or hammer-headed shark.

Jewel-block. A small block at the extreme end of the topsail and topgallant-yard, through which reeve the halliards of the topmast and topgallant studding-sails.

Jew's-harp. The shackle for joining a chain-cable to the anchor-ring.

Jib. A large triangular sail set on a head-stay. In large vessels it extends from the outer end of the jib-boom well up towards the fore topmast-head. In cutters and sloops it extends from the bowsprit towards the lower mast-head. Of the various sails enumerated below, only the jib and flying jib are in common use. Also, the arm of a crane, one end of which is jointed to the post, the other connected to the post by a tie, so that the downward pull of a suspended weight is decomposed into a tensile strain on the tie, and a compressional strain on the jib, which acts as a strut.

JIB AND STAY-SAIL JACK. A designation for a fidgety officer who harasses the watch by continually calling upon them to make, shorten, or trim sail.

JIB-BOOM. A spar rigged out through the bowsprit-cap, the heel being clamped to the bowsprit.

JIB-BOOM, FLYING. A light spar rigged out through a wythe at the end of the jib-boom.

JIB, FLYING. A sail set on a stay extending from the outer end of the flying jib-boom to the topgallant mast-head.

Jib-foresail. The stay-foresail of a sloop.

Jib-frame. The upright frame at the sides of a marine-engine, connecting the cylinder, condenser, and framing; when applied to the beam-engine it is sometimes called the *gallows-frame.*

Jib-guys. Ropes which give lateral support to the jib-boom. They lead from the outer end of the jib-boom to the ends of the whiskers, and thence to the bows where they set up.

Jib-guys, Flying. Ropes which bear the same relation to the flying jib-boom that the jib-guys do to the jib-boom. See Jib-guys.

Jib, Inner. A head-sail which is sometimes set just abaft the jib proper, which is then called the *outer jib.*

Jib-netting. A triangular net-work under the jib-boom, which is seized to the whiskers and jib-guys.

Jib-netting, Flying. A small net-work under the flying jib-boom, which is seized to the flying jib-guys.

Jib-o'-jib. A sail known only to flying kite-men, it being the outermost of the head-sails.

Jib, Outer. See Jib, Inner.

Jib, Spindle-. A jib set between the flying jib and jib-o'-jib.

Jib-stay. A stay leading from the fore top-mast-head through a sheave in the outer end of the jib-boom. In the steam-engine, the jib-stay is a portion of the jib-frame.

Jib-stay, Flying. A stay leading from the fore topgallant mast-head through a sheave in the outer end of the flying jib-boom.

Jib-topsail. A light sail set on the topmast stay of a fore-and-after.

Jib-traveler (*Obs.*). An iron ring fitted to run out and in on the jib-boom, for the purpose of bringing outwards or inwards the tack of the jib.

Jibber the Kibber. A cant term for the trick of decoying vessels on shore for plunder. A lantern is suspended from a horse's neck, and one of his fore-legs is hobbled; being driven along the beach, the irregular motion of the lantern resembles the motion of a ship's light. Seeing a light inshore, the impression is given that there is plenty of sea-room, and the ship is likely to be stranded.

Jibe. To shift over the boom of a fore-and-aft sail, with the wind aft or on the quarter.

Jiddah. A seaport town and one of the principal trading entrepôts of Arabia. Lat. 21° 28′ 3″ N.; lon. 39° 13′ E. Pop. 18,500. The harbor is good, and the imports from Abyssinia, Egypt, India, Malay Archipelago, and England are very extensive. Slaves are also imported from Zanzibar. Exports consist of coral, Egyptian cotton goods, sword-blades, matchlocks, and Oriental goods of all kinds, with dates, coffee, etc.

Jiffy. *In a jiffy*, in an instant.

Jig. The weight furnished with hooks, used in jigging (which see). To make short pulls on a rope or tackle.

Jiggamaree. A mongrel makeshift manœuvre. Any absurd attempt to substitute a bad contrivance for what the custom of the sea may be.

Jigger. A very teazing sand-flea, which penetrates and breeds under the skin of the feet, but particularly at the toes. It must be removed, or it occasions much pain. The operation is effected by a needle, and the sac which contains the brood must not be broken, or the whole foot would be infected. A light tackle used about the decks, in the tops, etc.; a handy-billy. A sail set on a jigger-mast.

Jigger-mast. A small mast stepped on the extreme after-part of small craft.

Jiggered-up. Done up; tired out.

Jigging. A mode of catching fish by dropping a weighted line with several hooks set back to back among them, and jerking it suddenly upwards; the weight is frequently cast in the form of a small fish. Also, short pulls at a tackle fall.

Jilalo. A large passage-boat of Manilla, fitted with outriggers.

Jimmals, or Jimbles. See Gimbals.

Jimmy Legs. A sobriquet for the master-at-arms.

Jingal. A kind of long heavy musket supported about the centre of its length on a pivot, carrying a ball of from a quarter to half a pound, and generally fired by a matchlock; much used in China and the Indies. It is charged by a separate chamber, dropped into the breech and keyed.

Jinny-spinner. One of the names for the cockroach.

Jobation. A private but severe lecture and reprimand.

Job Captain (*Eng.*). One who gets a temporary appointment to a ship, whose regular commander is a member of Parliament, etc.

Job-watch. A hack-watch.

Jocks. Scotch seamen.

Jog-the-loo. To work the pump-brake, or to pump briskly.

John. A name given to dried fish. See Poor John.

John Bull. The origin of this nickname is traced to a satire written in the reign of Queen Anne, by Dr. Arbuthnot, to throw ridicule on the politics of the Spanish succession. In this satire, which is usually published in Swift's works, the French are designated as Lewis Baboon, the Dutch as Nicholas Frog, etc.

John Chinaman. A popular name for the Chinese. The earliest known instance of its use is in "A letter to the Committee of Management of Drury Lane Theatre," London, 1819, p. 64.

John Company (*Eng.*). The former board of directors for East India affairs.

John Dory. A corruption of *jaune doré*, which is the color of this fish. It is one of the Scomberidæ, *Zeus faber.* John Dory was also the name of a celebrated French pirate.

Johnny Crapaud. A jocose designation of a Frenchman, or of the French nation taken collectively. In Seward's Anecdotes occurs the following account of the origin of this designation: "When the French took the city of Aras from the Spaniards, under Louis XIV., after a long and most desperate siege, it was remembered that Nostradamus had said, 'Les anciens *crapauds* prendront Sara.' (The ancient toads shall Sara take.) This line was then applied to this event in a very roundabout manner. *Sara* is *Aras* backward. By *ancient toads* were meant the French; as that nation formerly had for its armorial bearings three of those odious reptiles instead of the three flowers-de-luce which it now bears."

The grounds for the belief that three toads or three frogs were the old arms of France are very

fully set forth in Elliott's "Horæ Apocalypticæ," vol. iv. p. 64, ed. 1847.

Johnny Raw, or **Johnny Newcome.** An inexperienced youngster commencing his career; also applied to landsmen in general.

Johnny Shark. A common sobriquet of the Squalus tribe.

John-O'-Groat's Buckie (*Eng.*). A northern name for the *Cypræa pediculus*, a small shell found on the sea-coast.

John Tuck. The galley corruption of *chantuck*, or *jantook*, a Chinese viceroy, specially meaning the viceroy of Canton.

Jol. A Danish yawl.

Jolly (*Eng.*). This term is usually applied to a comely and corpulent person, but afloat it is a familiar name for a soldier. *Tame jolly*, a militia-man; *royal jolly*, a marine.

Jolly-boat (*Eng.*). A smaller boat than the cutter, but likewise clincher-built. It is generally a hack boat for small work, being about 4 feet beam to 12 feet length, with a bluff bow and very wide transom; a kind of washing-tub.

Jolly Jumpers. Sails above the moon-rakers.

Jolly Roger. A pirate's flag; a white skull in a black field.

Jones, John Paul, was the son of John Paul, and was born at Kirkcudbright, in Scotland, July 6, 1747. Went to sea as apprentice at the age of 12, voyaging to America. Made several voyages as third mate of a slaver, and at 19 was first mate, and at 21 had command of the "John," a ship in the West India trade. Afterwards traded in a vessel on his own account, and left the sea at the age of 26, adopting the name of Jones. In December, 1775, was appointed lieutenant in the navy, and ordered as first lieutenant of the "Alfred," our first flag-ship. He hoisted the first flag of the colonies afloat,—the yellow flag with the pine-tree and rattlesnake. He participated in the capture of the "New Providence" and the attack on the "Glasgow." Was made captain of the "Providence," and being chased by a squadron off New York, escaped them by good seamanship, June 13, 1776; and he afterwards made 16 prizes, some valuable. On October 10 he was named eighteenth captain, and in command of the "Alfred" and "Providence" captured a valuable armed ship and two prizes, and eluded a recapture by good seamanship. He next went to Europe in command of the "Ranger," 18, and received from the French squadron the first salute to the stars and stripes. He cruised in English waters, burning shipping at Whitehaven and spiking guns ashore, and then attempted to carry off the Earl of Selkirk, but failed. Some plate having been carried away, he gained the name of "Pirate." On the 24th of April he took the "Drake," 20 guns. Received from the French the "Duc de Duras," an old Indiaman, and sailed in her, in company with 6 other ships, naming his new vessel the "Bon Homme Richard." He had 40 guns and a mixed crew of various nationalities. The conditions under which he sailed prevented him from carrying out several projects, but on the 23d September he fell in with a Baltic fleet convoyed by the "Serapis," 44, and "Countess of Scarborough," 20. The latter was captured by one of his squadron, and Jones, in one of the most desperate fights on record, in which his own ship was so disabled as to sink soon afterwards, captured the "Serapis," a superior ship to his own. He sailed for home in the "Ariel," 20, in September, 1780; lost his masts, put back, and sailed again on the 18th December. He was launched in the "America," 74, and transferred her to the French, making a cruise as a volunteer in her. He was a prize agent in Europe in 1783, and finally, in 1787, while in Denmark, he entered the Russian navy. Hoisted his flag as rear-admiral in the "Walodomir," 26th May, 1788, but found so much jealousy and enmity towards him that he resigned in 1789. He resided in Holland and France afterwards, and was appointed commissioner to Algiers just as his death occurred, on the 18th of July, 1792, aged 45. He was brave and energetic, but violent and vain.—*F. S. Bassett, Lieutenant U. S. Navy.*

Jones, Thomas Catesby, Commodore U.S.N. Of Welsh descent. Born in 1789; died in Georgetown, D. C., May 30, 1858. Entering the navy November 22, 1805, he became lieutenant May 24, 1812, commander March 28, 1820, and captain March 11, 1829. From 1808 to 1812 he was engaged in the Gulf of Mexico, and distinguished himself in the suppression of piracy, smuggling, and the slave-trade. When the British naval expedition against New Orleans entered Lake Borgne, he, with a small flotilla, endeavored to intercept 40 British boats. Although wounded and compelled to surrender, his conduct was highly commended. In 1842 he commanded the Pacific Squadron, and having, from erroneous information as to the existence of war between the United States and Mexico, caused the governor of Monterey to surrender that place, he was for this indiscretion relieved from his command.

Jonk. See JUNK.

Joso. A small fish of the gudgeon kind.

Joule's Equivalent. The quantity of heat that will raise one pound of pure water, at the maximum density and temperature of 39.1°, one degree F.; the equivalent in work being 772 foot-pounds.

Journal. Ensigns and midshipmen are required to keep journals, which are presented monthly for the inspection of the commanding officer. In some ships this journal must be a copy of the log-book; in others, only an abstract is required. *Journal* is also the part of a revolving or oscillating portion of a machine which is supported by or runs in bearings. It may be cylindrical, conical, or spherical.

JOURNAL-BEARING. The support of the shaft or axle, composed of the brasses or boxes in a pillow-block, or that part of the engine frame intended for the purpose.

JOURNAL-BOX. The composition lining of bearings to reduce friction.

JOURNAL-BOX METAL. Usually an alloy of copper, tin, and zinc, and sometimes antimony.

Jowder. A term to denote a retail dealer in fish.

Juan-Mooar. The black-backed gull.

Jubaltare. The early English word for Gibraltar.

Judge-advocate. The person appointed to act as public prosecutor at a court-martial is designated by law as the judge-advocate. Regarded etymologically, this term is certainly a misnomer, for the subject is, in point of function, neither a judge nor an advocate. He has no

power to hear and determine cases, nor to pass sentence, and it is not his duty to plead the cause of any one. Rather is he a prosecuting recorder. While his duties are multifarious and highly important, the chief ones are to produce and lay before the court all of the evidence against the person accused, and to record with exactness, under a solemn oath, all that transpires which it is necessary for the convening and ultimate reviewing authority to know. We are probably indebted for the imposing title to a fusion of two expressions formerly applied to a higher office in Great Britain, viz., "judge-martial" and "advocate-general," and since nearly all language is arbitrary, should not seriously object. See JUDGE-ADVOCATE-GENERAL.

Usually a commissioned officer of the army or navy is appointed to this office, although civilians are eligible, and until within the last ten years were frequently thus employed. The emoluments of the office were so liberal to them that in March, 1865, Congress found it necessary to enact that "the fees for record in naval courts-martial shall not exceed in any one case $200." Instances were known where officers had temporarily resigned their positions in order to become entitled to the large fees, as citizens, when appointed judge-advocate. The practice of appointing civilians is strenuously objected to on different grounds by all writers on military law, and may now be considered obsolete. Only military persons should so act, and they should be selected for their special fitness. Simmons, a distinguished authority, speaks of the judge-advocate as "the PRIMUM MOBILE of a court-martial," and Hughes, author of "Duties of Judge-Advocates," says that fitness consists in the possession of "superior attainments and abilities as lawyers and soldiers, the qualifications of *both* professions being requisite for this specific duty." As they are called upon to act in the threefold capacity of representative of the government, recorder of the proceedings, and as the legal adviser of the court (and not unfrequently as counsel for the accused), it is necessary that they should have a correct knowledge of the fundamental principles of law in general, and a thorough special knowledge of the practice of courts-martial.

The "Regulations for the Administration of Law in the Navy" (Sec. 161) prescribe that "Judge-advocates of all naval general courts-martial, whether convened in the United States or abroad, will be appointed by the Secretary of the Navy only, who will select a competent commissioned officer to perform this important and responsible duty in each foreign fleet or squadron." The detail generally falls to the officers of the marine corps, many of whom have made military law a special study, and all of whom, prior to July 1, 1870, received an allowance of $2.50 per diem for every day necessarily employed in the duty of the court.

The first semblance of a court-martial with judge-advocate and provost-marshal in England —our prototype—was authorized by an ordinance of Parliament in 1644, during the reign of Charles I. The Earl of Essex, general of the forces, and 56 others named in the ordinance, or any 12 of them, were made commissioners to try "all such causes as belonged to military cognizance," and were empowered to appoint "a judge-advocate, a provost-marshal, and all other officers needful." The Swiss Guards, in the service of France, had a *juge*, who was a sort of judge or provost-marshal for each company, and each regiment had a superior one who presided over the others. Their duties seem to have partaken of the nature of those of both judge-advocate and provost-marshal.

Notwithstanding the antiquity of the office, its functions are so faintly described by statute that in summing them up one is obliged to resort to the less positive though equally binding authority of established usage and practice, which, as between army and navy, is in this, as in other respects already set forth, far from uniform. (See COURTS-MARTIAL.) For some reason, possibly a morbid jealousy of authority, the office of judge-advocate in the navy, though equally indispensable, is much less potential than in the army, and unless the former is familiar with and tenacious of his powers and privileges, his character as the representative of the government is apt to be dwarfed into that of clerk to the court.

While the army judge-advocate is not only the medium of communication between the appointing power and the court, but between the court and the accused, and the witnesses, and is the first person furnished with the charges, list of witnesses, and other papers bearing on the case, which he has to prepare for trial and present, the naval judge-advocate finds the president, disinterested and distant (sometimes 500 miles), in possession of them, and often enters court at 12 M. of the day appointed to get his first knowledge of what is to be done. The president then turns over to him the papers, and he asks for time to "especially instruct himself in all the circumstances," etc., as required by Regulations. A few other points of difference are worthy of note. In the army the judge-advocate has authority to alter or amend the charges, and may even substitute a new set, but in the navy, when faulty, they must be returned to the convening authority. The naval judge-advocate is sworn "to keep a true record" and to secrecy, but he of the army to secrecy only. The latter orders the attendance of prisoners, swears the witnesses, receives the reports of absent members stating cause of non-appearance, and notifies the convening officer of any changes in the court, or adjournments in certain cases; in the navy all this is done by the president.

The duties of a naval judge-advocate, as laid down by the Regulations above cited, and otherwise understood, are, when practicable, briefly as follows: "Upon being notified that a court is to convene, and furnished (?) with such papers and instructions as may be considered necessary for his guidance," he will ascertain that the accused has a true copy of the charges and specifications preferred against him, at least 24 hours before trial, also a list of the witnesses who are to appear against him; call upon him for a list of persons he may desire to testify in his behalf, and summon all that may be necessary for either prosecution or defense; inquire what facts they can establish prior to their introduction, and prepare a short analysis or plan for the conduct of the case. (See WITNESS.) Under the authority of the commanding officer of the station or vessel where the court is to convene, he sees that a suitable place is provided, and supplied with writing materials and such other articles as

may be needed for the use and comfort of the court; obtains such books of reference as may be called for; has the necessary guards and orderly detailed, and some accommodations made for spectators who may attend. He then "examines critically" the charges and specifications, and advises the court of any errors discovered; notifies the accused of any alterations which may be directed; sees that the whole is embodied in the record; and furnishes the court with a duplicate for its use. He appoints a clerk, or reporter; procures an interpreter if required; observes that the court is organized agreeably to precept, and notes each day in the record who are present or absent. He takes care that the accused has counsel if he so desires, and that he enjoys the right of challenge, and, if he declines counsel, will himself act so far as to see that he has every facility afforded him, that his rights are not infringed, and that he suffers no disadvantage through ignorance. The record must be kept in prescribed form on prescribed paper, and show most particularly that the court, judge-advocate, and all of the witnesses were duly sworn in the presence of the accused; that he was allowed every opportunity to examine witnesses; that they pronounced their testimony correct before being discharged; that he was allowed time to prepare a statement or defense in writing; that he is the person convicted and sentenced, or acquitted; and that the whole is properly authenticated by the signatures of all of the members and himself. A smooth and legible record made from the rough notes of the preceding day is to be presented and read by him to the court immediately upon convening each day, and all errors corrected without erasure or interlineation. Each case must be kept separately, and show all changes in the composition of the court, all questions and answers, motions, rulings, etc., and have all accompanying documents appended and numbered, or lettered, for reference. The proceedings of each day appear as a chapter marked "Second Day," "Third Day," and so on, and the finding and sentence must be in his own handwriting. Questions put to witnesses by others than himself, and all motions and objections by the accused are written on slips of paper and pasted to the rough notes.

He may assist the accused to prepare his defense, or read it for him, after which he has the right of reply and to the last word. He takes the vote of the court as to finding and sentence; but the president obtains the opinion of the court on questions of evidence, adjournment, etc. Decisions of the court are announced to the witness or accused by the judge advocate. Not being a member he has no vote, is not responsible to the civil authority for his opinions, and cannot be challenged, although he has the right to challenge any member suspected of undue partiality for, or interest in, the accused. While he may sum up the evidence, and call attention to facts, it is not proper for him to give an opinion as to the guilt of the accused, nor earlier in the trial to advise the accused to plead guilty. He is a competent witness for either side, and, if called, should be sworn by the president, interrogated by the court or the accused as the case may be, and have his testimony recorded by the clerk; or if necessary he may do it himself. Should he die, or be disabled, pending the proceedings, another may be detailed, unless it happens between the conclusion of the trial and the authentication of the record, in which rare event the sentence is inoperative (Holt's Digest). The court cannot appoint a judge-advocate, no member can act as such, and a vacancy must be referred to the convening officer. His absence during the trial does not invalidate the proceedings, but should be avoided if possible. When it cannot be helped it is better for the court to adjourn from day to day until his return.

Finally, he gives certificates of attendance to the witnesses and such members as are entitled to allowances; forwards the record through the president, and if he has been patient, respectful, impartial, and sedulously careful of the rights of all concerned, he has performed an arduous duty well.—*Henry C. Cochrane, Captain U.S.M.C.*

Judge-advocate-general. This title is comparatively new in the United States, where it is given to two officials who are appointed by the President, by and with the advice and consent of the Senate. In the army it is held by the senior law officer, who is also chief of the Bureau of Military Justice, an outgrowth of the Rebellion, and enjoys the rank, pay, and allowances of a brigadier-general. The first judge-advocate-general in this country was the Hon. Joseph Holt, of Kentucky, who was appointed colonel and judge-advocate-general, September 3, 1862; promoted to brigadier-general, June 22, 1864, and retired at his own request (being over sixty-two years of age), December 1, 1875. He was succeeded by Brig.-Gen. Wm. McKee Dunn, the present incumbent, who has under his direction a corps of eight judge-advocates with the rank and pay of major of cavalry. Prior to the institution of the office of judge-advocate-general (1862), there was but one judge-advocate for the entire army, and he was required to be selected from the captains of the line of the army, and given the brevet rank and pay of a major of cavalry. The office seems to have been first established in the regular army March 3, 1797, by an act which authorized a judge-advocate to be taken from the commissioned officers of the line, and granted extra pay and rations.

In the navy, we find that Congress, by act of March 2, 1865, authorized the President to appoint "for service during the Rebellion, and one year thereafter, an officer in the Navy Department to be called the Solicitor and Naval Judge-Advocate-General." To this office was appointed a civilian, the Hon. John A. Bolles, of Massachusetts, who held it until his death, in 1878. After the term for which it was created had expired, it was with great difficulty that the Congress was induced to continue it. Indeed, one year passed without any appropriation being made for the salary of the incumbent. When the office of the Attorney-General of the United States was reorganized, and the Department of Justice established in 1870, there was included in its *personnel* "a naval solicitor, at a salary of $3500 a year," and that is all that was said of this important office. Mr. Bolles's name was dropped from the navy register and placed upon the rolls of the new department. At his death he was succeeded by Capt. William B. Remey, U. S. Marine Corps, as "acting judge-advocate-general" until June 8, 1880, when, mainly through his exertions, a bill was passed by Con-

gress which placed the office upon a better footing than it had ever known. This measure authorized the President to appoint from the officers of the navy or marine corps, for the term of four years, a judge-advocate-general of the navy, with the rank, pay, and allowances of a captain in the navy or a colonel of the marine corps, as may be, and Capt. Remey was the first appointee, with the rank of colonel.

His place of duty, or office, was fixed in the Navy Department, "where he shall, under the direction of the Secretary of the Navy, receive, revise, and have recorded the proceedings of all courts-martial, courts of inquiry, and boards for the examination of officers for retirement and promotion in the naval service, and perform such other duties as have heretofore been performed by the solicitor and naval judge-advocate-general," a title, by the way, then extinct for ten years. As these duties had never been very particularly defined, or generally understood, the Secretary of the Navy, Hon. R. W. Thompson, issued a circular June 28, 1880, also a general order of same date (No. 250), prescribing them minutely, and thus the law was promptly made operative and the office strongly established.

The circular announced that all matter submitted to the Secretary involving questions of law or regulation would be referred by him, or the chief clerk acting under him, to the judge-advocate-general for examination and report, and directed that the chiefs of the several bureaus and the officers connected with the Navy Department, and the clerks of the Secretary's office, should furnish the judge-advocate-general with all such facts and information of record, bearing upon cases under consideration by him, as he might require, and that the records of all courts, boards, etc., should be filed in his office. The general order informed the service of the creation of the office, and ordered that the proceedings of all courts, boards, etc., convened by order of the Secretary of the Navy should be forwarded *direct* to the judge-advocate-general, who shall report upon and have them recorded; and all proceedings of courts, boards, etc., convened by other naval authority shall, after action thereon by the convening and reviewing officers, be forwarded and treated in the same manner. All communications pertaining to questions of law or regulation arising before courts and boards which may require the action of the Department are also to be sent to this officer direct.

Turning to England, we find that there was in the olden time a "judge-martial," or "advocate-general," who was the supreme judge in martial law as to the jurisdiction and powers of military courts. It devolved upon him, as well as upon his deputies, "to be well acquainted with the laws of the land, that they may admonish the court, or president, when the proceedings tend to infringe the civil law." He was "the register of courts-martial," and took down the evidence "in the very words of the witness," but was neither a judge nor a juror as to the charge.

This official is now "The Rt. Hon. the Judge-Advocate-General, London," the adviser of the crown in matters of military law, a barrister, member of Parliament, and of the Privy Council. The proceedings of all district, garrison, and general courts-martial are submitted to him for approval, the latter being laid before the queen by him for confirmation. A deputy judge-advocate is appointed to attend at all general courts-martial and advise the courts as to points of law. In general courts he prepares the charges against the accused, but in other courts this is done by the commanding officer. See JUDGE-ADVOCATE.—*Henry C. Cochrane, Captain U.S.M.C.*

Julian Period. A period of 7980 years, dating from B.C. 4713; being the product of the numbers 15, 19, and 28 multiplied into each other, they being respectively the lengths, in Julian years, of the Indiction, Metonic Cycle, and Solar Cycle. The Julian year was a period of 365¼ days, which was adopted as the length of the year after the reformation of the calendar by Julius Cæsar. See CALENDAR.

Jumper. A loose frock descending to the ship and worn outside the trousers. A rope attached to the outer end of the whiskers to keep them from canting upwards.

Jump-jointed. Flush-jointed; applied to the plates of an iron vessel.

Jungada. See JANGADA.

Junk. The Chinese junk is the largest vessel built by that nation, and at one period exceeded in tonnage any war-vessel then possessed by England. The extreme beam is one-third from the stern; it shows no stem, it being chamfered off. The bow on deck is square, over which the anchors slide fore and aft. Having no keel, and being very full at the stern, a huge rudder is suspended, which at sea is lowered below the depth of the bottom. The masts are immense, in one piece. The hull is divided into water-tight compartments, like tanks. *Junk* is also remnants or pieces of old cable or condemned rope, cut into small portions for the purpose of making points, mats, swabs, gaskets, sennit, oakum, and the like. Also, a dense cellular tissue in the head of the sperm-whale, infiltrated with spermaceti. Also, salt beef, as tough to the teeth as bits of rope, whence the epithet.

JUNK-WAD. See WAD.

Junket. A long basket for catching fish.

Junketing. Good cheer and hearty jollification.

Jupiter. The largest planet of the solar system. The mean distance of Jupiter from the sun is 496 millions of miles, and, since the eccentricity of its orbit is about 1-20th, this distance is augmented in perihelion and diminished in aphelion by about 24 millions of miles. Jupiter makes a revolution about the sun in 11.8 years; it revolves on its axis in $9^h\ 55^m$; its equatorial diameter is 92 millions of miles; apparent diameter 30″ to 48″, and its volume is 1400 times that of the earth. Viewed through a powerful telescope Jupiter exhibits a light yellowish color, having a series of brownish-gray streaks, called *belts*, running nearly parallel to the equator. Jupiter is attended by 4 satellites at distances varying from 280 to 1200 thousand miles, and varying in size from 12 hundred to 35 hundred miles. Jupiter is a body of the greatest importance to the navigator; for besides serving in a pre-eminent manner the ordinary purposes of bright stars, such as determining the latitude, and also by its lunar distances furnishing the means of finding the longitude, the eclipses of Jupiter's satellites give an independent method of obtaining the longitude. Symbol ♃, from the initial of Zeus, the Greek name of Jupiter.

Jurebasso (*Eng.*). A rating in former times given to a handy man, who was partly interpreter and partly purchaser of stock.

Jurisdiction. The legal power or authority of the government or of a branch thereof. The limit within which power may be exercised; extent of power or authority. See INTERNATIONAL LAW.

Jury-anchor. See ANCHOR.

Jury-mast. A temporary mast erected in a ship in the place of one which has been carried away in a gale, battle, etc. Jury-masts are sometimes erected in a new ship to navigate her down a river, or to a neighboring port, where her proper masts are prepared for her.

Jury-rudder. A contrivance, of which there are several kinds, for supplying a vessel with the means of steering when an accident has befallen the rudder.

Jus Piscandi. The right of fishing.

Jute. The fibre of an East Indian plant (*Corchorus capsularis*), and, also, of the plant *Corchorus olitorius.* It is used for making rope, matting, gunny, and other coarse fabrics.

Juwaur. The spring-flood of the Ganges and adjacent rivers.

K.

Kabbilow. Codfish salted but not thoroughly dried.

Kabozir. A chief or governor on the African coast.

Kaburns. An old word for nippers.

Kafila. An old word for a convoy of merchant-vessels.

Kalmar. A fortified town and seaport of Sweden, capital of a læn of the same name. It is situated on the southeast coast, on the Kalmar Sound, opposite the island Oland, about 200 miles S.S.W. of Stockholm. It is the terminus of a railway, and has a good harbor, a fine church, a prefecture, a strong castle, now a house of correction, an academy, a gymnasium, a dockyard, and manufactories of woolen stuffs, tobacco, and potash. In its castle the treaty called the "Union of Kalmar," which settled the succession of the three northern kingdoms upon Queen Margaret of Denmark and her heirs forever, was agreed to by the deputies of the three kingdoms on the 12th of July, 1397. The union, however, lasted only till the death of Margaret. Pop. about 10,000.

Kamsin. A southwesterly wind which blows over Egypt during March and April.

Kanagawa. A town of Japan, situated on the west side of the bay of Tokio, and on the railway from Tokio to Yokohama, 15 miles S. of Tokio and 3 miles N. of Yokohama, from which it is separated by a lagoon. It has a fort and barracks, and is one of the treaty ports. It formerly had a larger foreign trade than any other port of Japan, but with the rise in importance of Yokohama, Kanagawa has declined. Pop. 4000.

Kanaris, Konstantin. A native of the isle of Ipsara, distinguished for his exploits in the Greek war of independence. In 1822 he blew up the Turkish admiral's ship in the Strait of Chios, and the same year performed a similar exploit in the harbor of Tenedos. On the 17th of August, 1824, he avenged the wrongs which his native isle had suffered from the Turks by burning a large Turkish frigate and some transport-ships which were carrying troops to Samos, thereby also saving Samos from the ravages which Chios and Ipsara had endured. In 1825 he formed the bold design of burning the Egyptian fleet then lying in the harbor of Alexandria ready to carry troops to the Peloponnesus, and only the springing up of an unfavorable wind prevented the success of his undertaking. He held important commands under the Greek president, Capo d'Istrias, and in 1848–49 was war minister and president of the cabinet. In 1862, as admiral of the fleet, he took part in the revolution which overthrew the government of King Otho.

Kane, Elisha Kent, was born in Philadelphia, Pa., February 3, 1820, being the eldest of the seven children of the Hon. John K. Kane, United States judge for the Eastern District of Pennsylvania.

Dr. Kane numbered among his ancestors the Kanes and Van Rensselaers, of New York, and the Grays and Leipers, of Pennsylvania,—all well-known and highly-honored names.

As a boy he was small for his age, but very active and daring; noted for venturous escapades and for his skill as a rider,—and though early devoted to experimental chemistry and physics, showing no great fondness for books.

At sixteen, however, he began to work,—his studies being directed with a view to his ultimately becoming a civil engineer. When about to enter Yale College he discovered symptoms of disease of the heart. from which he was never afterwards entirely free. This caused a change in the plan of his education, it being thought better, both on account of the climate and the ability to select his course of study, to enter him at the University of Virginia. Here he pursued the natural sciences — chemistry, mineralogy, physical geography, and geology—under the celebrated Professor Rogers, with the usual course of mathematics and classics. He was a good student in all of them, and they were destined to prove of the utmost value to him in his subsequent labors. He took no degree, his studies being interrupted by an attack of rheumatism involving the heart. He was long almost hopelessly ill, with a slow and doubtful recovery, which left him subject to sudden death at any moment. During his whole after-life he suffered from rheumatism and cardiac disease, except

when in the high northern latitudes, when scurvy, which in his case seemed incompatible with them, took their place. The breaking down of his health caused him to give up the profession of engineering and to take industriously to the study of medicine, following his father's advice, "If he was to die, to die in harness."

In his 21st year, while still an under-graduate, and still in a critical condition of health, he was made one of the resident physicians of the Philadelphia Hospital. In addition to bestowing sedulous attention upon his regular duties, he here made many original experiments upon a subject relating to pregnancy, which was then much occupying the medical mind,—which experiments were of so thorough and scientific a nature as to satisfy the profession both in this country and in Europe. His graduating thesis, on the same subject, was published at the request of the medical faculty of the University of Pennsylvania.

Without the son's knowledge, Kane's father had applied for permission for him to enter the navy as an assistant surgeon, and he was at first much opposed to doing so, but finally yielded and worked hard to prepare for the examination. After passing he told the board of his disability, but he just then seemed so well, and had exhibited such proficiency, that they declined to revoke their favorable decision.

While waiting a vacancy, Dr. Kane was appointed physician to Mr. Cushing's embassy to China, and sailed in May, 1843, in the frigate "Brandywine," for Bombay, there to meet the minister, who was to go overland. The Secretary of the Navy had given permission for him to accept this post without prejudice to his position in the navy.

On the voyage out the "Brandywine" was detained for some time at Rio Janeiro, and Kane seized the opportunity of making a geological reconnoissance of the Eastern Brazilian mountains, occupying his time while at sea in studying navigation and languages. Mr. Cushing was delayed for a long time by the burning of the steam-frigate "Missouri" at Gibraltar, and the "Brandywine" waited at Bombay, Kane making several extended trips, and even going as far as Ceylon and there joining in an elephant hunt.

When the "Brandywine," with the embassy, at length reached Macao, Kane found his commission there waiting for him, but he continued attached to the commissioner's staff until July, 1844, when the treaty was signed.

With Mr. Cushing's sanction he had, in the mean time, gone to Luzon, traversed that little-known island to its Pacific shores, explored the asphaltic lakes, and descended, with extreme labor and peril, to the bottom of the crater of the great volcano of Jael, and, in consequence, nearly lost his life at the hands of the savages, who resented his exploration of the mysteries which they worshiped. Only one person had before attempted this perilous feat, and he was unsuccessful.

Upon Mr. Cushing's return to the United States, Kane resigned his place in the embassy, and intended to resign from the navy, with a view to practicing in Whampoa until he had amassed a sufficient sum to enable him to carry out a darling scheme,—the exploration of the remoter parts of Eastern Asia. After a short time, however, he broke down with fever and was obliged to change the climate.

By way of Singapore and Ceylon he reached India, when he traveled up the country and made an ascent of the Himalayas. From India he passed through Persia and Syria to Egypt, ascending the Nile, and having a number of adventures, among others, a fight with a party of Bedouins, losing all his luggage, and receiving a wound in the leg. This necessitated a return to Alexandria for treatment, during which he suffered a nearly fatal attack of plague; his convalescence from which was rendered doubly tedious by the annoyance caused by the loss of some prized collections which he had sent down the river in a native boat.

As soon as he was able to travel he set out for Greece, which country he explored, mostly on foot. Thence he visited Italy, Germany, and Switzerland, examining glaciers, and forming theories as to ice action, which he was destined to put to practical use. From Switzerland he went to Paris, and while there endeavored, by correspondence, to obtain permission from the Spanish government to practice his profession in Luzon, with a view to further exploration there, but in this he failed.

He now returned to Philadelphia, and, at the earnest solicitation of his family, engaged for one winter in professional occupations, with fair prospects. At this time he would have resigned from the navy had there not been a prospect of hostilities with Mexico; and when war with that country broke out, he at once applied for duty. Instead of being sent to Mexico, however, he was, in May, 1846, ordered to the coast of Africa, in the frigate "United States," Commodore Read.

During his visit to Brazil Kane had met, and put under obligations, the great slave-trader, De Souza, who had given him letters to his agents in Africa. These now proved useful, and he visited most of the slave-factories from Cape Mount to the Bonny River, and even accompanied (with Commodore Read's permission) a caravan from one of De Souza's factories, which carried a present to the king of Dahomey.

Some months after this he was prostrated by a severe attack of the coast fever, and in March, 1847, it was found necessary to invalid him home, from Liberia. Kane always maintained that this illness was the most shattering of the many which he experienced.

By the time he had partially recovered the American army was in possession of the city of Mexico, but Col. Childs was besieged in Puebla, and communication with the coast was much interrupted. An important dispatch had been three times sent to Gen. Scott, and no answer had been received. Just then Kane appeared in Washington, highly recommended, and anxious for any service in which he could distinguish himself; and the President resolved to confide the verbal message to him, as well as important written orders.

He set out in November, sailing from New Orleans. The steam-transport which carried him was nearly lost in a severe "norther," the passengers being obliged to bail the vessel with camp-kettles; but they at last succeeded in reaching Vera Cruz. From this point he went

as far as Perote with a detachment of American troops; and as they went no farther he then joined a renegade spy company, under the command of the notorious Col. Dominguez.

On the 6th of January, 1848, the escort encountered, near Nopaluca, a band of Mexican guerrillas, who were escorting some Mexican officers to Orizaba.

A sharp engagement at once ensued, the spy company fighting "with ropes round their necks," and so desperately that Gens. Gaona and Torrejon, Col. Gaona, 2 captains and 38 men were taken prisoners.

In the charge Kane was wounded and had his horse killed. Gen. Gaona, who was also wounded, surrendered to Kane, who had great difficulty in preventing the murder of his prisoner by the renegades; and then, in spite of his own condition, had to act as surgeon to the general and other wounded. After this adventure Kane remained for a long time ill at Puebla, from the effects of his injury and from typhus fever, and his life was saved, he always declared, by the attention and nursing he received from the grateful family of Gen. Gaona, who were residents of the town.

When Kane finally reached home he was presented with a handsome sword by some of the foremost citizens of Philadelphia.

In the succeeding year he was attached to the U. S. ship "Supply," in which he visited Lisbon and the Mediterranean, as well as Rio Janeiro. During this cruise he had another dangerous illness, nearly losing his life from lock-jaw. Indeed, his whole life seems to have been a struggle against disease of some kind, which renders his wonderful energy and industry the more remarkable.

Having passed his examination for promotion, and while serving in Mobile Bay upon the coast survey, he was, in 1850, upon his urgent application, appointed to the United States Grinnell Expedition; and, in two days after reporting at New York, found himself on his way to the extreme north. The vessels, supplied by the liberality of Mr. Henry Grinnell, were two hermaphrodite brigs,—the "Advance," of 144 tons, and the "Rescue," of 91 tons. Kane was medical officer of the "Advance."

Lieut. De Haven, who commanded the expedition, had had some experience in the Antarctic, under Wilkes, and was an excellent officer, with qualities peculiarly fitting him for his arduous duties.

The year 1850 was prolific in Polar expeditions, no less than 10 British vessels being in search of traces of Franklin, beside a land-party under Dr. Rae.

Twenty thousand pounds sterling were offered for the discovery and effectual relief of Franklin's party, but the officers and men of the American expedition signed a bond not to claim the reward in case of success.

Kane started on the voyage in very indifferent health, and was so prostrated by sea-sickness that De Haven urged him to go home from Greenland, fearing his ability to endure the necessary hardships of the cruise. This he could not be persuaded to do; and his health improved when the real work of the expedition began.

In the passage up Wellington Channel, De Haven saw and named Grinnell Land, which was named Albert Land by Penny, eight months afterwards. Very considerable discussion arose afterwards about this point, but the prior discovery of De Haven was at last allowed by geographers, greatly through the exertions of Kane, who became the historian of this eventful voyage, which occupied 16 months, during nine of which the vessels were ice-locked and drifting.

In 1852, before the book was fairly through the press, Kane was off to the Polar regions again, —this time in command. Mr. Grinnell again gave the "Advance," in which Kane placed the generous donor's name much farther north than the previous expedition had done.

The funds for this expedition were derived partly from the government, which contributed ten naval seamen and their rations, and instruments, books, and medical stores. The American Philosophical Society, the Smithsonian Institution, the Naval Observatory, and the Naval Medical Bureau also added to the rather meagre outfit, while Kane himself contributed his pay and the proceeds of a number of lectures delivered by him upon Polar Exploration. He also received contributions from private persons, chief among whom was Mr. Peabody, who gave $10,000.

There was no Congressional aid. Mr. Kennedy had promised certain assistance within his own powers, and when he left the Navy Department his successor, Mr. Dobbin, though lukewarm, would not undo his predecessor's work.

Just as the time for sailing came Kane had a violent attack of inflammatory rheumatism, but he persevered, was carried on board, and in good time reached Upernavik.

On July 25, 1853, having completed his purchases of furs and dogs, and engaged his Esquimaux, he sent off his last letters and plunged into the unknown regions of the North. He had full faith in the survival of some of Sir John Franklin's people; but while he took every means of inquiry in regard to them, he was also careful to keep up the various observations which he was so competent to make.

He spent two winters in the ice, having a more than usually severe experience of the Arctic winter. In June, 1854, the brig then ice-bound in Rensselaer harbor (78° 37′ 10″ N., and 70° 40′ W.), Kane and Sontag, the astronomer, being sick with scurvy, and Dr. Hayes, the surgeon, snow-blind from a survey of Grinnell's Land, Kane sent one of his petty officers (Morton) to 81° north to look for the open Polar sea. Morton brought back the report of having seen such a body of open water,—which has ever since provoked so much discussion and comment.

Far exceeding all other trials during the expedition was his search, in March, 1855, for a sledge-party which became exhausted upon the ice during an unusually severe storm, when the thermometer reached 78° below freezing. Fortunately, the party was found and rescued.

By the second winter of the absence of the expedition great anxiety concerning it began to be felt, especially as the first winter had been a severe one, and it was known that the outfit was, in some respects, deficient. Congress was memorialized, and public opinion favored an expedition of relief. By authority of Congress such an expedition sailed in the early summer, well provided, and well officered and manned. The vessels were the propeller "Arctic" and the bark

"Release," under command of Lieut. Hartstene, U. S. Navy, who made a request to the Secretary of the Navy that, in case they did not return within the expected time, no expedition should be sent in search of them, "to avoid further risk of human life."

After a tour of Baffin's Bay, encountering heavy ice, Hartstene picked up the adventurers of Kane's party, who were upon their return to civilization. They had abandoned their vessel, hopelessly ice-bound, and accomplished their own delivery by means of a perilous journey over the ice, bringing their own boats with them on sledges, and making a trip of 1300 miles through Smith's Sound and Melville Bay. They were found at Lievely, on the eve of taking passage in a Danish vessel for Europe. Hartstene took them on board, and they reached New York October 11, 1855, after an absence of thirty months.

Kane at once set about his interesting and complete work, entitled "Arctic Explorations: The Second Grinnell Expedition in Search of Sir John Franklin, 1853–54–55."

Kane's health, always wretched, now steadily failed,—as he himself thought from the combined effects of rheumatism and the scurvy taint. But he worked early and late to get his charming book finished, of which he said, "poor as it is, it has been my coffin." On the contrary, it is his best monument.

The admirable illustrations of this work are all from sketches by himself, afterwards worked up by the distinguished marine painter, Hamilton, who thought very highly of them; and Blackwood and other reviews of the time praised these sketches made in a killing temperature by a sick man, with mittened hands, upon a companion's shoulders. His book was a tremendous success, the copyright upon the first year's sales amounting to $65,000.

Kane fully intended, if he ever rallied sufficiently, to publish for "reputation's sake," either through the government or the Smithsonian Institution, a scientific work upon ice.

No public recognition of his services was ever given by Congress; not even the extra pay and emoluments usually voted to such explorers. Secretary Dobbin referred to the expedition (which he had no hand in promoting) in his annual report, remarking that "he had advanced far beyond his intrepid predecessors," and especially remarking his "miraculous and successful journey over the ice in open sledges for eighty-four days."

A gold medal was, indeed, ordered by Congress, but not until after his death. But from other sources the recognition of his services came in thick and fast. He received the gold medal of the Royal Geographical Society with favorable mention—a high honor: the queen's medal for Arctic explorers—and a testimonial from the British residents of New York. The Legislatures of New Jersey, Pennsylvania, and Maryland also gave him a vote of thanks for his exertions.

The principal results of Kane's expedition may be briefly stated as—

1st. The discovery of 960 miles of coast-line, principally by 2000 miles of travel on foot and by dog-teams.

2d. The Greenland coast traced to its northern face.

3d. The survey of the Humboldt glacier.

4th. The discovery and delineation of the coast of Washington Land.

5th. The same accomplished for a large tract forming the northern extremity of our continent.

6th. The discovery of a large channel to the northwest free from ice, and supposed to lead into the open Polar Sea.

By the time the book was published the author's condition of health became most alarming, but his friends still clung to hope of recovery on account of his well-proved tenacity of life. The hand of death was, however, upon him, but, with faint hopes of improvement from change of climate, he sailed for England. Finding himself worse there, he sailed for St. Thomas, and thence managed to reach Havana, where his mother and brother arrived about the same time, to find him paralyzed, but consumed with a dying man's anxiety to die at home. His last wish was not gratified, for he died at Havana, February 16, 1857.

Just thirty-seven years old at the time of his death, Kane had probably accomplished more arduous travel than any other explorer of his day. Rather spare, and below the average height, with large and well-formed head and chest, he had dark-brown hair, gray eyes, and fair complexion. With temperate habits and a delicate eater, he possessed great muscular power, and was a skillful horseman, a capital pedestrian, and a good shot. His self-reliance was perfect, and his power to govern his subordinates was very great. His expedition towards the Pole was a private venture, the men volunteers, and yet in the most perilous and doubtful periods they never questioned his movements or orders. He showed especial capacity in his management of the natives at Etah, an Esquimaux village, converting them from attempting plunder of the vessel and threatening the lives of the white men to a friendly condition, in which they rendered the greatest assistance to the distressed party.

His professional and scientific attainments, undoubtedly great, were held by him as adjuvants to the great object of his life,—exploration, by which he built up the world with fame not only for himself, but for his country.

His remains were brought from Havana to New Orleans, and thence by the river to Pittsburgh, and finally to his native city, being received at all points with the highest honors, civic, military, and Masonic.

He was finally, after lying in state in Independence Hall, interred at Laurel Hill Cemetery, on the banks of the Schuylkill.—*E. Shippen.*

Kanjia. A passage-boat of the Nile.

Karavalla. See CARAVEL.

Karbatz. A common boat of Lapland.

Kava. A beverage in the South Sea Islands, made by steeping the *Piper inebrians* in water.

Kayak. A fishing-boat common in northern regions, probably a corruption of *caïque.*

Kaynard (Fr. *cagnard*, a skulker). An obsolete term for a rascal; a cowardly, good-for-nothing fellow.

Kayu-putih, or Cajeputi Oil. (From the Malay words *putih*, white, and *kâyû*, tree.) An essential oil obtained from the leaves of two species of *Melaleuca.* It is fragrant, and has a strong, pungent taste.

Kazie. A fishing-boat used by the inhabitants of the Shetland Islands.

Keavie. A kind of crab.

KEAVIE-CLEEK. An instrument used for catching the keavie in the north of England.

Keckling. Small rope or strands wound about cables or hawsers to protect them from chafe.

Kedge. A small anchor used for moving a vessel from one part of a harbor to another, or for a temporary anchorage. It is usually carried out in a boat and dropped as required. *To kedge*, to move a vessel by means of a kedge.

KEDGER. An old English name for a fisherman.

KEDGE-ROPE. The rope or hawser used with a kedge.

Keel. The principal timber of a ship, and that which is first placed upon the keel-blocks. It extends from the stem to the stern-post, both of which may be considered as continuations of it. It is composed of several sections scarfed together, each of which should be of sufficient length to allow the fastening of four frames. White oak is used for this purpose in naval vessels. A flat-bottomed vessel or lighter used in the river Tyne, in England, for carrying coal. A *bilge keel* is a construction of keel peculiar to ironclad vessels, extending only a portion of the length of the vessel under the bilges. A *keel-boat* is a kind of freight-boat used on Western rivers. A *false keel* is made of oak planks bolted to the under side of the keel, to protect it from injury in case of grounding. A vessel is *on an even keel* when the draft of water at the bow and stern is the same. The *rabbet of the keel* is the groove which is cut in each side of the keel to receive the edges of the garboard strake.

KEELAGE. The duty or tax which is imposed upon a vessel while in port.

KEEL-BLOCKS. One of the short pieces of timber upon which the keel of a vessel rests when being built, or when in a dry-dock undergoing repairs.

KEEL-DEETER. The woman who sweeps out the keels or coal-lighters used in Newcastle, England.

KEEL-HAULING. A punishment inflicted formerly in the English and Dutch navies for a certain class of offenses. It consisted in hauling the offender under the vessel's bottom from one fore-yard-arm to the other by means of whips, weights being attached to his body to cause him to sink rapidly in the water.

KEELMAN. A bargeman of Newcastle, England. One who manages a keel.

KEEL-PIECE. One of the timbers or sections of which the keel is composed.

KEEL-RAKE. To keel-haul.

KEEL-ROPE. The name of a rope formerly used to keep the limber-holes clear.

KEELSON. A timber of white- or live-oak placed above the keel and bolted to it, which serves to bind the floor-timbers to the keel. *Bilge* or *boiler keelson*, one of the timbers placed in the bilge of a steamer parallel to the main keelson, upon which the boilers rest. *Engine keelson*, one of the timbers upon which the bed-plates rest, and which form the foundation for the engine. *Sister keelson*, a timber placed at the side of the main keelson, and bolted to it. It is also bolted through each timber to the garboard strake.

KEELSON, RIDER-. A timber bolted on top of the main keelson, sometimes called *capping;* the term *rider* is used generally when an increase of strength is required,—such as an additional timber or timbers which are not included in the framing of the ship.

KEEL-STAPLE. A large staple used in fastening the false keel to the main keel.

Keeling. A kind of small cod.

Keep a Good Hold of the Land. To keep the land in plain sight.

Keep a Good Offing. To keep at a safe distance from the land.

Keep a Watch. To be in charge of the deck, or to be on duty with the watch.

Keeper. A jam-nut, set-screw, or other device used to prevent a nut working off or key drawing.

Keep Full for Stays. An order to the helmsman, by which the vessel may have greater speed previous to tacking, or going into stays.

Keep Her Own. Said of a vessel when her speed against a current is equal to the force of the current, or when she holds her position.

Keep Her Way. To retain speed through the water after the vessel is deprived of her motive-power, as by stopping the engines or reducing sail.

Keep Off. To keep a vessel away from the wind. To keep at a distance.

Keep the Land Aboard. To keep within sight of the land and at a moderate distance from it.

Keep the Sea. To retain mastery over the sea. The importance of controlling the English Channel was evident during the reign of Henry V., when his successes against the French depended in a great degree upon the possession of the Channel, or "Narrowe Sea." In lieu of naval vessels, merchants were required to "keepe the sea" with their ships, and from May, 1406, to September, 1407, the British coast was guarded in this manner.

Keep Your Luff. An order to the helmsman to keep close to the wind, when close-hauled.

Keg. A small cask. (*Eng.*) A cant word, meaning to irritate.

Kelk (*Eng.*). The roe of fish. A large stone. To stone.

Kelp. A common term for sea-weed, or vraic, which consists of different species of *Fucus*. In a strict sense the term kelp is confined to the produce of sea-weeds when burned. These being first dried in the sun, are burned in shallow excavations at a low heat. About 20 or 24 tons of sea-weed yield one ton of kelp, which, as met with in commerce, consists of hard, dark-gray, or bluish masses, which have an acrid, caustic taste, and are composed of chloride of sodium, of carbonate of soda (formed by the decomposition of the organic salts of soda), sulphates of soda and potash, chloride of potassium, iodide of potassium or sodium, insoluble salts, and coloring matter. It used to be the great source of soda (the crude carbonate), but as this salt can now be obtained of better quality and less cost from the decomposition of sea-salt, it is prepared in far less quantity than formerly. Kelp is largely used as a source of iodine, and it is said that a ton of good kelp will yield about 8 pounds of iodine, large quantities of chloride of potassium, and additionally, by destructive distillation, from

4 to 10 gallons of volatile oil, from 4 to 15 gallons of paraffine oil, 3 or 4 gallons of naphtha, and from 1½ to 4 hundred-weight of sulphate of ammonia.

Kelper (*Eng.*). An imaginary being or spirit believed by the ignorant and superstitious to haunt certain localities and warn people of danger.

Kelt. The name in Scotland for a salmon after spawning.

Kelter. Order or condition.

Kemstock. An old name for a capstan.

Ken. To recognize; to know.

Kennet. See Kevel.

Kenning by Kenning. An old expression among whalers, denoting that a man received pay according to the value of his services.

Kenning Glass. An obsolete term for a spy-glass.

Kenspeckle. To mark in such a way as to be easily recognized.

Kentledge. Pig-iron used for ballast.

Kentledge Goods. Heavy portions of the lading of a vessel that can be used as ballast.

Kent-purchase (a corruption of *cant-purchase*). A tackle used by whalers to cant or turn the whale during the operation of flensing.

Kepler's Laws. Three natural laws discovered by Kepler,—1st. Each of the primary planets revolves in an ellipse, having one of its foci in the sun. 2d. That equal areas are described in equal times. 3d. That the squares of the periodic times of the planets are proportional to the cubes of their mean distances from the sun.

Kerfe. The notch or slit made in cutting or sawing timber.

Kerguelen's Land, or Island of Desolation. A rocky island about 100 miles long and 50 broad, lying in the Antarctic Ocean, the latitude and longitude of its southern extremity, Cape George, being 49° 54′ S., and 70° 12′ E. It was discovered in 1772 by the French navigator Ives Joseph de Kerguelen Tremarec, and is said to contain coal fit for steamships.

Kerguelen's Land Cabbage (*Pringlea antiscorbutica*). The only known species of a very curious genus of plants of the natural order *Cruciferæ*, and found only in Kerguelen's Land. It is very useful to the crews of whalers and other vessels which have occasion to touch there. It has a long, stout, perennial root-stock, and a *bolled* head of leaves very similar to those of the common garden cabbage. The root-stocks have the flavor of horse-radish. The dense white heart of the cluster of leaves tastes like mustard and cress, but is coarser. The whole foliage abounds in a very pungent, pale-yellow, essential oil, which is confined in vessels that run parallel to the veins of the leaf. This plant was first discovered and brought into notice by Capt. Cook. It is used by voyagers, boiled either alone, or with beef, pork, etc., and is highly valued by them for its antiscorbutic properties.

Kermes. Dried bodies of the females of the *Coccus ilicis*, an insect found near the shores of the Mediterranean. They are valuable as a dye.

Kert. An obsolete term for chart.

Kertch. A fortified town of Russia, in the Crimea, on the peninsula of Kertch. Lat. 45° 20′ N.; lon. 36° 28′ E. In 1827 it was declared a free port. It has a navy-yard and foundry, and a large export trade in stone, fish, hides, grain, etc. Pop. 23,000.

Kertk, Admiral Sir David, commander of a successful expedition against Canada; had been a master-mariner at Dieppe, France, but entered the English naval service in the reign of Charles I. Placed in charge of a formidable force, and accompanied by his two brothers, he arrived at Tadoussac, in midsummer, 1628, and after destroying the stores, etc., sent a summons to Champlain to surrender, which was refused. Kertk, thinking Quebec strongly fortified, after capturing a French convoy on its way to Quebec, went home. In July, 1629, he returned again, demanded a surrender; and Champlain, being weaker than ever, capitulated. Kertk, leaving his brother Lewis in command of the city, proceeded to England, taking Champlain and others with him as prisoners of war. He afterward captured Cape Breton, which was recaptured by Capt. Daniel. These events took place two months after peace had been concluded between France and England, and were not recognized by either nation. As late as 1645 he was on the coast of Newfoundland.

Ketch. A small vessel formerly used as a yacht, and still later as an armed vessel. It was rigged with two masts, which were placed in nearly the positions of the main- and mizzen-masts of a ship, thus leaving a clear deck forward of the mainmast. On this account they were greatly used as bomb-vessels.

Kettle-bottom. A name applied to a vessel with a flat floor.

Kettle-net. A net formerly used in catching mackerel.

Kettle of Fish. A person makes a *pretty kettle of fish* when he has involved himself in difficulties by bungling.

Kevel. A large cleat for belaying ropes, usually called a *cavil*.

Kevel-head. The upper end of a timber used for belaying ropes.

Keveling. A name on the English coast for the skate.

Key. A wooden pin driven into a scarf to prevent the pieces from slipping. An iron pin driven through a hole in the end of a bolt to prevent it from slipping out of its socket. A piece of metal made tapering, and used to secure wheels, pulleys, couplings, etc., on shafts, and to tighten journal-boxes. A device used for closing and breaking an electric circuit. A wharf or pier (see Quay). The low islands of the West Indies are called keys, or *cays*, the term being derived from the Spanish word *cayo*.

Keyage. The charges for the use of a key or quay.

Key-bolt. One secured by a cotter or wedge.

Keyle. See Keel.

Key-model. A model of a vessel formed by different layers of board fastened together by keys and screws.

Key West. A port of entry and capital of Monroe County, Fla., on Thompson's Island, in lat. 24° 32′ N., lon. 81° 48′ W. It has a safe harbor, of which the entrance is protected by Fort Taylor. Vessels drawing 20 feet or more of water can be easily admitted. It has extensive manufactories of cigars, important sponge-fisheries, and some salt-works. Pop. 5000.

Khalishees. Native East Indian sailors.

Khania. A fortified seaport and the principal commercial town of Crete. Its fortifications, built by the Venetians, are inferior to those of Candia, but its port is the finest in Crete, capable of holding many vessels. The town has an arsenal, docks, soap-factories, etc. Pop. 8500.

Khizr. An East Indian sea-god.

Kibblings. Portions of a fish which are used for bait in the vicinity of Newfoundland.

Kick. To recoil. A common term used in relation to fire-arms.

Kick the Bucket. An irreverent expression for dying.

Kid. A small wooden tub. A slang phrase for a young child. A heap of bushes planted on a beach to gather sand, gravel, etc., to prevent the washing away of the land.

Kidders. A fence formed of stakes in a river for catching fish. Also an obstruction to vessels.

Kidleywink (*Eng.*). A low beer-shop.

Kidnap. To carry off a human being by force or artifice.

Kidney. Kind or habits, as "men of the same kidney."

Kiel. A seaport town of Holstein, Prussia, on a fine bay of the Baltic. It has manufactories of iron, goods, and machines, tobacco, starch, and sugar, a good harbor, ship-building, a great navy-yard, arsenals, docks, and fortifications. Pop. 41,000.

Kiftis. Passenger-boats used on the rivers of India.

Kihaia. A Turkish officer of customs of high grade.

Kilderkin. A liquid measure containing two firkins, or from 16 to 18 gallons.

Kill. A narrow channel or arm of the sea.

Kill-devil. Spirits of poor quality; sometimes called *lightning* from the rapidity of its effects.

Killer. The name given to the grampus by whalers on account of its ferocity.

Killie-leepie (*Scotch*). The common sand-piper.

Killock. A small anchor for a boat, or a stone used as an anchor.

Kilty, A. H., Rear-Admiral U.S.N. Born in Maryland. Appointed from Maryland, July 4, 1821; first cruise, "Franklin," 74, Commodore Stewart, Pacific, 1821–24; store-ship "Decoy," West Indies, sloop "John Adams," Pensacola Station, frigate "Constellation," 1825–27; Brazil Station, frigate "Hudson," sloop "Boston," 1828–29; surveying coast of Louisiana, 1830–31.

Promoted to passed midshipman, April 28, 1832; schooner "Grampus," West Indies, 1832–34; receiving-ship "Sea-Gull," Philadelphia, 1835–36.

Commissioned as lieutenant, September 6, 1837; sloop "John Adams," East India Squadron, 1838–40; present at the attack on Qualla Battoo and Muckie, by Commodore Reid; "Columbus," 74, Mediterranean and Brazil, 1843–44; frigate "United States," coast of Africa and Mediterranean, 1846–49; rendezvous, Baltimore, 1851–52; receiving-ship "North Carolina," New York, 1854–55.

Commissioned as commander, September 14, 1855; commanding rendezvous, Baltimore, 1860; ordered to St. Louis, 1861, to aid in organizing naval flotilla under Foote; took command of gunboat "Mound City," and was engaged at Island No. 10 and Fort Pillow. The "Mound City" being sunk in the latter engagement, she was raised, repaired at Mound City, and rejoined the flotilla.

In June, 1862, was placed in command of an expedition to White River, Arkansas; on the 17th, attacked Fort St. Charles, about 100 miles from the mouth of the river, and, with the aid of military force under Col. Fitch, took it; but near the close of action a shot entered the steam-drum of the "Mound City," and the escape of steam caused the death of more than a hundred officers and men, the commanding officer receiving a severe scald, which caused the loss of his left arm.

Commissioned as captain, July 16, 1862; ordnance duty, Baltimore, 1863; command of iron-clad frigate "Roanoke," North Atlantic Squadron, and receiving-ship "Vermont," 1864–65.

Commissioned as commodore, July 25, 1866; command of Norfolk Navy-Yard, 1867–70. Retired November 25, 1868.

Commissioned as rear-admiral, July 13, 1870.

Died November 10, 1879.

Kimball, Sumner Increase, general superintendent of the U. S. Life-Saving Service. He was born in Lebanon, York County, Me., on September 2, 1834. He graduated at Bowdoin College in 1855, clerking and teaching school in the vacations to obtain funds to pay for his college course. Immediately after graduating, he commenced the study of law with his father, the Hon. Increase S. Kimball, one of the most distinguished lawyers in the State of Maine. He discontinued his law studies after a year, to occupy the position of commission clerk in the office of the Secretary of State at the capital of Maine. This position he resigned in the spring of 1857, and resumed his legal studies. He was admitted to the bar in 1858, and at once commenced the practice of his profession at North Berwick, Me. In September, 1859, he was elected representative to the State Legislature as a Republican, and although the youngest member of the house, took high rank in that body. In January, 1860, he accepted a first-class clerkship in the office of the Second Auditor of the Treasury, and successively passed through all the grades until he became chief clerk, now called deputy auditor. His recognized ability as an organizer in that office, which the war had increased from a *personnel* of 21 to more than 500, caused the Secretary of the Treasury, in 1871, to invite him to take charge of the Revenue Marine Service, which at that time was in a very unsatisfactory condition. This trust he accepted, and under his administration the service was almost revolutionized, the results appearing in a great diminution in the running expenses and the increase of its efficiency fivefold. He has twice been offered the position of chief clerk of the Treasury Department, which he declined. He consented, however, to act in that capacity during the short administration of Secretary Morrill, retaining charge at the same time of the Revenue Marine and Life-Saving Service. Connected with the Revenue Marine Service he found the nucleus from which he has developed the present Life-Saving Service. The establishment then merely consisted of a few buildings confined to the coasts of Long Island and New Jersey, designed for the storage of surf-boats and a few other meagre life-

saving appliances, intended for volunteer use on occasion of shipwreck by the local fishermen and wreckers. Both houses and apparatus had fallen into a state of dilapidation through neglect and depredation. There was no organization nor system connected with the establishment, and it was productive of comparatively little benefit. After personal inspection, Mr. Kimball took measures for the creation of an efficient service upon these coasts, and the proper appropriation having been procured, he increased the number of stations, and organized an effective corps of surfmen to man them. He furnished the stations with the latest life-saving appliances, and introduced the patrol system, by which the entire coast is placed under constant watch, and the immediate discovery of wrecks secured. The result of this organization for the first year was striking, not a life being lost by shipwreck upon either of these dangerous coasts. This fact caused the extension of the service to other portions of the Atlantic coast, where similar success followed, the final result being the formal establishment of the service upon all the coasts of the country, both ocean and lake, by the act of June 18, 1878, which also organized the Life-Saving Service into a distinct bureau, with Mr. Kimball at its head, detaching it from the Revenue Marine.

King Arthur (*Eng.*). A game sometimes played by sailors in warm climates. One, representing the king, allows water to be dashed upon him until another, by laughing, is forced to take his place.

King-crab. The *Limulus polyphemus*, a large crustacean in the form of a horse's foot. It is common in the West Indies.

King-fish. A large flat fish (*Lampris guttatus*) showing brilliant colors.

King-fisher. The *Alcedo ispida* of Europe and the *Alcedo alcyon* of America. It is a bird of gay plumage, inhabiting the vicinity of lakes and streams, and lives upon fish.

King's Bargain (*Eng.*). Refers to a sailor's merits, whether good or bad.

King's Bencher (*Eng.*). A man of many words and little work. A sea-lawyer.

King's Hard Bargain (*Eng.*). A worthless fellow.

King's Letter Man (*Eng.*). A former class of officers in the English navy, ranking with midshipmen, and holding a promise or letter that good conduct should be rewarded with a lieutenant's commission.

King's Own (*Eng.*). A term applied to all articles issued from the royal store-houses or magazines, and marked with a broad arrow.

King's Parade (*Eng.*). The quarter-deck.

Kingston, Ontario, is situated at the outlet of Lake Ontario, in lat. 44° 12′ N., lon. 76° 41′ W. The harbor is formed at the mouth of Cataraqui River, which here enters the lake. The west side is bold, and shipping of any size can lie here in safety. The city contains manufactories of iron-castings, machinery, steam-engines, locomotives, etc. Ship- and boat-building is carried on to a great extent, and vessels for both lake and ocean navigation are fitted out. Pop. 13,000.

Kingston, the principal commercial city and seaport of Jamaica, has a very fine harbor, which is a landlocked basin available for the largest ships, and is defended by several forts. Lat. 17° 58′ N.; lon. 79° 47′ 30″ W. Pop. 34,500.

Kingston. A shark (*Aquatina angelus*) having broad lateral fins, like a ray, whence it is also called *shark-ray*, *angel-fish*, etc. It is found in the North Atlantic. (Written also *king's-stone.*)

Kingston Valve. A valve for closing an orifice in a ship's side or bottom below the water-line. It is a conical-faced valve, fitted to a suitable seat and opening outwards, and so arranged that the outside pressure of water will close it when the force holding it open is removed. It is manipulated from the inside of the vessel by means of a stem passing through a stuffing-box.

Kink. A short curl or loop in a rope, and occasioned by an excess of lay or twist.

Kinkling (*Eng.*). A periwinkle.

Kinn (*Scotch*). Head or promontory.

Kintlidge. See KENTLEDGE.

Kippage. An obsolete term for the crew of a vessel.

Kipper. A salmon in the state of spawning. The word *kipper* originally denoted a salmon directly after the spawning season, and as fish in this state are not good for use while fresh, they were usually cured and hung up. Hence the word which properly denotes a spawning salmon came to be generally used for one that is salted and dried.

KIPPER-TIME (*Eng.*). The months during the year when the taking of salmon is prohibited.

Kismiss. A seedless raisin raised in India.

Kist. A Scotch pronunciation of chest.

Kit. A tub or basket used for fish. An outfit, either of tools required in a particular trade, or of clothing.

Kite. A fish of the genus Rhombus (*R. vulgaris*). Called also *brill.*

Kites. Lofty sails. See FLYING KITES.

Kittiwake. A gull found in high northern latitudes (*Larus tridactylus*).

Kitty-witch. A small kind of crab.

Kleg. A fish of the genus *Gadus barbatus.*

Kleptes. The Greek word for robbers. The term was applied to the corsairs of the Archipelago.

Klick-hooks. A peculiar kind of hook for catching salmon.

Klinker. A lighter or boat used on the coasts of Denmark and Sweden.

Klippen. A German word meaning cliffs.

Knag. The rocky summit of a hill. A knot in wood.

KNAGGY. Rough and knotty. Bad tempered.

Knap (Anglo-Saxon *cnæp*, a knob or button). The top of a hill.

Knar. A knot in wood.

Kneck (*Eng.*). The twisting of a rope as it is running out.

Knee. A timber of natural growth with two arms, nearly in shape of a right-angle, or a heavy iron bar bent to a similar shape. They are used to connect different beams and timbers in ship-building, and are named from the position in which they are placed. A *hanging* knee secures a deck beam to the side of the vessel, and is placed in a perpendicular position under the beam. A *lodging* knee is secured to the forward side of the beam, and to the vessel's side in a horizontal position, and a *lap* or *bosom* knee to the after side of the beam. A *dagger* knee is placed obliquely against the side of a vessel when

it would otherwise interfere with a gun-port. The *stern-post* knee is placed in the angle which is formed by the stern-post and keel.

KNEE-TIMBER. Timber that can be used for knees.

Knettar (*Eng.*). The string by which the mouth of a bag is secured.

Knife. Formerly used in the sense of sword or dagger.

Knight-heads. The timbers in a wooden ship which are bolted next to the apron or dead-wood, one on each side; they extend upward on each side of the bowsprit, the apron or dead-wood being sided large enough to admit of the bowsprit's being placed between the knight-heads.

Knittles. The small cords formed from the outside yarns of a rope with which a rope's end is pointed or grafted. See NETTLE.

Knocker. The name given to a kind of cockroach, from the noise that they make.

Knock off. To stop; to desist; as, to *knock off* talking.

Knoll (Anglo-Saxon *cnoll*). The round top of a hill, or the highest part of a shoal.

Knopp. See KNAP.

Knot. A bunch made in a rope or cord, either for ornament or use. They are made in the ends of ropes to prevent them from slipping or unreeving, by unlaying the strands and interweaving them in regular order; and are named either from the manner in which they are made, or the use to which they are applied, as *stopper* knot, *diamond* knot, *double-diamond* knot, *single* and *double wall* knots, etc. The ends of ropes are bent together by *square* knots, *single* and *double bends*, *fisherman's bend*, *Carrick bend*, etc. The log-line is divided into *knots*, each of which bears the same proportion to a mile as 30 seconds does to an hour. Hence, in speaking of a vessel's speed, *knots* are used, meaning nautical miles.

Knuckle. An angle made on some timbers either at the bow or the stern, such as at the counter- or stern-timbers, and the bulwarks which fall back from the line of the forward cant-timbers by a quick reverse of the shape, like a knee.

KNUCKLE-JOINT. A method of coupling shafts whose axes are not in the same straight line, but meet in a common point, by means of which power can be transmitted obliquely.

KNUCKLE-RAIL. A rail worked at the height of the knuckle.

KNUCKLE-TIMBERS. Those top-timbers in the forward or after body whose heads stand nearly perpendicular, or tumble home.

KNUCKLE-UNDER. To submit.

Kochab. The name of the star β *Ursæ Minoris.*

Koff. A Dutch coasting-vessel, fitted with sprit-sails, flying topsails, and jibs.

Koond. A cistern in India.

Kopeck. A Russian coin, .01 of a rouble; in value about two-thirds of a cent.

Korocora. A vessel with a high curved stem and stern, used by the Malays.

Koster. A kind of sturgeon.

Kota. Turpentine of East Indian production.

Koupang, or **Chobang.** A Japanese gold coin, equal in value to $3.57.

Kowdie, Kaurie, or **Cowdie.** A coniferous tree of New Zealand, valuable for spars (*Dammara Australis*).

Krabla. An Archangel whaling-vessel.

Kraken. A fabled Norwegian sea-monster of enormous size.

Krang, or **Kreng.** The carcass of the whale after the blubber has been removed.

Kreel, or **Creel.** A frame for taking salmon in Scotland. A basket used by anglers.

Kris, or **Crease.** A large dagger used by the Malays.

Kroo-men. A tribe of Africans on the west coast. They are employed on board of vessels for boat-service, where exposure to the heat of the sun would be injurious to foreigners.

Kyar, or **Coir.** Fibre of the cocoanut and the cordage made therefrom in India.

Kyle. A Scotch name for a small bay or creek.

L.

L. The three L's refer to lead, latitude, and look-out. The frequent use of the first, a correct knowledge of the second, and the faithful performance of the latter will generally insure safety in the vicinity of the coast. Of the letters used in the log-book to indicate the state of the weather, *l* denotes *lightning.*

Labarum. The standard borne before the Emperor Constantine, and afterwards applied to any flag or standard.

Labor. The heavy straining of a vessel caused by violent motion in a gale.

LABORSOME. Having a tendency to labor, on account of the cargo or fault in construction.

Labridæ. A family of osseous fishes, ranked by Cuvier in the order *Acanthopterygii*, by Müller in his artificial order, *Pharyngognathi.* The fishes of this family may be recognized by their oblong, scaly body, a single dorsal fin supported in front by spines, each of which is generally furnished with membranous appendages; the jaws are covered with fleshy lips, and the pharyngeal bones are armed with numerous and strong teeth, so disposed as to be especially adapted for crushing hard bodies and vegetable stems. The most valuable of the family is the Tautog (which see).

Labrus. A genus of fishes, several species of which are characterized by an elegant and regular oval form and beautiful colors; the wrasse.

Lace. To fasten with a cord or lacing. To beat or flog. *Gold lace* sewed upon the cuff denotes the rank of naval officers.

LACING. The cord or rope which is passed

through eyelet-holes in a sail to secure it to a stay, or to secure the edges of awnings or sails to each other.

Lace-piece. One of the principal pieces which compose the knee of the head in wooden ships; it is the upper piece, and the figure-head and head-rails are secured to it.

Lacerta. See CONSTELLATION.

Laches (Fr. *lache*). A term in law meaning negligence.

Lacquer. A varnish composed of gum-shellac dissolved in alcohol. Used upon lower decks and other unpainted wood-work.

Lacustrine. Pertaining to lakes.

Ladder. A frame consisting of side pieces connected by rounds or steps. A *Jacob's ladder* is made by inserting rounds, at regular intervals, through the lay of two ropes which serve as sides. They are used on lower booms, between the spar-deck and lower rigging, abaft the topgallant-masts when there are no ratlines upon the topgallant rigging, and over the stern of vessels for convenience in getting into or out of boats which are moored astern. Wooden ladders or steps are used for going from one deck to another, and are named from the hatchway or deck to which they belong. An *accommodation* ladder is a stairway extending from the gangway nearly to the water's edge, by which persons can gain access to a vessel from a boat.

Lade (Anglo-Saxon *lladan*). To load. Formerly used in the sense of *throwing out* or *bailing*.

LADEN. The condition of a vessel when loaded.

LADEN IN BULK. A cargo not in packages, but thrown loosely into the hold. Grain and salt are often carried in this manner.

LADING. Cargo.

Ladia. A Russian river-boat or lighter.

Ladle. An instrument for drawing the shell from a gun, or for handling hot shot. A small scoop used for dipping or handling liquids.

Ladron (Sp. *ladrone*). A rogue or thief.

LADRONE SHIP. A name given by the Chinese to a man-of-war or an armed vessel, probably on account of the roving character of armed junks.

Lag. One of the boards or staves forming the covering of the non-conducting material used on steam-cylinders, boilers, and steam-pipes.

LAGGING. The non-conducting covering which is placed upon steam-boilers and pipes to prevent the loss of heat by radiation.

Lagger. An idler or loiterer. (*Eng.*) One who is transported for crime.

Laggin. The extension of a barrel-stave beyond the heads.

Lagoon. A shallow lake connected with the sea. They are usually found on low coasts, or near the deltas of rivers, and also in coral islands where the water is supplied by channels or by the breaking of the surf over the reefs which separate the lagoon from the sea.

LAGOON ISLAND. An island formed by the coral insect, the peculiar feature of which consists of a narrow reef encircling a lagoon.

La Guayra is the principal seaport of Venezuela, on the Caribbean Sea, in lat. 10° 36′ 42″ N., lon. 66° 56′ 30″ W., closely surrounded by high mountains, except to seaward. Its trade is extensive, the chief exports being coffee, cacao, indigo, hides, cotton, etc. The harbor is not a very good one, the continued east winds keeping the water in a constant state of turmoil. The anchorage-ground, in from 6 to 30 fathoms according to distance from land, is very good. The town is defended by forts and batteries. Pop. 7000.

Lag-wood (*Eng.*). Wood from the large branches near the head of an oak-tree.

Laid. A name formerly given to the pullack by fishermen.

Lake. A lake is a large quantity of water contained in a hollow cavity in the earth's surface. Lakes, then, are nearly or entirely surrounded by land. A small lake is called a *pond*, in France an *étang*. A shallow lake near a coast is called a *lagoon*, and such in Ceylon are called *jeels*, and in Prussia *haffs*. Lakes in England are called *water;* in Ireland, *lough;* in Scotland, *loch;* in Italy, *valle;* in Holland, *meer;* in Hanover, Prussia, and Austria, *see*. A shallow lake, filled with vegetation, is called a *marsh*, or *morass*, and a large collection of such in Florida goes by the name of *everglades*. Ponds sometimes become lakes in times of great rainfall, especially in desert districts. Lakes are nearly everywhere abundant, and with them are connected some of the most remarkable phenomena of science. Anciently, many lakes were the habitations of primitive men, who built their villages on piles driven in them, and a tribe of Indians still build such villages in Lake Maracaybo, in Venezuela. Lakes are either salt or fresh. Those that have a considerable outlet are generally fresh, but the lakes of desert tracts are nearly always salt. The most remarkable salt lakes are the Dead Sea, Lake of Tiberias, Sea of Aral, Urumyeh in Armenia, and the Great Salt Lake of Utah. The quantity of salts furnished is frequently important, and bitumen, naphtha, petroleum, etc., are often derived from lakes.

Many lakes occupy the craters of extinct volcanoes, and many are at a great elevation above the sea. In most of the mountain ranges of the world are found such lakes. Others are far below the level of the sea, filling depressions often the result of volcanic, glacier, or earthquake action. Lakes also exist in caverns, far below the surface of the earth. They are often the sources of mighty rivers, and the waters of the Amazon, the Mississippi, and other great rivers find their beginning in small lakes. Lakes are often but the expansion of rivers, and the great American lakes are of this class, as are the Swiss lakes.

The finest scenery is often found near lakes, and the lakes of Killarney and the Swiss and Italian lakes are particularly celebrated for this. Some lakes are doubtless the remains of greater seas, as the Sea of Aral, formerly a part of the Caspian. Large lakes are particularly remarkable for their sudden and terrible storms. In Lake Constance a peculiar swell, called the *ruhss*, sometimes occurs without any apparent cause. Nonnenworth Lake, in the Black Forest, contains an island of floating turf, rising and falling on its bosom. A lake in Tunis completely evaporates during the dry season, leaving an incrustation of salt on the soil, gradually increasing in depth from an inch to a foot towards the centre. In the island of Trinidad is the celebrated Pitch Lake, boiling at its centre. Lake Jordan, in Friesland, is so completely covered by a vegetable growth that a wagon may be driven across it. The Zirkneh See, in Illyria, is

remarkable for emptying its bed in the summer, so that crops may be raised in it, and the holes by which the water leaves are seen, fish appearing with the return of the water. In North India a lake appeared in 1819 after an earthquake. Several lakes contain springs of mineral water, some hot water, and many salt lakes have fresh-water fountains in them. Lake Ala-Kal, in the Hindoo Koosh, contains an island volcano, and Lake Palte, in Thibet, is merely a circular ring about an island.

Switzerland, Finland, Sweden, and the northern half of North America are best provided with lakes.

Lake Ladoga is the largest in Europe. It contains 6300 square miles. It receives about 60 rivers and the waters of 2 other large lakes, Onega and Saima, pouring its waters into the Gulf of Finland by the Neva River. The lakes of Russia are very large.

Lake Baikal, in Asia, is one of the largest in the world, being 400 miles long and 60 broad. It is shallow, but is well stocked with fish and seal. Many of the high plateaus of Asia are evidently the beds of former lakes. Lake Urumyeh, in Armenia, is so salt that a storm covers the shores with foam to a great distance. The Dead Sea, famous in history, is particularly remarkable for the absence of all animal life, owing to its salts and to the petrifying character of its water. It is so salt that storms do not raise waves, and is 1300 feet below the sea, the greatest depression known.

The greatest lakes of the world are the six contained in the St. Lawrence Basin, containing 93,000 square miles, the largest being Lake Superior and the smallest St. Clair. The lakes of Africa are probably nearly as large, and give rise to the Nile, Zambesi, and other large rivers.

The five lakes occupying the plateau of Mexico are remarkable as having been the seat of civilization there. In Tezcuco was the ancient city of Mexico, and in these lakes are now floating gardens, islands of turf of great size, on which gardens are planted.

In South America, Lake Titicaca, 12,847 feet above the sea, was equally remarkable as the seat of Peruvian civilization. A temple on an island in it marks the former seat of Manco Capac, founder of the Inca kingdom.

Australian lakes are remarkable for their want of permanency, being very shallow, and sometimes drying up very suddenly.

Artificial lakes are numerous in Holland. Lake Moeris, in Egypt, was celebrated as having been constructed by one of the Pharaohs to contain and store up the surplus waters of the Nile inundation for a time of need.

France, Spain, and Portugal contain few lakes, and those very small; and the only lakes in Hindostan are the salt marshes near the coasts, called *runns*.—*F. S. Bassett, Lieutenant U. S. Navy.*

Lamantin. An old name for the *manatus*, or *sea-cow*.

Lambasting. The use of a rope's end as an incentive to action. (Probably a corruption of the obsolete word *lambskin*, to beat.)

Lamb's-wool Sky. The appearance of the sky when small circular clouds are seen.

Lamprey, or Lamper-eel. An eel-like fish of the genus *Petromyzon*, having a round, sucking mouth set with numerous minute teeth, and two large teeth on the palate. It was formerly esteemed a great delicacy, and is still eaten. The European sea lamprey is *P. marinus;* the American, *P. Americanus.* The river lamprey is *P. fluviatilis.*

Lamp-shell. A common name for the *Terebratula* of zoology.

Lancaster Gun. See ORDNANCE.

Lance-corporal. A private who performs the duty of corporal.

Lanchang. A Malay proa, or swift-sailing boat.

Land. The earth as distinguished from the sea. The space between the grooves in a rifled gun. The lap of the planks in lap-jointed work. *To land* signifies to set foot on shore, also to place any object; as, "To land a yard on deck." *To make land* means to sight it. *To shut in the land* is to lose sight of it by reason of fog or intervening land.

LAND-BLINK. The peculiar brightness in the atmosphere which is seen in the Arctic regions when in the vicinity of land covered with snow.

LAND-BREEZE. The wind which blows from the land during the night in the tropics. See BREEZE.

LAND-FALL. A good land-fall is made when land is sighted with the bearing and distance previously expected. It is the proof of the correctness of the navigator's work, whereas a bad land-fall would indicate errors in a vessel's navigation, or the effect of unknown currents.

LAND-HO! The cry that is given when land is first seen.

LAND-ICE. Ice that extends out from the shore.

LANDING. A pier, wharf, etc., where passengers are landed.

LANDING-STRAKE. The second strake or plank of a boat from the gunwale.

LANDING-SURVEYOR (*Eng.*). A grade of custom-house officer who superintends the landing-waiters.

LANDING-WAITER (*Eng.*). An officer of customs who attends to the landing and inspection of goods subject to duty.

LAND-LOUPER (*Dutch*). A vagabond or vagrant.

LAND-LUBBER. A sailor's term of contempt for one who lives on shore.

LANDMARK. Any object on shore serving as a guide by which to enter a harbor, or by which the land may be recognized.

LAND-SHARKS. The class of people in seaports who subsist by defrauding sailors of their money.

LAND-SLIP or LAND-SLIDE. The sliding of a quantity of land on the side of a mountain.

LANDSMAN. A rate in the navy which includes persons who have no knowledge of the duties of a seaman.

LAND-TURN. A land-breeze.

Landing-parties. The organization of landing-parties is outlined in the Ordnance Instructions, but the details are left to commanding officers, as they have to be varied to suit the circumstances under which a landing is to be made. In well-organized ships something similar to the following obtains.

For expeditions at a distance from the ship, where the journey has to be performed by water in the ship's boats, what is called the organiza-

tion for "distant service" is followed. The boats are manned by their "fighting crews." Each boat carries, besides, a number of marines or good marksmen to act as riflemen. As supplies and extra ammunition have to be carried, the boats, to be perfectly serviceable, must not be overloaded. Each fighting division of the ship mans two boats, one large and one small one, the officer of the division commanding the section going in the larger boat, one of his aids or a petty officer having charge of the other. In the boats carrying howitzers or machine-guns there is an extra officer, who acts as chief of piece. The boats are all numbered, and are arranged so that when in line the artillery will be on the flanks, and that the two boats commanded by a division officer shall be together. The steam-launch, or cutter, is not assigned a permanent position in the line. This boat is assigned to the commanding officer of the expedition, and carries a machine-gun. In moving long distances she takes the other boats in tow, the latter being formed in column of boats. Oars and sails should be used in the boats when possible, to assist the tow.

The equipment of the boats and men must vary, of course, with the service to be performed. On civilized and armed coasts a boat expedition would rarely be attempted, but on uncivilized or unarmed coasts great advantages are derived from them when properly carried out.

We will assume that an expedition is to be sent from a ship of the class of the "Pensacola," to operate 50 miles up a river against an Indian village. The "Pensacola" is provided with a steam-launch, a sailing-launch, three cutters, a cutter-barge, two whale-boats, a gig, and two dingeys. It has been decided, for example, that it will be safe to send all the boats away from the ship; if it had not, one or more divisions, with their boats, could have been left behind. It is supposed that the raid can be accomplished in two days, but an extra day's stores are to be carried in case of accidents. The boats are assigned to the divisions as follows: 1st division, sailing-launch and 3d cutter; 2d division, 1st cutter and 1st whale-boat; 3d division, 2d cutter and 2d whale-boat; 4th division, barge and gig; hospital-boat, 1st dingey, the 2d dingey being left for ship's use. The steam-launch is manned from the master's division. The sailing-launch and 1st cutter carry howitzers, the steam-launch, a Gatling.

The boats are supplied for pulling and sailing, and are furnished with anchors, or grapnels, and cables. Provisions (cooked) are carried for three days; the coffee roasted and ground, ready for use. Water is carried for five days. The howitzers are supplied with 80 rounds of assorted ammunition; more should be carried if stowage room can be found. The field-carriages are taken if the guns are to be landed. It will generally be found best to take one at least. Spare sponges and rammers are necessary. The men are armed with rifles and sword-bayonets, except the 8 lower numbers of the guns' crews, who are armed with cutlasses. Each man carries 40 rounds of ammunition, and 1000 rounds of spare ammunition is carried in each boat. Pea-coats and blankets are carried by all. Care is taken that the men are well supplied with tobacco. If wet weather is anticipated oil-skins are taken, and a change of clothing; plenty of tarpaulins are also supplied with which to cover the stores, ammunition, and clothing. Each boat carries a kettle to boil coffee, and each person a pot, pan, and spoon. The boat-boxes, with tools and materials for slight repairs, flint and steel, fish-hooks and lines, lead and line, lantern and candles, etc., are carried. Boat-compasses and glasses are distributed as far as they will go. The steam-launch is supplied with a set of signals, and the boats with answering pennants. The surgeon, with his instruments and medicine-chests, embarks in the hospital-boat.

The marines are distributed among the lighter boats, and a few of the best shots are detailed for the others. Every officer is provided with a full list of what he must take in his boat, and when the order is passed to fit out he collects all his material, and inspects it thoroughly. He then inspects his men fully armed and equipped. Having seen that his boat is completely provided, he has her stowed, and then manned, and when ready reports for service. When all the boats are ready, line is formed, and the senior officer inspects his flotilla. Column is then formed, and the steam-launch takes up the tow. A few oars in each boat are kept going, and, if the wind is favorable, sails are set.

In moving up the river care is taken not to be ambushed. Scouting-parties may be landed, if favorable eminences are near at hand, from which the banks may be viewed ahead. If attacked in force in a narrow river a fight should be made, and the advance continued after the enemy is repulsed; in a broad river it may be safe to run by the enemy if he is unprovided with boats. Care should be taken to destroy all boats which may be discovered on the way, as they might be used to cut off a retreat. If it is found necessary to land to cook the coffee, one boat only should be detailed for the work, the others lying off ready for a surprise. If the regulation boat-stoves have been provided for the larger boats, the cooking may be done without landing. Having arrived within shelling distance of the town, a well-directed slow fire should be opened on it. The howitzer-boats should take up commanding positions; the lighter boats, after the beach or landing has been cleared, should move in and land their men, with the exception of those detailed as boat-keepers, the steam-launch with the Gatling moving close in to cover the landing. If possible, the work of destruction should be carried out by this party. It may be found necessary to send in some of the heavier boats, but all should not be landed, except in a great emergency. The object of the expedition having been accomplished, the people should embark, and return to the ship as soon as possible, using the same precautions as in advancing.

For expeditions away from the ship, where the service has to be performed by land, the ship's battalion, or part of it, should be employed. As in the previous case, we will take the "Pensacola" as our example, and give her organization just as it stands.

The battalion is commanded by the executive-officer, and consists of four companies of blue-jacket riflemen, one company of marines, a platoon of howitzers, a Gatling section, an ammunition squad, a provision squad, a pioneer corps, a hospital detachment, and a band, whose members in the field act as aids to the wounded.

The rifle companies are the 1st, 2d, 3d, and 4th divisions of the ship's organization, the last being augmented by a detail from the powder division. The division officers command their own men. Each company numbers 36 men, including 2 guides and 2 file-closers. This leaves a number of men unassigned in each division.

The crew of No. 1 gun, 1st division, forms the crew of the Gatling. The first 12 men of No. 2 gun, 1st division, form the crew of No. 1 howitzer. The first 6 men of No. 5 gun, 2d division, and the second 6 men of No. 6 gun, form the crew of No. 2 howitzer.

The supply squads are taken from the different divisions. The pioneer corps from the engineer division. The medical detachment consists of the apothecary and several stretcher-men.

The men and officers, when fully equipped, carry blankets rolled, in which, if necessary, extra clothing and shoes are packed; a haversack, made of canvas aboard ship, in which are carried eating-utensils, rations, tobacco, and spare ammunition; a water-bottle, made by covering old bottles with flannel and securing a shoulder-sling to them; and canvas leggins, made by the men themselves. In cold weather pea-coats are added. For long expeditions the hammock, unslung and fitted with side eyelets, would be carried rolled over the blanket, for use as a shelter, several being laced together to form a tent, or to be placed under the men on the ground, or slung between poles as cots. They would also furnish cover to the men when throwing up rifle-pits, and could be used, in combination with poles, for hand-barrows or stretchers. Each man has a waist-belt, on which the riflemen carry a cartridge-box and bayonet. On actual service the cartridge-box would be replaced by an improvised prairie-belt. The cannoneers and supply-squad men wear cutlasses, to which the latter add a pistol. The officers wear their swords, and revolvers with cartridge-boxes. The officers are ordered besides to carry glasses, pocket-compasses, paper, pencil, etc., and, if possible, a sketched map of the ground to be operated over. The supply-squads are furnished with carrying-poles, on which are slung ammunition-boxes, or mess-kettles, and packages of supplies. The hospital detachment has two complete field-stretchers and a carrying-pole for the medicine-chest. These men carry no arms, and wear a "red cross" arm-badge. A small "red cross" hospital flag is carried by one of the detachment. The pioneer corps consists of 12 men, commanded by an engineer officer; they are armed with rifles without bayonets, and each man carries slung over his shoulders two tools. The tools include shovels, picks, crows, axes, hammers, cold-chisels, etc.

Only one howitzer is intended for landing for distant service; the second carriage is fitted as a limber, and used for carrying an extra supply of ammunition, a spare wheel, some tools, and a coil of rope. Both crews man this howitzer, and the infantry companies assist over heavy ground. The Gatling is taken, an extra tank of ammunition being slung to the carriage. The admiral's and captain's coxswains carry the national colors and a battalion flag (a jack, with the name of the ship in the centre). The markers, who also act as signal-men, carry hand-signal flags.

When the battalion, or any part of it, is landed, the boats are towed by the launch as much as possible. Regular boat-keepers under an officer are detailed for all the boats from men not belonging to the battalion.

There is another variety of landing-party, which, although not intended for war purposes, would seem to come appropriately within the limits of this article; it is the fire-brigade. All well-organized ships have such an organization, intended for landing to assist in extinguishing fires on shore, or to be sent to vessels on fire. The company organization, when the companies are taken from the same divisions, is the best, one company being equipped as wreckers, with axes, picks, shovels, crows, grapnels and chains, and Jacob's ladders, another as bucket-men. If there are efficient handy-billies, they may be fitted on the howitzer field-carriages, and taken in charge of the artillery-men. The fire-extinguishers should be carried by reliable men, and a supply of tarpaulins will be found useful.—*Theo. B. M. Mason*, *Lieutenant U.S.N.*

Lane. A passage through ice, or through a crowd.

Langrage, or Langrel. A projectile which was formerly used for the purpose of injuring the sails and rigging of an enemy's vessel during action. It consisted of various pieces of iron bound together, with sufficient size to fit the bore of the gun.

Languet (Fr. *languette*). That part of the hilt of a sword that overlaps the scabbard.

Laniard, or Lanyard. The rope which connects the upper and lower dead-eyes of standing rigging, and by which the rigging is *set up* or tightened. The laniard serves as the fall of a tackle, the dead-eyes being used in place of blocks. A *lock-laniard* is the long string attached to the lock of a gun, by which it is fired. A *port-laniard* is a line by which a port is closed, and by which it is held in position when *square* or extended parallel with the water. Each port is fitted with two laniards. A *knife-laniard* is the white cord or braided line worn about the neck, and to which the knife is attached, to secure it from falling from aloft, and the word is applied to any small line used for a similar purpose. A *bucket-laniard* is the rope handle of a bucket.

Lantcha. The name of a Malay vessel.

Lantern. A large light which vessels are required by law to exhibit from sunset to sunrise, when they are under way. A vessel under steam has a lantern at the foremast head, which shows a white light, and vessels whether under steam or sail carry *side-lanterns*, that on the starboard bow being green, and on the port bow red. The white light is required to show its rays over an arc of 20 points of the compass, or 225°; while the side lights each show their rays over an arc of 10 points, or 112° 30′. By means of this arrangement of lanterns the general direction in which a vessel is steering may be known to others, and by following the "Rule of the Road" the danger of collision is usually avoided. *Signal-lanterns* are used in communicating between ships of war, and are of the three colors, red, white, and green. *Battle-lanterns* are made of a frame-work of copper, in which glass slides are placed. They are hung in the rear of the guns on a covered deck during an action at night.

Lantern-brace. The iron fixture or rod by which a lantern is secured.

Lantern-fish (*Eng.*). The sole.

Lantione. The name of a Chinese row-boat.

Lap. The amount which a slide-valve extends over the ports when in mid-position, when working steam expansively. It acts by closing the port before the piston arrives at the end of the stroke; this is called steam-lap, and necessitates lap on the exhaust side, called exhaust lap, to prevent the steam being exhausted too soon.

Lapel, or Lapelle. Part of a coat. Previous to 1812 the white lapel denoted the rank of lieutenant in the English navy.

La Pérouse (Jean François de Galoup, Comte de), the celebrated and unfortunate French navigator, was born in 1741, and died in or near the island of Vanikoro at an uncertain date, supposed to be during the year 1788.

La Pérouse entered the French navy at 15, and was at once actively employed, being wounded and made prisoner at the action of Belle Isle, in 1759. Soon exchanged, he returned to duty. Was made ensign in 1764, and *lieutenant de vaisseau* in 1775, when he distinguished himself, in command of the "Amazon," by the capture of the English frigate "Ariel."

In 1782 he commanded at the destruction of the Hudson Bay establishments, previous to which he had made many captures of English vessels, and had been promoted to captain.

In 1785 the French government, stirred by the discoveries of Cook and other explorers, wished to take part in the survey of unknown seas thus happily commenced; and an expedition was resolved upon to search for the northwest passage, and to explore the Japan Sea, the Solomon Islands, and the southwest part of New Holland. Besides scientific purposes, the expedition was to have commercial aims, especially in the development of the fur-trade and the whale-fishery. The field thus blocked out proved too extensive, and the instructions for the voyage, drawn up under the directions of Louis XVI. himself, were entirely too minute and complicated.

The appropriately-named frigates "Boussole" and "Astrolabe," the latter under Capt. de Langle, were fitted out with every instrument and appliance known at that day, and had a full corps of scientific men and artists. The two vessels sailed from Brest on the 1st of August, 1785, and, after touching at various points in the Atlantic, doubled Cape Horn and put in at Concepcion, Chili. Proceeding thence to Easter Island and the Sandwich Islands, they sailed for the American coast, in the neighborhood of Mount St. Elias. Here bad weather and other causes prevented him from doing much work. Indeed, it took Vancouver three years to make an incomplete reconnoissance of these shores. Abandoning the northwest course, La Pérouse coasted down to Monterey, and then struck across for the Japan Sea, discovering islands and reefs on the way.

In January, 1787, he was at Macao. Sailing thence he touched at the Philippines, and reconnoitred Formosa, and in May reached the Corean Strait, of which country, as well as Japan, little or nothing was then known. Then followed a laborious exploration of the coast of Tartary, Japan, and the Kurile Islands, during which many bays, islands, and straits were plotted and named, he being the first to recognize the separation of Saghalien from Japan.

In September, 1787, the expedition was at St. Peter and St. Paul, in Kamschatka, where it was, by the order of the Empress Catherine, well entertained. Here they received dispatches, and sent home reports and charts. Soon at sea again, La Pérouse searched in vain for a large island laid down in the old Spanish charts to the eastward of Japan.

On December 9 he reached the Navigator group,—lovely islands, with ferocious inhabitants. Here Capt. de Langle and 11 men were killed by the natives, and 20 wounded. Without making reprisals, La Pérouse went on to the Friendly Islands, and thence to Botany Bay, where he arrived in January, 1788. The expedition sailed from Botany Bay in the latter part of February, and from that time forty years elapsed before any trace of them could be discovered.

The French Revolution, with its entire upheaval of social and official life, prevented any action in regard to them until 1791, when a decree of the National Assembly ordered a search. In the same year Admiral d'Entrecasteaux sailed upon the mission. He had no success in his search, passed within a short distance of Vanikoro without touching there, and died during the voyage. Nothing more of any moment was done until 1826–28, when the English Capt. Dillon and the French navigator Dumont d'Urville each went over the ground where information as to the fate of La Pérouse was supposed to be accessible.

On the island of Vanikoro, or Pitt's, in lat. 11° 36′ 30″ S., and lon. 166° 53′ 24″ E., some traces of the French discovery ships were found. According to the reports the two vessels must have been lost on the reefs surrounding the island. The crew of one of them were, after a fight, all massacred. Those of the other ship purchased peace with some goods saved, and then built a small vessel from the wreck of their own. In this they left the island, never to be heard of again. They left a few of their number behind in the service of the chiefs, but they were all dead when the searchers arrived. All the articles which Dillon recovered from the wrecks form a pyramid in the marine department of the museum of the Louvre.—*E. Shippen.*

Lap-joint. The method of joining the plates in iron ships and in boiler construction; there are two kinds, double and single riveted lap-joints; their relative strength as compared with the plate is as follows: entire plate 100, double-riveted joint 70, single-riveted 56.

Lapland Witch. A Laplander who professes to have the power to make the wind blow fair or foul.

Lapping. The name given to thin ice in the Arctic Seas where one piece overlaps another. The sound made by ripples breaking against the shore.

Lap's Course. See Lob-scouse.

Lap-sided. A term expressive of the condition of a vessel when it will not float or sit upright in the water. Lop-sided.

Lap-streak. A term used in boat-building to denote that the planks overlap.

Larboard. The left side of a vessel when facing towards the bow. On account of the re-

semblance of the word to *starboard*, and the consequent liability to mistake, *port* has been substituted, and is now in general use.

LARBOARD WATCH. The former name for *port* watch, one division of the crew of a vessel.

LARBOLINES. Formerly, a name given to the men of the larboard watch.

Lardner, James L., Rear-Admiral U.S.N. Born in Pennsylvania. Appointed midshipman from that State, May 10, 1820; served in the schooner "Dolphin" and ship "Franklin," 80 guns, flag-ship Commodore Stewart, Pacific Ocean, in 1821–24; August, 1825, joined frigate "Brandywine," and sailed to France, carrying to his home Gen. Lafayette, "the Nation's Guest." Sailed afterward to the Mediterranean, and returned to New York in 1826. October, 1826, sailed in frigate "Brandywine," flag-ship of Commodore Jacob Jones, to the Pacific Ocean, and served in that ship, schooner "Dolphin," and ship "Vincennes" until June, 1830, —nearly three years of which as navigating-officer of the latter ship, in which he circumnavigated the globe in 1829–30.

Commissioned as lieutenant, May 17, 1828. Summer of 1832, served as senior lieutenant in schooner "Experiment"; 1833–34, served in the "Delaware," 86 guns, flag-ship of Mediterranean Squadron, Commodore Patterson. April, 1837, ordered to "Independence," 60 guns, flag-ship of Brazil Squadron, Commodore Nicholson, and served in Russia, England, and in Brazil, 1837–38. In the years 1841–44 served as senior lieutenant in sloop "Cyane" and frigate "United States," flag-ship of the Pacific Squadron, nearly three years in the latter ship. Commanded receiving-ship, at Philadelphia, in the years 1845–48. May, 1850, sailed in command of brig "Porpoise" to the coast of Africa, and made a cruise of three years in command of that vessel and the sloop-of-war "Dale," returning to Boston in April, 1853.

Commissioned as commander, May 17, 1851. Served as fleet-captain of the West India Squadron, in the summer of 1855. 1860, ordered to the Philadelphia Navy-Yard.

Commission as captain dated May 19, 1861. September, 1861, ordered to command the steam-frigate "Susquehanna," North Atlantic Blockading Squadron; was with Dupont at the capture of Port Royal and blockading South Carolina and Georgia, for which service his name was sent to Congress by President Lincoln, for a vote of thanks, which passed the House, but was thrown out in the Senate. After the battle of Port Royal, Capt. Lardner received a complimentary letter from Flag-Officer Dupont, of which the following is a copy:

"WABASH, OFF HILTON HEAD,
PORT ROYAL, S. C., November 9, 1861.

* * * * * * * * *

"I inclose a general order, to be read to the officers and crew of the 'Susquehanna,' and I take the occasion to say that your noble ship, throughout the whole of the battle, was precisely where I wanted her to be, and doing precisely what I wanted her to do, and that your close support of this ship was a very gallant thing.

"Truly your friend,
(Signed) "S. F. DUPONT.

"Capt. J. L. LARDNER,
Commanding 'Susquehanna.'"

May, 1862, assumed command of the East Gulf Blockading Squadron, with the flag of rear-admiral. Returned home in December, invalided by a severe attack of yellow fever at Key West. Admiral Lardner lost, by yellow fever, 40 gallant officers and men, from his flag-ship, in the summer of 1862. In May, 1863, took command of the West India Squadron; squadron withdrawn, October, 1864. Retired November 20, 1864.

Commissioned as commodore, July 16, 1862.

Commissioned as rear-admiral, July 25, 1866. On special duty from 1864 to 1869. Governor of Naval Asylum, Philadelphia, 1869–71.

Large. Said of the wind when it is fair, so that the sails receive its full effect. A vessel is then said to *sail large*. *By and large*, "at all points." See BY.

Lark. A frolic.

Larrup. An old word meaning to flog.

Lascar. A native East Indian sailor employed on European vessels.

Lash. To secure with a rope or lashing.

LASH AND CARRY. The order given to the watch below when it is called at night, meaning that the hammocks are to be lashed and stowed in the nettings.

LASHING. A rope used to secure a movable object, or to fasten one object to another.

LASHING EYES. Eyes or eye-splices made in the ends of a rope by which they may be lashed together.

Lasher Bull-head (*Eng.*). The *Cottus scorpius*.

Lask. An obsolete term for sailing with the wind aft.

Laskets. Small loops made of cord for lacing one sail to another, as the bonnet to the jib.

Last (*Eng.*). A cargo. A weight which varied with different articles, but was generally estimated at 4000 pounds. A last of herrings or cod-fish was 12 barrels, of gunpowder 24 barrels, and of pitch or tar 14 barrels.

LASTAGE (*Eng.*). The duties paid upon such articles as were bought and sold by the last. Also a term which was used to denote the cargo of a vessel.

Laster (*Eng.*). The flow of the tide

Latching Key. The centre loop or lasket which serves as a key to the rest, and prevents them from unreeving. See LASKETS.

Lateen-sail. A triangular sail used on native vessels from the northern coast of Africa and Turkey, and seldom seen but in the Mediterranean. It is bent to a long tapering yard which hoists to a comparatively short mast, the halliards being secured to the yard at one-quarter of the distance from the forward or lower end.

Lateen-yard. The yard to which a lateen-sail is bent.

Lateral Resistance. The resistance of the water against the side of a vessel in a direction perpendicular to her length.

Lates (*Lates Niloticus*). A fish of the perch family, one of the most delicate and best-flavored fishes of the Nile. It grows to a large size, sometimes 3 feet long. It is mentioned by several ancient authors. In form it resembles a perch. Another species of this genus is the *Vacti*, called *Cock-up* by the English in Calcutta, one of the most esteemed fishes of the Ganges, which it ascends as far as the tide does.

Lathe. The name of a cross-bow used in the early days of the English navy.

Lather. To beat soundly.

Latitude. The latitude of a point on the earth's surface may be defined as its angular distance from the equator measured on a meridian. This is the geographical latitude as found by astronomical observations, and if the earth were a sphere would coincide with the geocentric or true latitude, which is an angle formed between a line drawn from the place in question to the centre of the earth and the plane of the equator.

The difference between the two latitudes is not great, but enters into the rigid determination of longitude by the method of lunar distances, as well as into other astronomical problems. This correction has, therefore, been tabulated for use in such cases. It is called the *angle of the vertical*, and attains a maximum of 11′ 30″ at the latitude of 45°.

The direction of the centre of the earth can only be determined by the plumb-line, or by the perpendicular to a fluid surface.

Astronomical or geographical latitude is determined in many ways. At sea, the methods most in use are the measurement of the altitude while on the meridian of a celestial body, the declination of which is known, and by the determination of two lines of equal altitude by what is called Sumner's method. (See NAVIGATION.) On shore, latitudes can be determined with great exactness by numerous methods. Besides the methods in use in fixed observatories, there are three of great precision in use by surveyors, viz., by circum-meridian altitudes of stars, by either the common or the prismatic sextant and the artificial horizon, by measurement of the difference of zenith distance of pairs of stars with the zenith telescope, and by observations of the transit of stars over the prime vertical. (See Chauvenet's "Spherical and Practical Astronomy.") —*F. M. Green, Lieutenant-Commander U.S.N.*

LATITUDE BY ACCOUNT. The latitude deduced from the course and distance sailed since the last observation.

LATITUDE BY OBSERVATION. The latitude deduced from an observation of a heavenly body.

LATITUDE (TERRESTRIAL), PARALLELS OF. Lesser circles of the sphere parallel to the equator.

LATITUDE, DIFFERENCE OF. The difference of latitude of two places is the arc of a meridian included between their parallels of latitude.

LATITUDE OF A HEAVENLY BODY. The angular distance of the body from the ecliptic.

LATITUDE (CELESTIAL), CIRCLES OF. Great circles of the celestial sphere passing through the poles of the ecliptic; so called because latitude is measured upon them.

LATITUDE (CELESTIAL), PARALLELS OF. Lesser circles of the celestial sphere parallel to the ecliptic.

LATITUDE, HELIOCENTRIC AND GEOCENTRIC (Gr. *helios*, the sun; *gē*, the earth; and *kentron*, the centre). Terms applied especially to the planets. The distance of the planets from the earth is small compared with that of the fixed stars, and hence the place of any one of them on the celestial sphere varies with the position of the spectator in different parts of the earth's orbit. Thus, viewed from the earth as centre we have the geocentric place of a planet and the corresponding geocentric latitude and longitude. On the contrary, if viewed from the sun as centre we have the heliocentric place of the planet, and the corresponding heliocentric latitude and longitude. The geocentric differs from the heliocentric place of a planet by reason of that parallactic change of apparent situation which arises from the earth's motion in her orbit.

Launce (*Eng.*). From the Danish word *loens*, exhausted. A term used when the pump sucks.

Launch. The heaviest boat in a ship of war. Each ship usually carries two launches,—one a steam-launch and the other a sailing-launch. The former is fitted for the use of torpedoes, and is of great utility in towing the remaining boats of a vessel, or in making trips of considerable extent from the vessel. The sailing-launch is sloop-rigged, and is also fitted with 16 oars. A howitzer is carried in the bow, and by means of a field-carriage it can be landed and used as light artillery. Boats of this class are used for heavy work, such as carrying stores or laying out and weighing an anchor in shoal water, and also in expeditions against an enemy's coast or small vessels.

To launch *a vessel* is to cause it to slide from the ways upon which it has been built into the water. To *launch a spar* or any heavy object is to push or slide it. To *launch a topgallant-mast* is to slack the mast-rope and allow the weight of the mast to be supported by the fid, after the mast has been swayed aloft.

LAUNCH-ENGINE. A small engine for propelling a steam-launch, usually similar in construction to the ordinary marine-engine, though sometimes the boiler and engine are attached for compactness.

LAUNCHING-RIBBAND. An oak plank bolted to the outside of the launching-ways to guide the cradle in its descent in launching.

LAUNCHING-WAYS. A platform built upon each side of the ship, whereon the bilge-ways slide in the process of launching.

La Vallette, Jean Parisot de. Forty-eighth grand master of the Knights of Malta. Born 1494, died 1568.

Always prominent in the order, La Vallette was especially distinguished for great courage and ability in constant war with the Turks. He became governor of Tripoli, grand prior of St. Gilles, and of the "Langue de Provence," and lieutenant-general under the grand master, Claude de La Sangle, at whose death, in 1557, La Vallette was thought most worthy to succeed to the grand mastership. He at once instituted needed reforms, exercising his power freely in the interests of the order; making the priors and commanders of the German and Venetian branches pay their arrears of tax, restoring military discipline, which had become very lax, and increasing very considerably the fleet of the order.

Desiring to recapture Tripoli, which had been abandoned to the Turks, he allied himself with the viceroy of Sicily, but owing to the misconduct of the latter the expedition became a failure.

La Vallette had, however, better success in his contests with the Turkish fleet, of which he captured a very large number in various engagements. This so enraged Solyman II. that he resolved to attempt the capture of Malta, and, to this

end, made extensive preparations. In 1565 Malta was besieged by 40,000 Turks in 200 vessels. La Vallette, in his arid and unproductive island, resisted this formidable attack in the most heroic manner for more than four months, when reinforcements arrived and the Turks were forced to raise the siege.

Having saved Malta, he proceeded to make it impregnable, and, in addition to the well-known defensive works, built the new city, which still bears his name, and which is not very much altered in appearance at the present day.—*E. Shippen.*

Laver. The leaves of an edible seaweed.

Lavy. The name of a sea-bird which frequents the Hebrides, and whose movements are believed by the inhabitants to indicate changes of weather.

Law, Richard L., Captain U.S.N. Born in Indiana; appointed midshipman, 1841; "Delaware," Brazil Station, 1841–43; "Lawrence," Home Station, 1843–45.

Promoted to passed midshipman, 1847; "Perry" and "Brandywine," Brazil Station, 1847–50; coast survey, 1851–53.

Commissioned as lieutenant, 1855; "Constellation," Mediterranean Station, 1856–57; Naval Academy, 1858–59; "Hartford," Asiatic Station, 1859–61.

Commissioned as lieutenant-commander, 1862; commanding "Clifton," West Gulf Blockading Squadron, 1862–63; three engagements at Galveston, and one at Lavacca; store-ship "New Hampshire," South Atlantic Blockading Squadron, 1865–66.

Commissioned as commander, 1866; receiving-ship "New Hampshire," 1866–67; "Tacony," North Atlantic Station, 1867; "Suwanee," North Pacific Station, 1868; "Ashuelot" and "Iroquois," Asiatic Station, 1868–70; navy-yard, Philadelphia, 1871–72; Naval Asylum, 1873–74; "Dictator," North Atlantic Station, 1874–75; Bureau of Yards and Docks, 1877–78; chief of Bureau of Yards and Docks, 1878–81.

Commissioned as captain, 1879.

Law of Nations. The code of laws by which the intercourse between different sovereign states is regulated. "It consists of those rules of conduct which reason deduces as consonant to justice, from the nature of the society existing among independent nations, with such modifications and deviations as may be established by general consent." See INTERNATIONAL LAW.

Lawrence, James, Captain U.S.N., was born October 1, 1787, at Burlington, N. J. Appointed midshipman September 4, 1798, he served in the "Ganges," Capt. Tinghey, and in the "Adams," Capt. Robinson. When the navy was reorganized he was still named as midshipman (1801). He was soon after promoted to lieutenant, and went to the Mediterranean in the "Enterprise." He distinguished himself in an attack on boats in Tripoli harbor, led by Porter, and was engaged in the destruction of the "Philadelphia," in the ketch "Intrepid," February 15, 1804. He was first lieutenant of the "Constitution" in 1808, commanded the "Vixen," 14, in 1809, the "Wasp," 18, in 1810, and the "Argus" the same year. He was promoted to master commandant in 1811, and commanded the "Hornet," 18. He went twice to Europe with dispatches, and sailed for the West Indies in Commodore Rogers's squadron in June, 1812; captured a letter of marque and the brig "Resolution," and on the 24th of February, 1813, the British sloop "Peacock," 18, after a sharp engagement of thirty minutes. For this he was promoted to captain, given a medal, and the command of the frigate "Chesapeake." On the 1st of June, 1813, he engaged the British frigate "Shannon" off Boston harbor. Capt. Lawrence was soon wounded, exclaiming, as he was carried below, "Don't give up the ship!" Weakened by losses and by disaffection among the crew, his ship was captured by a boarding-party and carried to Halifax, where Capt. Lawrence was buried, having died on the way, on the 6th of June, at the age of 32. He was a fine seaman, brave, chivalrous, and just.—*F. S. Bassett, Lieutenant U.S.N.*

Lay. A share in the proceeds of a whaling voyage paid to each of the crew instead of monthly wages. The direction given to the strands of a rope in laying it up. *To lay* is used in the sense of to *go* or *come*; as, *lay forward*, *lay down from aloft*, etc. *To lay a gun* is to point it at an object. *To lay up a rope* is to twist the strands together. *To lay on oars* is to cease rowing, and keep the oars parallel with the water. *To lay in stores* is to take provisions on board. A ship *lays her course* when being close-hauled, the wind permits the desired course to be steered. *Lay to.* (See LIE TO.) *To lay up a vessel* is to dismantle her.

LAY-DAYS. The number of days specified in a charter-party which are allowed for the loading and unloading of a vessel, and beyond which a certain sum per diem, called demurrage, must be paid for the detention.

LAYING DOWN. The delineation of the different parts of a ship to their full size upon the mold-loft floor.

Lay-lords (*Eng.*). The civil members of the board of admiralty.

Lazaretto. A hospital for the treatment of infectious diseases. A place near the stern in some merchant vessels where provisions are stowed.

Lazy-bars. Bars of iron temporarily placed across the mouth of a furnace to support the fire-irons in working at the back end of a furnace.

Lazy-guy. A light rope or tackle used for steadying the spanker-boom.

Lazy-painter. A small rope used for securing a boat in smooth water.

Lead. An apparatus used on board vessels to determine the depth of water. It is generally made of lead, of prismatic shape, tapering to the upper end, through which a hole is made for a strap, to which is attached a marked line. The lead is thrown overboard from the vessel, and when it reaches the bottom, and the line is vertical, the depths are shown by the marks on the line.

There are three classes of leads in use,—the hand-lead, weighing from 7 to 14 pounds, and from 6 to 10 inches in length; the coasting-lead, weighing from 25 to 50 pounds, and about 18 inches long; and the deep-sea-lead (pronounced *dipsey-lead*), weighing from 75 to 120 pounds, and about 2 feet long. The line used with the hand-lead is about 30 fathoms long, and is used in depths of 25 fathoms and under, that of the coasting-lead 120 fathoms long, and used in water from 25 to 100 fathoms in depth, and of the deep-sea-lead 300 fathoms, and used in depths over 100 fathoms.

These lines are marked,—hand-lead, at 1 fathom from the lead, generally, a toggle is placed for the leadsman to handle it by, at 2 fathoms 2 strips of leather, at 3 fathoms 3 strips, at 5 fathoms a white rag, at 7 fathoms a red rag, at 10 fathoms a piece of leather with a hole in it, at 13 fathoms the same as at 3, at 15 fathoms the same as at 5, at 17 fathoms the same as at 7, at 20 fathoms a piece of leather with two holes in it, or a piece of line with 2 knots, at 25 fathoms one knot, at 30 fathoms 3 knots.

The coasting- and deep-sea-lead-lines are both usually marked in the same manner, viz.: at 10 fathoms one knot, at 20 fathoms 2 knots, at 30 fathoms 3 knots, etc., and each 5 fathoms is marked by a piece of line with no knot, at 100 fathoms a piece of red bunting, at 200 fathoms a piece of white, and at 300 fathoms a piece of blue.

Heaving or casting the lead. To ascertain the depth of water by the use of the leads and their lines.

By the hand-lead.—The leadsman takes his place generally in the main chains of the vessel, or any place outside where he can have a good foothold and a clear swing, with a broad belt passing around his waist fastened at both ends, to prevent him from falling overboard. From his waist down he is protected from the drippings of the line by a tarpaulin. The end of the lead-line is fastened near by. He takes a coil of line in his hand sufficient, as he estimates, to reach the bottom, holding it clear for running out, and in the other hand the line at the toggle, swings the lead to and fro until it has sufficient velocity to carry the line out, when he lets it go in the direction in which the vessel is moving, letting the lead take the line from the hand having the coil, as the ship advances, so that when the ship arrives at where the lead reached the water the line is up and down, when he can feel if the lead has touched bottom. If the lead reaches bottom, he notes the mark at the water's surface, or estimates the depth from the nearest mark.

There are several nautical terms used by leadsmen in reporting soundings. They are reported in fathoms and quarters. All the depths marked on the line are called *marks*, and the fathoms not marked, "*deeps.*" For example, if the depth were 3 fathoms, it would be reported as "*by the mark 3*"; if 4 fathoms, as "*by the deep 4*"; if 3¼ fathoms, as "*and a quarter 3*"; if 3½ fathoms, as "*and a half 3*"; if 3¾ fathoms, as "*and a quarter less 4.*" If no bottom is reached, it is reported as "*no bottom*" at so many fathoms, the length of line thrown out.

When a vessel is going at a greater rate of speed than 8 knots, it is very difficult to get soundings in this manner in depths greater than 10 fathoms, and then the lead must be whirled around the head to make it carry out enough line.

A hand-lead as small as from 3 to 5 pounds weight, with a very light line marked to feet, is used from boats for running lines of soundings in shoal water.

By the coasting- and deep-sea-leads.—As it is important to know the character of the bottom, these leads have the lower end cup-shaped, and the hollow filled with soft clean tallow before being cast (called arming the lead). If the lead reach bottom, it is known by a sample sticking to the tallow; usually there is enough to indicate roughly the nature of the ground.

To get a sounding or *cast* with these leads, it is necessary to reduce the speed of the vessel, and if the water is deep, to stop her way altogether, and keep her in as near the same position as possible, which is done by "*luffing up,*" or "*heaving to,*" in a sailing-vessel, or by stopping and backing the engines in a steamer.

The lead is *armed* and taken to the bows of the vessel, a sufficient number of the crew stationed outside along the weather side of the ship. The line, either wound up on a reel or coiled down in a tub, is placed at the stern, the end rove through a snatch-block made fast outside the vessel at the stern in a convenient place, carried forward outside of everything and made fast to the lead. Each man stationed on the outside takes a coil of the line in his hand and keeps it clear for running until sufficient is judged to be out to reach bottom. When the vessel's way has been sufficiently checked, or she has been brought to a stationary position, the order is given, "*Stand by!*" "*Heave!*" When the lead is thrown overboard, the person doing it cries out, "Watch-oh-watch!" As the lead sinks each man lets it take the line from his hand, so that he can feel if it has reached bottom; if so, he cries out, "Bottom!" when the mark is noted and the line hauled in through the block aft. If no bottom is felt as the last part of the line leaves the man's hand, he calls out to his next aft, "Watch-oh-watch!" and so on to the stern, where the rest of the line may be left to run off the reel or out of the tub, watching to see if the lead touch bottom, which will be known by the line slacking. If the *cast* is satisfactory, the line is hauled in, the depth and character of the bottom noted, and the vessel resumes her way.

If the ship is in heavy weather, or drifting to leeward, it is best to take the line outside around the stern from to "windward," so that by the time it has run out it will be nearly up and down, the ship having drifted to that place while the line was running out. Sometimes a buoy and nipper is used to insure an up-and-down cast (called Burt's buoy and nipper). The line is run through a spring catch on the buoy, and the buoy thrown overboard with the lead and line; the line will run through the nipper as long as the weight of the lead is felt, but when it reaches the bottom the spring of the nipper will catch the line and hold fast, so that the depth may be measured on the line from the buoy.

The above methods are used to obtain soundings by vessels approaching an unknown coast, and so as to enable the navigator to tell from the depth and character of the soundings his approximate position in foggy weather on a coast of which there are good charts.

For soundings to be plotted on surveys and for scientific purposes finer work is needed, especially in deep-sea soundings.

Moderate soundings may be accurately determined by the hand-lead, as before described, moderating the speed of the vessel for the purpose.

A lead coming very much into use of late years is Thompson's pressure-lead, which consists of a glass tube fitted into the lead, so as to give free access to the water at its lower end.

This tube has a chemical preparation on the inside, which the water discolors as it forces its way up in the interior, which it will do in proportion to the depth the lead descends, and from the known laws of hydrostatics we can determine from the length of the discolored part of the tube the depth the lead has reached.—*J. E. Noël, Lieutenant-Commander U.S.N.*

LEAD-LINE. The line to which the lead is attached, and by which the depth of water is measured.

LEADSMAN. A man stationed to heave the lead.

Lead. The distance the main steam-valve has opened the port, when the piston is at the end of the stroke, or the crank is on the centre; if referred to the steam-port it is called *steam-lead*, if to the exhaust-port, *exhaust-lead.* When two engines are connected to one shaft, as in marine engines, the cranks are usually placed at right angles to each other, but sometimes this angle exceeds 90°, and one crank placed as much as 115° ahead of the other; this angular advance above 90° is termed the *lead of the crank.* A navigable channel through field-ice. The course of a rope from end to end; a rope *leads clear* when it passes directly from one block to another, or to the deck, without obstruction.

LEADER, or FAIR-LEADER. A piece of wood (usually lignum-vitæ) through which holes are bored, used for the purpose of leading ropes in their proper places.

LEADING-BLOCK. A block, secured to the deck, through which a rope is led for the purpose of convenience in pulling.

LEADING-MARKS. Elevated objects on shore, which, when in range, serve as a guide in entering port.

LEADING-PART. That part of the fall of a tackle which is led out and hauled upon.

LEADING-STRINGS (*Eng.*). Yoke-ropes, used in steering a boat in place of a tiller.

LEADING WIND. A wind abeam or quartering.

League. A measure of distance, more commonly used at sea, but in use by some European nations as a measure of distance on land. Among different nations the length of a sea league varies, as follows: United States, Great Britain, France, and Italy, 6075 yards; Holland and Germany, 8100 yards; Spain, 7416 yards; Russia, 8468 yards, etc. The *marine league* is the distance from the coast over which a government has jurisdiction, and this distance has been chosen as being the limit of effective range of artillery.

Leaguer (*Eng.*). A long water-cask used before the introduction of water-tanks. Its capacity was 159 imperial gallons.

Leak. A hole through which the water finds entrance into a vessel. *To spring a leak* is to strain the seams sufficiently to cause leakage.

LEAKAGE. The loss from a cask by leaking. The allowance which is made for the waste and leaking from casks of wines, liquors, etc., when duties are imposed.

LEAKIES (*Scotch*). Irregularities in the changes of the tide in the Frith of Forth.

LEAKY. The condition of a vessel which admits water through the seams, or that of a cask which will not retain liquid.

Lean. Thin or sharp, like the bow of a clipper.

Leaper (*Eng.*). A sea that breaks on board. Also, the spray from the waves under the bow.

Leap-year. See BISSEXTILE.

Leather. See LATHER.

LEATHER-JACKET. A fish found in the tropics, and so called from the thickness of its skin.

Leave, or Leave of Absence. Permission to be absent from a ship or station. A person takes *French leave* when he absents himself without permission, and breaks his leave or liberty when he does not return at the time specified.

Le Clanché Battery. See GALVANIC BATTERY.

Ledge. A line of rocks below the surface of the water. A short piece of timber in the deck-frame of a vessel, which is placed between the beams and let into the carline and knee.

Ledo. An old Latin law-term for the flow of the tide.

Lee, Samuel Phillips, Rear-Admiral U.S.N. Born in Virginia, February 13, 1812. Appointed midshipman from his native State, November 22, 1825; attached to frigate "Java," Mediterranean Squadron, 1828–32.

Promoted to passed midshipman, June 10, 1833; frigate "Brandywine," Pacific Squadron, 1834–35, and to sloop "Vincennes," same squadron, 1836–37.

Commissioned as lieutenant, February 9, 1837; attached to West India Squadron, 1839–42; coast survey, 1841–44; Pensacola Navy-Yard, 1845–46; coast survey, 1847–51; commanding brig "Dolphin," special service, 1852; hydrographical duty, 1852–54; Naval Observatory, Washington, 1855.

Commissioned as commander, September 14, 1855; special service, 1856–60. In 1861, Commander Lee was ordered to command the sloop-of-war "Oneida," and in that vessel took part in the attack and passage of Forts Jackson and St. Philip, and the various battles on the Mississippi from New Orleans to Vicksburg, winning a high reputation for gallantry and devotion to duty.

Commissioned as captain, July 16, 1862, and ordered to the command of the North Atlantic Blockading Squadron, with the rank of acting rear-admiral. While in command of the North Atlantic Blockading Squadron, he greatly harassed the enemy by numerous expeditions up the navigable streams within the limits of his squadron. He was at all times ready to co-operate with the army, and on more than one occasion the presence of his vessels saved the military forces from serious disaster. Wilmington, N. C., was the most difficult port on the coast to blockade, but Acting Rear-Admiral Lee, by a wise distribution of the vessels of his squadron, made the blockade as effective as it was possible to make it. In the summer of 1864, he was transferred to the command of the Mississippi Squadron. In December of the same year he rendered good service to the country, by keeping open the Cumberland River at the time Hood's army was advancing on Nashville, and when the safety of the army under Gen. Thomas depended in a great measure upon reinforcements and supplies reaching them promptly; the railroad communication between Louisville and Nashville having been interrupted, the Cumberland River was the only channel of communication. During this campaign he was several times under fire, and for his services received a vote of thanks from Congress. In 1865 the

Mississippi Squadron was disbanded and most of the vessels were sold, Captain Lee being ordered East.

Commissioned as commodore, July 25, 1866; in 1866–67, he was president of the board to examine volunteer officers for admission into the regular navy; on special duty at Washington, D. C., 1868–70.

Commissioned as rear-admiral, June, 1870, and to the command of the North Atlantic Fleet. Retired, 1873.

Lee. The direction towards which the wind blows, used in contradistinction to *weather*, or the direction from whence it comes. Hence the lee side of a vessel is the side opposite to that against which the wind blows. The word is also used in the sense of shelter; as, "The ship is under the lee of the land," or protected by the land. A ship is *brought by the lee* when her course is changed so as to cause the wind to blow against what was before the lee side, thus laying the sails aback.

LEE-ANCHOR. The anchor on the lee-bow when the vessel is under way. When moored, the lee-anchor is the one to which the vessel is not riding.

LEE-BEAM. The position of an object on the lee side of a vessel when a line drawn from the object to the vessel would be at right angles to the keel.

LEE-BOARD. A board or frame fastened to the side of a small vessel, to serve as a keel and lessen the amount of leeway when close-hauled.

LEE-FANG (*Eng.*). A rope passed through the sheet-cringle of a jib, for hauling it amidships while the bonnet is being laced.

LEE-FANGE (*Eng.*). The iron bar or traveler secured to the deck in small fore-and-aft vessels upon which the sheets slide.

LEE-GAUGE. The position of a vessel when to leeward of another. See WEATHER-GAUGE.

LEE-GUNWALE UNDER. Said of a boat when carrying such a press of sail that the lee-gunwale is at the water's edge.

LEE-HATCH. A former order to the helmsman not to steer to leeward of the course was, "Take care of the *lee-hatch.*"

LEE-LURCH. A heavy, sudden roll to leeward.

LEE-SHORE. A coast against which the wind is blowing.

LEE-SIDE. The side of a ship which is farthest from the wind. Junior officers of the watch, and officers not on duty, are allowed to promenade on the lee side of the quarter-deck.

LEE-TIDE. A tide which runs in the direction of the wind.

LEEWARD. Towards the lee,—used in a general sense.

LEEWARDLY. Said of a vessel which sags to leeward when close-hauled, showing a lack of weatherly qualities.

LEEWAY. The drift which a vessel makes when close-hauled. The amount is greater or less according to the weatherly qualities of the vessel, the force of the wind and sea, and the amount of sail which the vessel can carry.

LEE-WHEEL. The lee side of the wheel, where the assistant to the helmsman is stationed.

Leech. The side of a square-sail, and the after edge of a fore-and-aft sail.

LEECH-LINE. A rope with which the leech of a course is pulled up to the yard.

LEECH-LINE BLOCK. A block fastened to the fore- or main-yard, through which the leech-line is rove.

LEECH-ROPE. The rope which is sewed to the leeches. See SAILS.

Left-handed Rope. Rope laid up against the sun.

Leg. The course and distance made upon one tack. A *good leg* is made when the course on a tack is near the desired course. *Long* and *short* legs refer to the comparative distances sailed upon different tacks. The spars of which a pair of sheers are formed are called *sheer-legs*. The ends of two ropes spliced together, as bunt-lines are sometimes made, are also called *legs*. A ship is said to have *legs* when she is a fast sailer.

LEG-ALONG (*Eng.*). To lead out a rope ready to be manned.

LEG-BAIL. To give *leg-bail* is to escape from custody.

LEGS OF THE MARTINETS. Two ropes, fastened to the leech-rope of a course and spliced together, to which the martinet was secured.

LEGS AND WINGS. Said of a vessel with masts of great height, and which consequently has too great spread of sail.

Legger. A mis-pronunciation of *leaguer* (which see).

Leghorn, Italy, one of the best known of the Mediterranean ports, is situated on a tongue of land extending into the Mediterranean, in lat. 43° 32′ 42″ N., lon. 10° 27′ 45″ E. The exports consist chiefly of manufactured articles of coral, woolen, and silk goods, straw bonnets, cordage, leather, etc. The harbor is of large extent, but is somewhat difficult of entrance. The roadstead W.N.W. of the harbor is protected by a long sand-bank, and has good anchorage. Originally a Roman port, it had dwindled to a fishing-village, when its fine capabilities for commerce were discerned by the celebrated Medici family, who constructed its harbor and surrounded it with fortifications, and bestowed upon it the privilege of full toleration for all nations and creeds. Pop. 98,000.

Leister (*Eng.*). A spear with three prongs used for taking fish.

Leit (*Eng.*). A fishing-line made of horsehair.

Leith, Scotland, is the seaport of Edinburgh, from which it is distant 2 miles, on the south shore of the Frith of Forth. Lat. 55° 58′ 54″ N.; lon. 3° 10′ 30″ W. The chief manufactures consist of ropes, cordage, sails, chemicals, glassware, etc. It has extensive ship-building yards, sugar-refineries, and breweries. The harbor is an excellent one, and is protected by two piers or breakwaters, which advance from opposite shores toward each other, making the entrance but 250 feet in width. There are extensive wet-docks, graving-docks, dry-docks, and the harbor is also protected by a battery. Pop. 45,000.

Leith (*Swe.*). A channel.

Lembus. An ancient name for a small piratical craft having no deck.

Leming-star. The name formerly given to a comet.

Lemon Rob (*Eng.*). Lemon-juice thickened by evaporation.

Lend a Hand. To give assistance.

Lend Your Pound. To assist by one's weight,

as in hauling upon a rope. It refers to the allowance of meat in the navy ration.

Lengthening. In a ship, is adding to the length. It is sometimes performed on the ends of a ship, and nowadays 100 feet is often put into the middle of the long steamships. It is done by driving out all of the fastenings in the wake of the butts which secure the ship amidships; the ends are then drawn apart to the distance required, the keel is then made good, and new floors, frames, and keelsons put in, as was practiced when commencing the ship, and a new ship practically built in the space which has been made by the separation of the two ends. Great care and good judgment are required in connecting the work again, and proper arrangements made to retain the strength which is lost to the structure by the addition of this central piece.

Length of a Wave. The horizontal distance between two adjacent crests, or two adjacent hollows.

Lens. A glass used in magnifying instruments.

Lentria. An ancient name of a small vessel used in river navigation.

Lenunculus. An ancient fishing-boat.

Leo, Constellation of (*Lat.* "The Lion"). The fifth constellation of the zodiac, coming between Cancer and Virgo, and situated near the Great Bear on the opposite side of it to the pole star. Its four principal stars form a trapezium. α *Leonis*, called also *Cor Leonis* ("The Lion's Heart") and *Regulus*, may be found by joining α and β Ursæ Majoris ("The Pointers") and continuing the line about twice the length of that constellation; this line also passes γ *Leonis*. β *Leonis*, called also *Denebola* ("The Lion's Tail"), is found by joining η Ursæ Majoris (the last star in the tail of the Great Bear) with Cor Caroli, and continuing it to about twice its length.

Leo, Sign of. The fifth sign of the ecliptic, including from 120° to 150° of longitude. Owing to the precession of the equinoxes, the constellation Cancer, and not Leo, is at present in this sign. The sun is in Leo from 22d July to 23d August. Symbol ♌.

Leo Minor. See CONSTELLATION.

Lepadogaster. A genus of fishes having the ventral fins expanded and curved forward, so as to form the boundary of an adhesive disk beneath the throat, and the body smooth and without scales.

Lepidosiren. A very remarkable genus of animals, by some regarded as a fish, and by others as a batrachian. The bones are very soft and cartilaginous, or even gelatinous, except those of the head, which resemble those of no other known vertebrate, though most like fishes. The scales are cycloid. The dentition is very remarkable. The jaws are covered with an undulating ribbon of bone, covered with enamel, the undulations of the upper and lower jaw adapted to each other, and along the edges are small, sharp teeth. There are free filamentary gills situated under gill-covers, as in osseous fishes, but two of the arterial arches, which ordinarily supply the gills of fishes with blood, are represented by trunks, which proceed to the double air-bladder, and ramify over its cellular surface, so that the air-bladder, having a communication with the mouth, is capable of serving to a certain extent the purpose of lungs, and the animal is enabled to sustain a torpid existence during the dry season in mud, in which it forms for itself a kind of nest, which has been likened to the cocoon of an insect, by means of a mucous secretion from its body. It is found in ponds and rivers of intertropical Africa and South America.

Leppo. A composition used by the Chinese for paying the seams of a vessel.

Lepus. α *Leporis*, Arneb. See CONSTELLATION.

Le Roy, William E., Rear-Admiral U.S.N. Born in New York, March 24, 1818. Appointed from New York, January 11, 1832; attached to frigate "Delaware," Mediterranean Squadron, 1833–36; brig "Dolphin," Brazil Squadron, 1837–38.

Promoted to passed midshipman, June 23, 1838; frigate "Constitution," Pacific Squadron, 1839–40; store-ship "Erie," 1842–43.

Commissioned as lieutenant, July 13, 1843; steamer "Mississippi," Home Squadron, 1846; steamer "Princeton," Home Squadron, 1847; engagement with Mexican soldiers at Rio Aribiqua, while assisting to water the "Princeton"; sloop "Savannah," Pacific Squadron, 1849–51; waiting orders, 1852; frigate "Savannah," Brazil Squadron, 1853–55; Naval Station, Sackett's Harbor, New York, 1857–58; frigate "Sabine," Brazil Squadron, 1859; commanding steamer "Mystic," coast of Africa, 1861.

Commissioned as commander, July 1, 1861; commanding steamer "Keystone State," South Atlantic Blockading Squadron, 1862–63; capture of Fernandina, 1862; engagement with ironclads, off Charleston, S. C., January, 1863; commanding steam-sloop "Oneida," Western Gulf Squadron, 1864; commanding steam-sloop "Ossipee," Western Gulf Squadron, 1864–65. Commanded the "Ossipee" at the battle of Mobile Bay, August 5, 1864; his vessel was struck many times, but, fortunately, not disabled. When about running down the "Tennessee," that vessel displayed a white flag, and Capt. Le Roy received her surrender from Capt. Johnson, her commander, the rebel admiral, Buchanan, being wounded; naval rendezvous, New York, 1866–67.

Commissioned as captain, July 25, 1866; fleet-captain, European Squadron, under Admiral Farragut, 1867–68.

Commissioned as commodore, July, 1870; special duty, New London, 1871; senior officer Board of Examiners, 1872–73.

Commissioned as rear-admiral, April 5, 1874; commanding South Atlantic Station, 1874–76; North Atlantic Station, 1876; European Station, 1878–80. Retired March 24, 1880.

Lerrick (*Eng.*). The sand-piper.

Lesseps, Ferdinand de. A French engineer, rich in original conception and skillful in execution. Through his untiring efforts the channel connecting the Mediterranean with the Red Sea, and now known as the Suez Canal, was opened, to the infinite advantage of the trade between Europe and India. He has recently conceived a plan for establishing a communication between the Atlantic and Pacific, across the Isthmus of Panama.

Lesser Circle. A circle whose plane does not pass through the centre of the sphere.

Let Draw. The order given in tacking a fore-and-aft vessel, at which the sheets of the jibs are allowed to slip to the lee side, after the vessel's head has fallen off sufficiently from the wind.

Let Drive. To throw.

Let Fall. The order to let a sail drop from the yard after loosing.

Let Fly. To let a rope go quickly without first slacking away.

Let Go and Haul. An order in tacking, when the fore-bowline and lee head-braces are let go and the head-yards are hauled around.

Let Go Under Foot. Said of an anchor when it is let go, but, the vessel being stationary, without veering cable.

Let In. To secure one timber to another, as a carline to a beam, by a mortise and tenon.

Let Out a Reef. To increase the size of a sail by untying one line of reef-points.

Let-pass (*Eng.*). A pass or paper furnished to a vessel to prevent detention by a ship of war.

Let Run, or Let Go by the Run. To let go quickly.

Letter-board. See NAME-BOARD.

Letter-book. A book for the preservation of copies of letters.

Letter-man (*Eng.*). See KING'S LETTER-MAN.

Letter of Marque. A commission or license issued by a government to a private armed vessel authorizing reprisals on an enemy. The first commissions of this kind were issued about the middle of the 13th century, during the reign of Edward I. of England, and vessels carrying such commissions, called also "letters of marque," have taken a prominent part in succeeding wars between maritime nations as late as the early part of the present century.

Letter of Reprisal. See LETTER OF MARQUE.

Lettuce-laver (*Eng.*). The *Ulva lactuca*, an edible kind of sea-weed.

Leuciscus. A genus of fishes including the dace, chub, minnow, and the like.

Levant (*Fr.*). The east, or place of sunrise. The term is applied to those countries which are washed by the eastern part of the Mediterranean Sea. Also a cant-term used in England, meaning to run away without paying one's debts.

LEVANTER. A strong easterly gale frequently encountered in the Mediterranean.

Levantis. The crew of a Turkish galley.

Levee (*Fr. lever*, to raise). An artificial embankment on the banks of a river.

Level-error. The error of the transit instrument when the axis deviates from a horizontal plane.

Leveling. The art of ascertaining the difference in the heights of objects or places on the earth's surface.

Level Out. To continue a horizontal line from a given point.

Level of the Sea. The zero plane from which heights and depths are reckoned. As the actual sea-level is constantly varying with the tides, it is necessary to define more particularly the standard for comparison. The *mean* level of the sea is the middle plane between the levels of high and low water. Though the range of the tide may vary considerably, this mean level fluctuates within very narrow limits.

Level-lines. The horizontal lines which determine the shape of the body of a vessel.

Level, Spirit-. An instrument for ascertaining the horizontality of a line or plane. It consists of a hollow glass tube of uniform bore closed at both ends, and nearly filled with a fluid of great mobility, such as spirit of wine or sulphuric ether, an air-bubble remaining inclosed. The tube is not quite straight, but has a slight uniform curvature, the convex side being placed upwards. The air-bubble will always occupy the highest position, and this will be the middle point of the tube when the instrument stands in a perfectly horizontal position as regards its length. To ascertain the horizontality of a given line, the level is first placed upon it, and the position of the bubble noted; it is then reversed end for end, and the bubble must remain in the same position as before. For a plane the test must be repeated in a direction perpendicular to the first pair of observations. Astronomical levels are furnished with a divided scale by which the position of the ends of the bubble can be accurately noted.

Lever-engine. A modification of the side-beam (or *lever*) engine, in which the beams are levers of the second order, the fulcrum being at one extremity of the lever and the piston-rod connection at the other, the connecting-rod to the crank-pin being joined to the beam at some point between the two.

Levet (*Fr. lever*, to raise). A blast or call with the trumpet, corresponding, probably, with the reveille of the present day.

Levin (*Anglo-Saxon*). A word for lightning, now obsolete.

Levis. An ancient name for a small open boat.

Levy, Uriah P., Commodore U.S.N. Born in Pennsylvania; died in New York City, March 22, 1862. He entered the navy, March 29, 1812; was an officer of the brig "Argus," which escaped the blockade, took out Mr. Crawford, minister to France, and destroyed in the British Channel 21 sail, one of which had a cargo worth $625,000. On the capture of the "Argus" he was made prisoner, and held two years. Lieutenant, March 5, 1817; commander, February 9, 1837; captain, March 29, 1844. His last cruise was in 1858, as flag-officer of the Mediterranean Squadron. Commodore Levy was the mover of the effort to abolish flogging in the navy. He published a "Manual of Rules and Regulations for Ships of War." An ardent admirer of Jefferson, he became the owner of Monticello, the valuable estate once owned by that statesman, which, with all its stock, dwellings, pictures, etc., was confiscated by the Confederates in consequence of his devotion to the "old flag."

Levy. To conscript.

Lewer (*Eng.*). A corruption of *lever;* a handspike.

Lewis-hole. Formerly, a hole in the surface of a mortar for the admission of the *lewis*, an iron clamp which served as a handle.

Lewth (*Eng.*). From Anglo-Saxon *lywd.* A place of protection from the wind.

Libera Piscaria. A term in law, meaning free fishery.

Liberty. Permission given to a part of a ship's crew to go on shore for a stated number

of hours. *To break one's liberty*, to remain absent beyond the time authorized.

LIBERTY-DAY. A day upon which the crew are to have liberty.

LIBERTY LIQUOR (*Eng.*). Liquor that was formerly allowed to be sold to a sailor on board ship for the purpose of entertaining a visitor.

LIBERTY-MAN. One of the crew who has been granted liberty.

LIBERTY-TICKET. A paper which is sometimes given to a liberty-man, upon which is specified the extent and date of his liberty.

Libra, Constellation of (*Lat.* "The Balance"). The seventh constellation of the zodiac, coming between Virgo and Scorpio. It contains two principal stars, α^2 *Libræ*, the *North Balance*, and β *Libræ*, the *South Balance*, the former bisecting the line joining Spica and Antares, the latter with Spica and Arcturus forming a triangle.

LIBRA, FIRST POINT OF. The *autumnal equinoctial point*, one of the points where the ecliptic crosses the equinoctial, is so called because it is the commencement of the sign Libra.

LIBRA, SIGN OF. The seventh sign of the ecliptic, including from 180° to 210° of longitude. Owing to the precession of the equinoxes, the constellation Virgo, and not Libra, is at present in the sign. The sun is in Libra from September 22 to October 23. Symbol ♎.

Libration. In general, the moon always presents the same face to the earth, but she passes in her complex movements through certain changes of position which resemble oscillations or vibrations, and in consequence of these vibrations small portions of the opposite face of the moon are seen. These changes are called *librations*. There are three, libration in longitude, libration in latitude, and diurnal libration.

Liburna. An ancient galley used by the Liburni, or Adriatic pirates. It was propelled both by sails and oars.

License. The certificate given by a board of trade to a master or mate of a merchant vessel, showing him to be qualified for the position.

Lick. A slang term for flog or thresh. Also, to excel another. Work imperfectly done is said to have received "a lick and a promise," and an experienced seaman may be said to have received "a lick of the tar-brush."

Licorn. A short howitzer, used during the last century.

Lie a Hull. To lie with no sail set.

Lie Along. To careen with a beam wind. *To lie along the shore* is to coast, keeping the land in sight.

Lie Athwart. To lie across, as a vessel when lying to the wind across, or at right angles to the tide.

Lie By. To arrange the sails in such a manner that the effect of the wind upon one part will counteract its effect upon the rest, and check the vessel's headway.

Lie In. See LAY.

Lie Off. To remain at a distance.

Lie Out. See LAY.

Lie Over. To heel or careen with the wind.

Lie To. To head a ship as near the wind as possible during a gale, in order that she may be in the position of greatest safety. The helm is kept a-lee and sail set, which will steady the vessel and keep the head to the wind. The main topsail, close-reefed, main trysail, and fore storm-stay-sail are usually required for a full-rigged ship, but some ships lie to more easily with a different arrangement of sails.

Lieutenant. An officer of the navy holding equal rank with a captain in the army. Their duties on shipboard are those of watch-officers and navigators, or executive-officers of the smaller classes of vessels, and they take rank according to the dates of their commissions. See NAVIGATOR, WATCH-OFFICER.

Lieutenant-Commander. The grade in the navy next below that of commander, and holding equal rank with a major in the army. An officer of that grade is usually ordered as the executive-officer of the first-, second-, and third-rates, or in command of a fourth-rate vessel. See EXECUTIVE-OFFICER.

Lieutenant-at-arms (*Eng.*). Formerly, the junior lieutenant of a ship, who was detailed for drilling the crew with small-arms.

Life-belt. A belt of rubber, or one containing cork, to serve as a life-preserver.

Life-boats and Boat-detaching Apparatus. A life-boat is one especially built for use in storms, heavy seas, and broken water, where an ordinary boat could not venture without imminent risk of destruction. See LIFE-BOATS AND LIFE-RAFTS.

Life-boats in use on shipboard are usually boats calculated by their build to be particularly seaworthy. On men-of-war they are usually light cutters or the New Bedford whale-boat, than which, in proper hands, there is no better seaboat.

Being sharp at both ends and with great sheer of gunwale, they are well calculated for surf-boats, but must invariably be steered by an oar, and provided with a "drogue" when on such service.

The so-called metallic life-boat used so generally on passenger steamers is built by stamping out the sides of the boat from sheet-metal by hydraulic pressure, a corrugation resembling the seams of a lap-strake-built boat being given for stiffness. These sides are then fastened to a wooden keel, stem, and stern-post. An air-chamber is placed in each end, as without them, owing to the weight of the metal of which they are built, they would at once sink if filled with water.

Some English-built ships' life-boats have extra buoyancy given them by cylindrical air-tanks under the thwarts, like those just abolished from the American surf-boats.

In England, steam-cutters for ships' use have been made unsinkable by giving extra buoyancy with air-chambers in the bow and stern and along the sides.

When heavy ships' boats are to be sent into a surf or heavy sea, additional buoyancy may be given them temporarily by lashing small casks or water-breakers under the thwarts. They should be placed along the sides as much as possible to prevent the water from settling there if the boat is thrown on her beam-ends.

Richardson's tubular life-boat has been used to some extent in England as a surf-boat. It is made of two parallel tubes with the ends turned up and in, and carrying between them a framework to support the thwarts, masts, etc.

It is more a form of "balsa" or "catamaran" than a boat.

Detaching apparatuses are contrivances fitted

to ships' boats, and life-boats in particular, to readily free them from their "falls" or tackles at the will of the person in charge, or automatically when water-borne.

The inventions to accomplish this end are numberless, and in the patent records of the United States and Great Britain there are many hundreds. A commission was appointed by the English government about 1870 to look into this subject and select an apparatus for use in that country, but it was poorly advertised, and no definite action was ever taken.

The advantages gained by the use of a boat apparatus are the following: In the case of a man overboard or other emergency, the boat, with her crew in her, may be lowered nearly to the water and then dropped at the will of the operator without waiting to deaden the ship's headway, as would be necessary under ordinary circumstances. In heavy weather, with the vessel rolling and pitching, a favorable opportunity may be seized and the boat instantly freed and pushed clear. In case of fire or shipwreck, when it is necessary to abandon the ship, the boats may be lowered with all on board, except those stationed to lower, to a safe distance; those remaining on board can then come down the falls while they are yet taut and the boat clear of the water, and consequently in no danger of being capsized or swept away, and then at the proper moment she can be detached.

The oldest detaching arrangement in existence has been used for many years by the American whalers in the constant and dangerous boat-lowering they do. It is simply a rope-runner at each end of the boat by which she is lowered into the water, and they are allowed to unreeve as the boat is swept away. This, though very simple, has the disadvantage of requiring a second set of falls to hoist by. The runners must also be tended by two skilled men on the vessel, who must act in unison to place the boat in the water at the proper moment. A kink in the rope in unreeving is also apt to capsize the boat unless quickly cut.

The first regular apparatus intended to obviate some of these defects came into use in the U. S. navy about 1859, and was the invention of Hunter Davidson, then a lieutenant in the navy. His apparatus also lowered and detached by one set of falls and hoisted by another, but it was detached in the boat itself at the will of the person in charge. There was no chance of a foul after it was once started, and one man lowered both ends of the boat at once.

The objections to this and most of the many others that have followed it in this and all other maritime countries have been, that they were complex, easy to get out of order, hard for the ordinary sailor to understand and manage, and in many cases cumbersome, taking up the best part of the boat.

A good boat apparatus should be very simple, easily understood and managed by the dullest coxswain, not liable to accidentally detach the boat, or detach her when lifted by a sea, either at the davit-heads or while lowering, as in the latter case especially only one end might be freed and the boat surely swamped. It should not encumber the boat in any way, and especially should it not be in the way of the crew. It should provide a simple, easy method of hooking on when the boat returns; for this is one of the most difficult parts of the operation of handling a ship's boat in heavy weather, and is a point which the inventors of boat apparatuses have almost universally neglected, thinking it quite sufficient to get their boats clear of the ship, and not realizing that it is quite as important at most times to get her back again readily.

An apparatus is found especially convenient in a stern boat, as it is sometimes very difficult to unhook the ordinary falls in a tide-way, as the boat is swept astern as soon as she touches the water. Boat-detachers have, like all other innovations, had opponents among professional men, but the necessity for a good contrivance of this kind is now generally acknowledged by all who understand the subject and are not influenced by mistaken economy to object to the outlay necessary to so provide their boats.

The writer has knowledge of several lives saved which would have been lost but for the time gained and facilities given by a "detacher," and no one can deny that the long death lists from steamboat disasters, now filling the papers in this month of June, 1880, might have been smaller if these vessels' boats had been properly provided in this and other respects. Ships' life-boats should always be ready to lower at a moment's notice, but it too often happens that what might be gained by an apparatus is more than lost by reversed davits, foul falls, lashings, boat-covers, etc., and such will continue to be the case, in passenger vessels at least, until public sentiment forces a law covering these points, and then sees it carried out.—*W. M. Wood, Lieutenant U.S.N.*

Life-boats and Life-rafts. For the best types of life-boats it is necessary to look to those nations whose citizens have given the most attention to saving lives from wrecked vessels. In 1784, Lionel Lukin designed an "unimmergible boat," and four years later Henry Greathead, a boat-builder, also of Great Britain, built a boat; the rudimentary points of these boats have been developed, and will be briefly described as they exist.

To the "Royal National Institution for the Preservation of Life from Shipwreck," founded in Great Britain in 1825, is due in a great degree establishments for the same object by other peoples as national institutions, usually adopting the life-boats, or the principles of their construction, to some extent.

The life-boats of Great Britain are of two types, one self-righting and self-bailing, the other very difficult to upset but not self-righting; both are insubmergible. The largest of the first named are 40 feet long, 10½ feet beam, and 5 feet deep amidships. They have metal keels of from 600 to 1500 pounds weight, and have the same weight in cork as of ballast, confined beneath a water-tight deck at the load-line. The boat is propelled by 12 oars, and her buoyancy, when swamped or capsized, is due to air-cases at the ends and along the inside of the boat, aided, even when stove, by the cork-ballast, and when not stove, the floor part of the boat acting as an air-chamber, being covered by a water-tight deck before mentioned. The sheer of the boat is considerable; the elevated end air-chambers, aided by the weight of keel and ballast, cause her to right if upset. Should a sea fall on

board it would fill up the space above the water-tight deck at the load-line, and would at once discharge itself through valves. The weight of the boat causes a draft of 22 inches, and makes launching and landing difficult, but, on the other hand, gives great steadiness in a heavy sea. Sails are used at will. The usual weight is 4000 pounds; these boats are of the "diagonal build," usually of mahogany, but sometimes of fir-wood. The means of transportation along a beach is a wagon of 2000 pounds weight, drawn by horses.

The other type of life-boat is from 36 to 40 feet in length, and from 10½ to 12 feet beam; sails are employed, and the boat is heavily water-ballasted, on the general principle of being "water-logged," and, when filled, making the water incapable of shifting; this also as the first-named type has an iron keel of about the same weight. Of the 270 life-boats of the British Institution, 21 have not the principles of construction which make them self-righting.

The "surf-boat" usually employed on the eastern coast of the United States in the Life-Saving Service, is, as the life-boat, insubmergible, but not self-righting and bailing, and though inferior in strength, has the advantage in lightness for passing through surf. It is surrounded by a cork fender, is fitted with life-lines for persons in the water, and is easily managed under the lee of a wreck from its lightness. The boat is propelled by oars and requires a crew of 7 men.

Several of our harbors on the Northern lakes are furnished with English life-boats, there being facilities for lowering or launching them. In general, from the shoal character of the water on the Atlantic coast of the United States, the surf-boat has been found well adapted and more useful than the English life-boat would be. A modification of the last named, self-righting and self-bailing, but of much less weight and draft, is now introduced at some points on the Atlantic coast where bold water and other facilities exist for launching.

For some years merchant steamers have been furnished with galvanized sheet-iron cylinders having conical ends, yoked in pairs at some space apart by a frame-work, having slats between them arranged in such manner that, if capsized, the oars attached can be used. The cylinders composing the raft are in several parts or water-tight sections, held together by a connecting rod.

Vessels of war of the United States are furnished with what is known as the "Ammen balsa," or raft. It is composed of two casks of wood with oval cross-sections, having a slight taper from the centre towards the ends. Five feet from the ends the staves of the floor and sides are so beveled as to make very small heads to the casks, and forming almost a straight back. The casks are yoked together at a space apart equal to the superior diameter of a cask, and slats are screwed from beneath between them so as to make a platform. The largest size issued to the navy has a length of 23 feet, and as yoked, 5 feet broad; weight, with oars, mast, and sail, 945 pounds, with a possible displacement or buoyancy of 5225 pounds. It pulls fairly, and when fitted with a centre-board will beat to windward in a heavy breeze and sea. The casks have scuttles fitted with thumb-screws, which permit them to be stowed with water, provisions, or other articles, and then made water-tight.

The "india-rubber balsa" has been in use since 1837. It is composed of two or more air-tight bags with apparatus for inflating them, and a frame-work of wood to keep them in position. It is comparatively light and portable.

"Balsas," or life-rafts, have been supposed defective as life-boats for use from the shore on account of the great difficulty, if not impossibility, of getting them off a beach through a heavy surf in the face of a gale. This difficulty could be obviated by planting disks of iron, with chains attached at such points as might be thought advisable.

Comparing the different life-rafts: the first named are heavy in comparison to their sustaining capacity, and have small power of locomotion by sail or oars; the second have a great capacity to sustain a load as compared with their weight, and can be made by any cooper or boat-builder, without royalty. If they should be capsized the sustaining power is not diminished, and they can be righted in the water by a number of persons acting together, or by few persons, if one of the casks is allowed to fill partially with water. They pull and sail fairly, and afford the facility of placing water and provisions within them. If made to sustain the dead-weight of 60 men, they need not weigh more than 1000 pounds. If injured, as the pressure is from without, a patch of lead, canvas, or wood will serve, or even a rag punched into the hole. Their applicability for passenger steamers and ships, from comparative small weight and cost, would seem obvious.

India-rubber "balsas" are liable to injury from heat and moisture, and become useless if torn or punctured, as they are very liable to be; the pressure being from within, the escape of air would destroy the buoyancy. They would be useless on a rocky shore, and are necessarily expensive.

The following may be deduced from the above: no life-boat is known which, under all circumstances of beach, facilities or difficulties of launching, etc., is unequivocally the best. For the use of vessels life-rafts may have the following advantages over boats: a greater sustaining power at less cost, and with less weight proportionate to their sustaining power; relative ease of getting them overboard in a sea-way without injury, and if the pressure is from without, very easily repaired when injured. Add to this the impossibility of swamping, and the ease with which the life-raft could be righted if capsized in launching, which would, under the same circumstance, render the boats ordinarily carried by ships entirely useless.—*Daniel Ammen, Rear-Admiral U.S.N.*

Life-buoy. A structure intended to save the life of a person who may have fallen into the water. That in general use in the navy consists of two metallic cylinders connected by a central spindle, to the upper end of which is fixed a port-fire. The frame-work at the lower end of the spindle serves as a resting-place for the feet. One life-buoy is attached to each quarter, and is let fall into the water by means of a knob, which being pulled, detaches the buoy from the ship. If required for use at night, another knob is first pulled, which ignites the port-fire by means of a hammer and percussion-cap. The burning of

the port-fire indicates the position of the buoy. A small red flag is attached to the spindle by day to assist in keeping the buoy in sight. Circular buoys are also used, which may be cut clear of a vessel's stern, or thrown to a person in the water.

Life-kite. A kite contrived for the purpose of sending a line from a wreck to the shore, as a means of escape from the vessel.

Life-line. A rope stretched about the deck during a gale, by which the men can save themselves from being washed overboard by heavy seas. A life-line is also extended from the lift to the mast above each yard-arm, and serves as a support to the men in manning yards.

Life-preservers. Devices for preserving the buoyancy of the human body, and for reaching the shore in cases of shipwreck or other casualty afloat. The favorite material of their construction is cork. It has been calculated that one pound of cork is amply sufficient to support a man of ordinary size and make. The cork life-preservers have generally the form of a jacket or a belt, and a great variety of them have been patented. A life-buoy held in high esteem among sailors is composed of slices of cork, neatly and compactly arranged so as to form a buoyant zone of about 30 or 32 inches in diameter, 6 in width, and 4 in thickness. It contains about 12 pounds of cork, and is generally covered with painted canvas to add to its strength and protect it from the injurious action of water. A buoy so constructed can sustain six persons, and it is generally furnished with a life-line (a cord running round the outside of the buoy and fastened to it at four points) to afford a more convenient hold. A few years ago, on the invention of india-rubber cloth, inflated belts of this material were made, and found to be superior in buoyancy to the cork belt, besides, when emptied of air, being very portable. They are, however, much more liable to damage by being punctured or torn, or to decay by being put away while damp. Some of these defects are remedied by having the interior of the belt divided into several compartments, so that when one is damaged the remainder may suffice. Their susceptibility to damage, however, by want of care and the effects of climate militates strongly against their general use. Mattresses stuffed with cork have been extensively used, and are highly effective as life-preservers. Faced with one-inch thickness of horse-hair, they are very comfortable for ordinary purposes, and are preferred by many to those made wholly of hair. The buoyancy of the cork mattress may be increased by means of a water-proof sheet, which, placed within a hammock, enfolds the mattress and bedding. Mr. R. B. Forbes, of Boston, who has devoted much time and attention to the subject of life-saving appliances, has shown by experiment that a common hammock and a hair mattress put into a water-tight bag securely tied at its mouth would float indefinitely with two 32-pound shot attached to it. The chairs, benches, stools, seats, cushions, and many other articles of equipment about ships may be made valuable as life-preservers by being rendered air-tight or fitted with air-tight attachments. See Life-boats and Rafts.

Life-saving Service of the United States. This admirable and beneficent institution was organized by act of Congress, approved June 18, 1878. Its purpose is sufficiently indicated by its title, and it is unique as being the only exclusively governmental establishment of the kind in the world. Previous to its organization the principal efforts in the direction of succoring shipwrecked voyagers along our coasts had grown out of the operation of the Massachusetts Humane Society, which, as early as 1789, had caused huts to be erected at some of the most desolate points on the coast of Massachusetts for the shelter of shipwrecked persons fortunate enough to reach the shore. The first life-boat station was established by this society at Cohasset in 1807, and subsequently others were added. The society received from time to time pecuniary aid from both the general and State governments, by which it was enabled to extend and improve its operations. Although relieved of a portion of its self-imposed task of benevolence by the organization of the governmental establishment, it still exists, and efficiently supplements the operations of the latter in alleviating the distress of shipwrecked mariners on the Massachusetts coast. Similar societies have at times existed in other parts of the country, but they have now, for the most part, either discontinued their organization, or diverted their operations into other channels. The first step toward a distinctively national life-saving service was the appropriation by Congress in 1848 of $10,000 for providing surf-boats and other appliances for rescuing life and property from shipwreck on the coast of New Jersey. Eight buildings were erected at different points on that coast, and were fitted with the necessary appointments. This was followed by an appropriation of $20,000 in 1849, with which 8 buildings were built and furnished on the coast of Long Island, and 6 added to those previously erected in New Jersey. In 1850 Congress made another appropriation of $20,000, half of which was expended in establishing additional stations on Long Island, and one at Watch Hill in Rhode Island, and the other half in placing life-boats and boat-houses at different points on the coasts of North and South Carolina, Georgia, Florida, and Texas. Appropriations amounting to $42,500 were made to the Life-saving Service in 1853–54, with which 14 new stations were added to those on the New Jersey coast, and 11 to those on the coast of Long Island. Twenty-three life-boats were distributed along the shores of Lake Michigan, and others were placed at different points on the Atlantic and Lake coasts. Exclusive of the boats at the 55 stations on the New York and New Jersey coasts, there were in 1854 82 life-boats at different localities elsewhere. The same year Congress passed an act, under the provisions of which a superintendent at a compensation of $1500 per annum was appointed for each of the two coasts; a keeper was assigned to each station at a salary of $250; the stations and their equipments were made serviceable, and bonded custodians were secured for the life-boats. The service, however, still lacked drilled and disciplined crews, regulations, and a central energetic administration of its affairs. An effort made in 1869 to procure from Congress an appropriation to provide for crews of surfmen, resulted in securing these crews for each alternate station, and in 1871 the Secretary of the Treas-

ury, to whose department the Life-saving Service —owing to its relation to commerce—belongs, was authorized to employ crews of surfmen at such stations and for such periods as he might deem necessary. From that year the present organization of the service may be said to date. An appropriation of $200,000 was made by Congress for its support, and an efficient chief was found in the person of Mr. Sumner I. Kimball, who, in February of the same year, had taken charge of the bureau of the Revenue Marine Service, to which the administration of the Life-saving Service at that time belonged. Setting vigorously to work, Mr. Kimball, by means of thorough inspection, acquainted himself accurately with the existing state of the service and the steps necessary to remedy its defects, and so satisfactory were the results of his efforts that the record of the season's operations (1871–72) on the coasts of New Jersey and Long Island, where the system had been most fully developed, show that every person imperiled by shipwreck was saved. The success of this season stimulated renewed effort and encouraged further development. New stations were established; a code of regulations was prepared, and improved apparatus was selected for the stations, including the New Jersey cedar surf-boat, an *éprouvette* mortar, the india-rubber life-saving dress invented by Mr. C. S. Merriman, and Coston night-signals. Without attempting to follow year by year the successive stages of development, it must suffice to say that, under the fostering care of Congress and efficient administration by its chief, the Life-saving Service continued to improve and expand, until it had so demonstrated its usefulness that, on the 18th of June, 1878, Congress passed an act detaching it from the Revenue Marine and erecting it into a separate and definite establishment. As now organized the establishment embraces 12 districts, comprising 195 stations, which are divided into 3 classes, known respectively as life-saving stations, life-boat stations, and houses of refuge. The following table shows the location of the districts, and the number and class of the stations belonging to each district:

Districts.		Stations.	
No.	Coasts.	No.	Class.
1	Maine and New Hampshire	7	Life-saving.
2	Massachusetts	15	"
3	Rhode Island, Block, and Long Islands	38	"
4	New Jersey	40	"
5	Delaware, Maryland, and Virginia to Cape Charles.	11	"
6	Virginia and North Carolina, from Cape Henry to Cape Fear	25	"
7	Florida	5	Houses of refuge.
8	Gulf of Mexico	6	5 life-saving. 1 life-boat station.
9	Lakes Erie and Ontario	9	3 life-saving. 6 life-boat stations.
10	Lakes Huron and Superior.	13	10 life-saving. 3 life-boat stations.
11	Lake Michigan	18	5 life-saving. 13 life-boat stations.
12	Pacific	8	Life-boat stations.

The life-saving stations have houses two stories in height, and from 18 to 20 feet wide, by 40 to 45 feet long. They are neat and tasteful in appearance, and contain on the ground-floor 2 rooms, one, the boat-room, about 10 by 16 by 30 feet, which opens to the weather by a broad double-leaved door. In this are stored the boats, life-car, wreck-gun, and most of the apparatus. The other room, measuring about 8 by 12 by 16 feet, is the common living-room of the crew. In the second story are 3 rooms, one for storage, one the keeper's sleeping-room, and one that of the men, these two sleeping-rooms being furnished with some extra cots for use in emergency. At stations having signal-service communication there is an additional room in the upper story for the signal-officer.

The houses at life-boat stations are usually 24 feet from base to peak, 42 feet long by 22 feet wide, outside measurements, and contain a loft above, and a room below 12 feet high, 20 feet wide, and 40 feet long, for the accommodation of the life-boat and its gear. They stand on piles at the water's edge or on the inner side of the piers, and are furnished with an inclined platform or trap in the floor, along which the life-boat is let down and launched by means of a windlass.

The houses of refuge, which exist only on the Florida coast, are two-story structures, having broad gabled roofs, a veranda 8 feet wide on three sides, and large chimneys in the rear, built outside the wall. They are of pine, elevated about 6 feet from the ground, and the roofs are shingled with cypress. The windows are fitted with wire-gauze mosquito netting in place of glass. The houses are about 37 feet long by 15 wide, not including the veranda space. The lower story has 3 apartments, the upper is not divided into apartments. Each house has capacity for succoring 25 persons, and has a 10 days' supply of food for that number. A boat-house is provided for each station, furnished with a galvanized iron boat with sculls.

The *personnel* of the Life-saving Service consists of a general superintendent and an assistant general superintendent, their headquarters being in the Treasury at Washington; an inspector of life-saving stations, who is an officer of the Revenue Marine; 2 superintendents of construction of life-saving stations, who are also officers of the Revenue Marine, and who supervise the erection and repairs of buildings, and the purchase of equipments for new stations. Their office is in New York. An officer of the Revenue Marine is assigned to each district as assistant inspector, his duty being to see that the stations and their equipments are in proper condition, and the crews proficient in the use of the life-saving apparatus. The districts are severally in charge of a superintendent, who is appointed after examination, and is required to be an inhabitant of the region, familiar with the coast, and with the action of surf and the use of surf-boats and other life-saving apparatus. He is responsible for the condition and conduct of his district, makes requisition for all repairs, outfits, and supplies therein necessary, pays the crews, keeps the accounts, and conducts the correspondence. For the Rhode Island portion of the third district there is also an assistant superintendent, who resides at Block Island. The superintendent nominates the keepers of his district, who are subject to an exami-

nation by a board consisting of the local inspector, a surgeon of the Marine Hospital Service, and an expert surfman. Each station is in charge of a keeper. He selects his own crew, subject, however, to the revision of the Examining Board. He is by law an inspector of customs, and has authority to take charge of stranded property, and to prevent smuggling. He keeps inventories of all property pertaining to his station, and a journal of events, weekly transcripts of which are sent to the general superintendent. He is responsible for the good order of the station and its appointments, commands the crew, and conducts all operations. At complete life-saving stations the keepers are required to reside constantly with their crews during the active season. At life-boat stations, with only volunteer crews, the keepers must live in the neighborhood, keep sharp look-out for vessels in distress during thick weather, and rally their men upon occasions of need. At houses of refuge the keepers live with their families the whole year, and after storms the beach is thoroughly searched to the greatest extent practicable in both directions for persons cast ashore, who, when found, are succored and tenderly cared for. The crews of life-saving stations consist of 6 men, who are required to be hardy and skilled surfmen. They constantly patrol the beaches at night with lanterns and night-signals, and also watch by day, especially in thick weather. This system of patrolling is a distinctive feature of the United States Life-saving Service, and its proved value in speedily discovering stranded vessels causes it to be maintained with great vigilance, the manner of its performance to be strictly watched, and any evasion of duty in connection with it to be promptly punished. The volunteer crews at the life-boat stations are groups of 8 persons besides the keeper. They are regularly enrolled, and are required to be vigilant to observe the signal for their assembly in thick or stormy weather. See LIFE-BOATS AND RAFTS, LIGHT-HOUSE ESTABLISHMENT, WRECK ARTILLERY, DROWN.

Lift. To shake slightly, as a sail when the wind blows against it at too small an angle. To raise, as a vessel, when lifted out of the water by a floating-dock. Fog is said to *lift* when it rises from the surface of the water. A promotion is sometimes called a *lift*. "*Give me a lift*" is a request for assistance in work. A *lift* is a rope which extends from the mast-head to each end of a yard to support the yard-arms. A yard is "*on the lifts*" when its weight is supported by the lifts. A *topping-lift* supports the outer end of a lower studding-sail boom and a spanker-boom.

LIFTING-JACK. A portable machine for lifting heavy objects.

LIFTING-PUMP. One by which the liquid is lifted by the piston, instead of being forced to the place of discharge.

LIFTING-ROD. The rod which receives motion from the rock-shaft of the valve-gear, and imparts motion to the poppet, or other lifting-valve.

LIFTING-TOE. The revolving arm on the rock-shaft of the valve-gear, which takes against the toe on the lifting-rod and thus transmits motion.

Lig (*Eng.*). A small fish-hook with lead cast on its upper end to serve as a sinker.

Ligan. A term in maritime law signifying goods that are sunk in the sea, but whose position is marked by buoys.

Ligger (*Eng.*). A contrivance for taking pike at night.

Light. Small; inconsiderable. Not dark. The term for all lamps or lanterns used on shipboard; as, *running lights*, *signal-lights*, *mast-head lights*, etc. (See LANTERN.) Open lights on the berth-deck require to be extinguished on a ship of war at 8 P.M., in the steerage at 9 P.M., and in the ward-room at 10 P.M., unless permission is given for an "extension of light" by the commanding officer. To lift or carry anything along the deck; as, "to light along a rope." *To light over to windward* is to haul the reef-band to windward when reefing a sail. A ship is *light* when she has no cargo, or is not deeply immersed; and she is said to be *flying light* when she is crank for want of ballast or cargo.

LIGHT AIR. Wind of least force. It is indicated by the figure 1 in the scale, where 0 represents a calm and 12 a hurricane.

LIGHT-BALLS. Balls sometimes used in military operations for lighting up the enemy's works at night. They are composed of inflammable substances, such as sulphur, saltpetre, and resin, with oil, and burn with great brilliancy in mid-air when fired from a mortar.

LIGHT-BOX. The place, adjoining a magazine or shell-room, for the magazine-light. The light is transmitted to the magazine through a thick glass plate.

LIGHT BREEZE. A steady wind, whose force in indicated in the scale by 2.

LIGHTEN. To relieve a vessel in stress of weather by throwing overboard cargo or any heavy weights.

LIGHTER. A large flat-bottomed barge or boat used in transporting cargo between a vessel and the shore. It is built with great strength, and may be open or covered with a deck, according to the kind of merchandise which it is intended to carry.

LIGHTERAGE. The price paid for the use of lighters, or the cost of transporting a vessel's cargo in loading or unloading by lighters.

LIGHTERMAN. A man who is employed on a lighter.

LIGHT-HANDED. Short-handed. A crew smaller than the complement allowed.

LIGHT-HORSEMAN (*Eng.*). An old name for the gig.

LIGHT ICE. Thin ice.

LIGHT-PORT. Any port used to admit light into the hold of a vessel.

LIGHT SAILS. Topgallant sails, royals, flying-jib, and studding-sails.

LIGHT-SHIP. A small vessel constructed for the purpose, and furnished with one or two large lanterns of great illuminating power. They are anchored upon shoals or in the vicinity of dangers to which vessels are exposed, either on the coast or in harbors.

LIGHT WATER-DRAFT. The draft when the hull is entirely empty.

LIGHT WATER-LINE. The line of immersion of a vessel when unloaded.

Light-house Establishment (The), of the United States is not a creation: it is a growth. The first light-house was built on Little Brewster Island, Boston harbor, Mass., in 1715-16, by

order and at the expense of the General Court of the Province of Massachusetts Bay, at an outlay of £2385 17*s.* 8½*d.*, and it was supported by "an impost of 1*d.* per ton inward and 1*d.* per ton outward" on all passing vessels except coasters, paid to the collector of imposts at Boston. Other lights were erected on various parts of the coast as the necessities of commerce required, so that in 1789 there were 25 light-houses: 2 in Maine, 1 in New Hampshire, 10 in Massachusetts, 1 in Rhode Island, 2 in Connecticut, 1 on Long Island, N. Y., 1 on Sandy Hook, N. J., 3 in Virginia, 1 in North Carolina, 1 in South Carolina, and 1 in Georgia.

The United States, by act of 7th August, 1789, assumed, with the consent of the States owning them, the control, proprietorship, and maintenance of these lights, and placed them under the management of the Secretary of the Treasury, who devolved their superintendence upon his subordinate, the Commissioner of Revenue, until July, 1820, when his office was abolished, and the duty was assigned to the Fifth Auditor of the Treasury, who, in 1852, turned it over to the Light-House Board, by which it is still exercised.

In 1789 there were 25 light-houses; in 1820 there were 55; in 1838 there were 210 light-houses, 28 light-ships, and numerous buoys and beacons; in 1852 there were 325 light-houses, 42 light-vessels, more beacons and more buoys; and now the number of lights has more than doubled, various other aids to navigation have been devised, and the establishment has increased many fold in usefulness.

Collectors of customs have had certain limited and local care of lights and light-keepers from the first. Since the charge of the lights was assumed by the general government the method of caring for the *personnel* of the establishment has been subjected to frequent modification; and now those collectors, who are also superintendents of lights, have nothing to do with light-houses, and no further connection with the keepers than to nominate them for appointment, and in most instances to pay them their wages. In the beginning collectors contracted for the erection of light-house buildings, and the purchase of all the material used in building, operating, and maintaining the lights. When the Fifth Auditor became general superintendent he took supervision of these contracts, and in some instances made them himself, and he attempted the formation of a system which had in it germs of success. But the needs of commerce increased more rapidly than this crude plan could meet them. Hasty legislation overran itself, and Congress became aware of the necessity for revising its own action. Hence, in May, 1838, it created a board of naval officers to examine and report as to the lights which were actually needed, and also as to how those needs were met by existing lights and by those to be erected. On the report of that commission Congress took such action that the erection of 31 lights, for which appropriation, plans, and, in some instances, contracts had been made, was stopped; the coasts were divided into 7 districts, a young and active naval officer was assigned to each, and appropriation was made for the purchase and practical test, in light-houses, of two sets of French lenticular apparatus. These officers, who were required to report among other things as to the plan, site, and need for each proposed light-house, did their duty so thoroughly that Congress for the first time had a full and clear knowledge of the real needs of commerce, and was enabled to provide for and meet its immediate necessities.

But the wants of shipping again outgrew these new plans, and complaints were so numerous and specific that, in March, 1851, another, and now a mixed, commission was raised, and required by law "to inquire into the condition of the light-house establishment, and to make a general detailed report and programme to guide legislation in extending and improving our present system of construction, illumination, inspection, and superintendence." This commission, which was composed of three naval officers, two army officers, and the superintendent of the coast survey, made a thorough examination of existing aids to navigation, compared them with those of France and other maritime countries, which were visited for the purpose, and then prepared a plan which was intended to combine the best features of the various foreign systems, to adapt them to the ascertained wants of this country, and to provide for its wants in the future. This plan, which was submitted with a full report, was adopted in the main by Congress, and the act of August 31, 1852, created the Light-House Board, placed the Light-House Establishment under its direction, attaching it to the office of the Secretary of the Treasury, making him its president, and placing it under his superintendence. This board was directed by the organic act "to discharge all the administrative duties relating to the construction, illumination, inspection, and superintendence of light-houses, light-vessels, beacons, buoys, sea-marks, and their appendages, and embracing the security of foundations of works already existing, procuring illuminating and other apparatus, supplies and materials of all kinds for building and rebuilding when necessary, and keeping in good repair the light-houses, light-vessels, beacons, and buoys of the United States."

The new board was composed of 9 members: 3 officers of the navy, two of high rank, 3 officers of the corps of engineers of the army, and 3 civilians, one of whom was to be the Secretary of the Treasury, and the remaining two to be of high scientific attainments. The members of the commission were appointed on the board, which was completed by adding to it Prof. Joseph Henry, the secretary of the Smithsonian Institution, and Capt. E. L. F. Hardcastle, of the corps of engineers, when it was organized by making Commodore Shubrick its chairman, Lieut. Jenkins its naval secretary, and Capt. Hardcastle its engineer secretary.

The board then commenced making the recommended reforms. The coasts of the Atlantic, the Gulf of Mexico, the Pacific, and the great lakes were divided into 12 districts, to which the two districts constituting the great Western rivers were added in 1874; and an inspector and engineer, who was in each case an officer of the army or navy, was assigned to each district. The inspectors, under the special direction of the naval secretary,—who also had charge, in the absence of the chairman, of the office of the board,—were charged with the maintenance of light-houses and lights, and with the discipline

of the light-keepers; and the engineers, under the direction of the engineer secretary, were charged with building the light-houses, with keeping them in repair, and with the purchase, the setting up, and the repair of the illuminating apparatus. Both inspectors and engineers were required to make regular and special reports to the board, acting always under its direction; and the board was required to make a full annual report to the Secretary of the Treasury, who in turn reported to Congress.

The board divided itself into committees on engineering, lighting, floating aids to navigation, location of light-houses, experiments, and finance, and placed an expert in that branch at the head of each. Its committee meetings were frequent, and the board itself met at least monthly, though required by law to meet but quarterly, while the executive committee, consisting of the chairman and the two secretaries, were in constant session, and carried on the business of the establishment. The individual members of the board had much work to do along all the coasts of the country, and thus became familiarized with the minutest details of the service, which was soon placed on the best possible footing. Then the board set about making all desirable improvements as fast as existing laws and funds in its control would permit.

It substituted for the old parabolic reflectors the lenticular illuminating apparatus of Fresnel, making at once a great saving in expense for oil, and a great increase in the light produced. It substituted light-houses for light-ships where possible, making large saving in expense for maintenance in each instance, again with a corresponding increase in light. After a long course of experiments, in which it was joined by some of the first scientists of the country, the board found it possible to substitute as an illuminant, lard oil for sperm, and invented and manufactured lamps in which to burn it, with a further saving in cost and another increase in the power of the light. After a series of experiments into the nature and action of sound in wind, rain, fog, and snow, running through many years, with published results, stimulating private enterprise and ingenuity, it tested and finally adopted a number of fog-signals, operated by steam, hot air, or by the action of the waves, and appropriately placed them as rapidly as funds were provided by Congress, and brought that part of the service into such perfection that mariners were satisfied to be guided by sound when sight was impossible, and that other maritime nations sent commissions here to study our methods. It inaugurated a simple and inexpensive system of lighting the great Western rivers, which is so successful that steamers, which formerly tied up on dark nights, now run as in daylight, thus revolutionizing the river commerce of the country. It has recently, after another exhaustive series of experiments, as a measure of economy, substituted mineral oil for lard oil as an illuminant in its lights of the lower orders, certainly with no loss of light thereby. It has so far pushed its experiments into the use of the electric light as to become sensible of its possibilities for light-house illumination, and to ask Congress—thus far unsuccessfully, however—for funds with which to practically test it in a light-house.

The board has elevated the character of its *personnel*, and has, after long effort, succeeded in withdrawing the promotion and transfer of light-keepers, over a thousand in number, from politics and making them depend on merit. It has provided for light-keepers, in addition to a well-arranged volume of printed instructions, some 250 small libraries, each containing about 50 volumes of general literature, which pass from light-station to light-station as they are read; and it is within its plans to place the service on a still higher footing. The members of the board serve without any pay additional to that which they receive by right of position in the army, navy, or civil service. They now are, and as a rule they have been, persons of scientific attainments, and because they were noted as such were detailed for light-house service.

On July 1, 1880, the Light-House Establishment had in position 47 first-order lights, they being the largest, 26 of the 2d order, 55 of the 3d order, 10 of the 3½ order, 204 of the 4th order, 288 of the 5th and 6th order; 24 lanterns and lenses, 819 stake-lights on the Western rivers, 31 light-ships, 57 fog-signals, operated by steam or hot air, 25 automatic whistling-buoys, numerous day-beacons or monuments, and 3115 other buoys.

The establishment is entirely supported by the general government, without making any charge in the way of light-dues against vessels of any country. Its cost may be predicated upon appropriations made for the support of the establishment during the fiscal year ending June 30, 1881, which were as follows:

For salaries of keepers of light-houses, at an average of $600 each, $565,000; for expenses of light-vessels, $240,000; for expenses of buoyage, $325,000; for expenses of fog-signals, $50,000; for inspecting lights, $4000; for supplies of light-houses, $375,000; for repairs of light-houses, $285,000; for erection and repair of pier head-lights, $25,000; for lighting and buoyage of the Mississippi, Missouri, and Ohio Rivers, $140,000; for survey of sites and preparation of plans of light-houses, $10,000. Total for maintenance of the service one year, $2,019,000. For the erection of new light-houses and the building of new light-vessels, $476,700. Grand total, $2,495,-700.—*A. B. Johnson, Chief Clerk Light-House Board.*

Lightning-conductor. A small rope of copper wire which extends from the truck of each mast to the metallic sheathing on the vessel's bottom. The upper end of the wire rope terminates in a steel point, tipped with platinum, which is fastened to the upper side of the truck.

Lignamina (*Eng.*). Timber for building purposes.

Lignite. Fossil wood carbonized to a certain degree, but retaining its woody texture. See Coal.

Lignum-vitæ. A tree (*Guaiacum officinale*) found in the West Indies and Central America. On account of the extreme hardness of its wood it is valuable for the sheaves of blocks.

Limb. A portion of the disk of the sun or moon. The graduated arc of a mathematical instrument.

Limbers or Limber-holes. The holes cut through the floor-timbers for the passage of water on each side of the keelson.

Limber-board. A short plank fitted into the

floor of a vessel, which can be removed when necessary to clear the limber-holes.

LIMBER-CHAIN. A small chain rove through the limber-holes or limbers, by moving which the holes can be cleared of dirt, and passage given for the water in the bottom to run into the pump-well.

LIMBER-PLATE. See LIMBER-BOARD.

LIMBER-STREAK. The plank in the floor of a vessel nearest the keelson.

Limbo. A place of confinement.

Lime-juice. Issued in the English naval service as a part of the ration, on account of its antiscorbutic qualities.

Lime-pot. A pot for holding lime, which was used in the early time of European naval engagements for its blinding effects upon the enemy.

Limerick, the leading port of Ireland, is situated on an extensive plain at the interior extremity of the estuary of the Shannon, in lat. 52° 39′ 36″ N., lon. 8° 39′ W. The harbor is about 1600 yards in length by 150 in breadth, with from 2 to 9 feet at low water and 19 feet at the spring tides. The commerce of the port is considerable. The manufacture of lace and fish-hooks has supplanted that of gloves and linen, for which this city was at one time celebrated. There are also distilleries, breweries, ship-building yards, flour-mills, and foundries. Pop. 40,000.

Limiting Parallels. The most northern and southern parallels of latitude within which occultations of the stars or planets with the moon can take place.

Limmer (*Eng.*). The man-rope at the side of a ladder.

Limnoria. A genus of crustacea of the order *Isopoda*, containing only one known species. It does great damage by eating into docks, piles, and other wood-work immersed in the sea. The kyanizing of wood and other expedients have been resorted to to prevent its ravages.

Limpet. A shell-fish of the genus *Patella*, found adhering to rocks.

Linch-pin. An iron pin by which the truck of a gun-carriage is secured upon the axle.

Line. A common term for the equator. The word is applied to many ropes of different sizes which are used for various purposes on shipboard; as, *bow-lines*, *bunt-lines*, *clew-lines*, *leech-lines*, *spilling-lines*, etc. (See SAILS.) Also, marline, houseline, roundline, etc. (See SMALL STUFF.) A small hawser used in towing is called a *towline.* A small rope used for hauling the end of a hawser on board is called a *hauling-line.* A *tripping-line* is used for clearing the lower lift and brace from the yard-arm in sending down a topgallant or royal yard. *To line*, to mark out work in ship-building; to put such lines upon the work as will show its finished shape, to which the workmen are to cut. To place anything in its true position. Also, to protect anything with boards, sheet-iron, lead, etc.

LINES OF A VESSEL. The boundaries or curves generated by planes cutting the solid in different directions, the boundary or curve being defined by the contact of said plane with the surface of the solid.

They are, 1st. The "*water-lines*," which are generated by cutting the solid with horizontal planes.

2d. "*Cross-sections*," or frame-lines, generated by cutting the solid by vertical transverse planes.

3d. "*Vertical sections*," which are generated by cutting the solid with vertical longitudinal planes.

4th. "*Diagonals*," which are generated by cutting the solid with a plane whose contact with the "vertical longitudinals" is horizontal, but whose surface transversely is inclined, in order that the plane may approach a perpendicular to the surface of the solid at its point of contact.

Beam-line, a line showing the height of the beams at the sides of the ship. *Bearding-line*, the trace of the inner surface of the skin on the stem, keel, and stern-post. *Boundary-line*, the trace of the outer surface of the skin on stem, keel, and stern-post. *Bow-* and *buttock-lines*, the lines formed by the intersection of a vertical plane parallel with the plane of the keel, and the bow and quarter of the ship. *Centre-line*, any line formed by the middle, vertical, longitudinal section. *Cutting-down line*, a line on the sheer-plan, corresponding to the upper surface of the floor-timbers at the centre-line. *Diagonal lines*, lines formed by the passing of planes oblique to the plane of the keel, but intersecting that plane in lines parallel to the keel. *Level lines*, lines formed by planes perpendicular to the plane of the keel. *Main-breadth line*, the line which shows the greatest breadth of the ship. *Ribband-line*, the same as a diagonal line. *Sheer-line*, a line showing the upward curvature at the extremities of the ship. *Stepping-lines*, the lines upon which are stepped the heels of the cant-timbers,—the forward and after ends of the bearding-line. *Load water-line*, the line of flotation when the ship has her full cargo on board. *Light water-line*, the line of flotation when all the cargo is discharged.

LINE OF BATTLE. The line formed by the ships of a fleet at regular intervals ahead and astern, and nearly close-hauled upon either tack. This mode of forming line of battle applies rather to the former days of sailing fleets, where one of the objects of manœuvring was to obtain the weather-gauge of an enemy, than to the present age of ironclad vessels and steam.

LINE-OF-BATTLE SHIP. A ship carrying not less than 74 guns upon three decks, and of sufficient size to be placed in line of battle.

LINE OF BEARING. The position of the vessels of a fleet in line heading in any direction from which, by hauling upon the wind, a line of battle is formed. A fleet is on the starboard line of bearing when, by coming to the wind, the ships will be in line of battle on the starboard tack. Otherwise they are on the port line of bearing.

LINE OF COLLIMATION. The line which passes through the centre of the telescope of an astronomical instrument at the intersection of the cross-wires at its focus.

LINE OF FIRE. The prolongation of the axis of the bore of a gun when fired.

LINE OF FLOTATION. The horizontal line formed by the surface of the water on the outer surface of a vessel at different drafts.

LINE OF LINE. One of the lines upon Gunter's rule, by the use of which a given line can be divided into equal parts, third and fourth proportionals found, or a line increased in any proportion desired.

LINE OF METAL. That line drawn from the upper point in the base-ring to the upper point

of the muzzle which lies in the perpendicular plane of the axis of the bore.

LINE OF METAL ELEVATION. The elevation of a gun when the line of metal is horizontal; caused by the dispart of the gun.

LINE OF NODES. The line which passes through the nodes of an orbit.

LINE OF SIGHT. The right line which passes through the points of sight of a fire-arm.

LINE OF VESSELS. Vessels owned by the same company or person, and plying regularly between certain ports.

LINER. A ship of the line. One of a line of vessels.

LINING-CLOTHS. Canvas sewed in certain places upon the after side of a sail to protect it from chafe.

Line-officers. The combatants as distinguished from the non-combatants. See STAFF-OFFICERS.

Below is a list of the line-officers of the navy, showing the corresponding rank of officers of the army:

Admiral with General.
Vice-Admiral with Lieutenant-General.
Rear-Admiral with Major-General.
Commodore with Brigadier-General.
Captain with Colonel.
Commander with Lieutenant-Colonel.
Lieutenant-Commander with Major.
Lieutenant with Captain.
Master with First Lieutenant.
Ensign with Second Lieutenant.
Midshipman.
Cadet-Midshipman.

Mate, Boatswain, and Gunner, not in the line of promotion. For the duties of line-officers, see under proper heads.

See COMMANDER-IN-CHIEF, CHIEF-OF-STAFF, COMMANDING OFFICER, EXECUTIVE-OFFICER, NAVIGATOR, WATCH-OFFICER, OFFICER OF THE DECK.

Ling. A marine fish (*Lota molva*), something like the cod, but more slender, and having only two dorsal fins. It is largely used as food in Scotland and Ireland.

Linget. Small bullets or slugs cast in molds.

Lingo. A slang term for language.

Link. A single division of a chain. A rod or piece to transmit power from one part of a machine to another. Also, a Scottish term for a curve of a river.

LINK-MOTION. A system of mechanism composed of the eccentric-rods, link, link-block, valve-stem, etc., common in locomotives and marine engines, for reversing and stopping the engine, and can be used within narrow limits as a variable cut-off.

The principal kinds are the "*Stephenson shifting link-motion*," the "*Gooch stationary link-motion*," the "*Allan link-motion*," and the "*Walschaert link-motion.*"

LINK-WORMING. Formerly, when rope-cables were in use, the part of the cable near the anchor which would be liable to injury from a rocky bottom was protected by worming them with chains; hence called link-worming.

Linkister (*Eng.*). An interpreter.

Linstock. A short staff for holding a match-rope by which guns were formerly fired. Its lower end was shod with an iron point, which could be stuck into the deck when required.

Lintre. An ancient canoe.

Lip. An obsolete term for notch. To notch the edge of a sword. *Lips of a scarf*, the thin ends of the timbers which are scarfed.

Lipper (*Eng.*). See LEAPER.

Lira. An Italian coin of the value of $0.19.

Lisbon, the capital of the kingdom of Portugal, is situated on the right bank of the Tagus, near its mouth in the Atlantic Ocean, in lat. 38° 42′ 4″ N., lon. 9° 8′ 2″ W. The scientific institutions comprise the Royal Academy of Sciences, College of the Nobles, Royal Marine Academy, School of Navigation and Ship-building, Royal Academy of Artillery and Engineers, and Royal Military College. The harbor is one of the finest in the world; and the quays, which extend between 2 and 3 miles along the bank of the river, are elegant and commodious. The commerce is extensive. The exports consist of wine, oil, fruit, and salt, and the imports, hemp, flax, corn, iron, steel, hardware, etc. Pop. 254,000.

Lisbonine. The denomination of the moidore. A Portuguese coin of the value of $6.00.

L'Isle Adam, Philippe de. Forty-third grand master of St. John of Jerusalem, was born at Beauvais, 1464; died at Malta, 1534. He is renowned as the commander at Rhodes when that city was besieged, in 1522, by the Sultan Solyman the Great, with 200,000 Turks. The siege of the city is one of the most memorable in history. It reads like romance, and is too full of incident for even a sketch to be given in this place.

The grand master, with between 600 and 700 knights, and about 5000 men-at-arms, conducted the defense successfully for six months, the most heroic courage and devotion being shown by all, while the tremendous fire and obstinate perseverance of the Turks in their desperate assaults was quite as remarkable.

At last, after most terrific slaughter on both sides, and the death of most of the knights upon the battlements, an honorable capitulation was obtained, and the order retired from Rhodes, to wander about for the next eight years without a permanent seat.

In 1530 they obtained from Charles V. the cession of Malta and Gozo: and from that time the chevaliers of the order took the name of Knights of Malta. They had not long taken possession when L'Isle Adam died, his death being hastened, it is said, by grief at the dissensions which arose in the order.

His tomb, in the crypt of St. John, is one of the most interesting in that very curious church. —*E. Shippen.*

Lissom. Nimble; active.

List. Said of a vessel that leans to one side or the other; as, "The ship is listed to starboard," or, "She has 2° list to port."

Lister (*Eng.*). A spear for taking salmon.

Listing. A narrow strip cut from the edge of a plank.

Lithofracteur. An explosive mixture manufactured in Cologne, and used to considerable extent in Europe for mining purposes. Its composition is as follows:

Nitro-glycerine,	52	per cent.
Kieselguhr,	30	"
Coal,	12	"
Soda saltpetre,	4	"
Sulphur,	2	"

Litter. A temporary bed upon which a wounded person is carried.

Littoral (Fr. *littoral*, sea-coast). The sea-coast. The space between high- and low-water marks. Pertaining to, or growing on, the shore.

LITTORALA. A coaster of ancient times.

Live. To withstand a tempest without foundering; as, "The boat cannot *live* in such a sea."

Lively. Said of a vessel that is quick in her motions.

Live-oak. A species of timber used in ship-building, valued for its density and durability.

Liverpool, in Lancaster County, England, on the east bank of the Mersey estuary, 4 miles from the Irish Sea, in lat. 53° 24′ 3″ N., lon. 3° 4′ 17″ W., is one of the largest seaports in the world. Along the shore a line of docks and basins extends over 5 miles in length, having an aggregate water area of 300 acres and a quay space of 20 miles, reclaimed from the river. Some of the docks are connected with the Leeds and Liverpool Canal, and most of the others have half-tide locks and wet-basins. The London and Northwestern, Lancashire and Yorkshire, Great Northern, Manchester, Sheffield and Lincolnshire and Midland Railways have extensive stations close to the docks, and the Great Western Railway has access to Birkenhead, on the opposite side of the river, with which there is constant communication by steam-ferries. The town has extensive and varied manufactures, and shipbuilding is carried on to a great extent, but it owes its chief importance to its being a great seat of foreign export and import trade. The Mersey, at high-water, may be entered by the largest ships. Regular lines of the finest steam-packets in the world ply between Liverpool and Glasgow, Dublin, Cork, Bristol, and the principal ports of France, the Mediterranean, America, India, Australia, China, and Africa. Pop. 520,000.

Live-shell. A loaded shell.

Live-steam. Steam direct from the boiler at full pressure; in contradistinction to dead-steam, exhaust-steam.

Livid Sky. The dark leaden color of the clouds which precede a storm.

Livingston, John W., Rear-Admiral U.S.N. Born in New York. Appointed from New York, March 4, 1823. Midshipman in sloop-of-war "Ontario" and frigate "Delaware" in the Mediterranean, and in frigate "Constitution," at close of "piratical war" in the West Indies.

Commissioned as lieutenant, June 21, 1832, and served as a watch-officer in brig "Dolphin" and sloop "Fairchild" in the Pacific, and in frigate "Columbia" on a voyage around the world, visiting Sumatra, and destroying the piratical establishments on that island, and as executive-officer (a portion of the time in command) in the frigate "Congress" on the coast of California and Mexico during the entire Mexican war; was present at the capture of Guaymas and San Blas, and in the various operations in California.

Commissioned as commander, May 24, 1855; commanding sloop-of-war "St. Louis" on coast of Africa, 1856–58; commanding steamer "Penguin," Blockading Squadron, 1861–64; while off Wilmington, N. C., chased and destroyed a blockade-runner; commanding steamer "Bienville," Blockading Squadron, 1861; commanding frigate "Cumberland," James River Blockade, in early part of 1862.

Commissioned as commodore, July 16, 1862. After the evacuation of Norfolk by the rebels, Commodore Livingston was ordered there in command of navy-yard, with directions to restore the dry-dock, so it might be available for the repair of our Southern cruisers. In 1864, he was detached from the Norfolk Yard, and in 1865 ordered to the command of the Naval Station at Mound City, Ill., and the remaining vessels of the Mississippi Squadron. In 1866 he was detached from this duty and ordered to special service.

Commissioned as rear-admiral, May 26, 1868. Retired May 22, 1866.

Lizard. A piece of rope with a thimble spliced into one or both ends, used in different parts of a vessel as a leader for ropes. The *bunt-line-lizard* hooks to the topsail-tye near the yard and serves as a leader for the topsail buntlines, which are rove through the thimbles at the ends. A lizard is used on a light yard for stopping the yard-rope out on the quarter of the yard previous to sending it down from aloft.

Lloyd's (*Eng.*). A society of underwriters established in London since 1601, by whom the classes and rates of vessels are established and registered, and the principal business of British marine insurance carried on.

LLOYD'S AGENT (*Eng.*). A person employed in any port for attending to the interests of the board of underwriters called Lloyd's, to send commercial information, assist vessels, etc.

LLOYD'S LIST (*Eng.*). A journal devoted to commercial interests, published daily.

LLOYD'S REGISTER (*Eng.*). The annual publication of the list and register of British and foreign shipping.

LLOYD'S SURVEYOR (*Eng.*). One who surveys or examines the condition of vessels for the underwriters.

Loach. A small fish allied to the minnow, of the genus *Cobitis* (*C. barbatula*), inhabiting small, clear streams, and esteemed dainty food (written also *loche*).

Load. To insert the charge and projectile in a fire-arm. To take cargo on board.

LOADED SHELL. A shell filled with powder and fused.

LOADING, DENSITY OF. The proportion between the cubical contents of the powder-chamber and the space occupied by the powder.

LOADING-TRAY. A metallic shelf by which the shell of a breech-loading cannon is placed in the bore.

LOAD WATER-LINE. The line of immersion when a vessel is loaded.

LOAD WATER-SECTION. The horizontal section of a vessel at the load water-line.

Loadsman. An obsolete term for a pilot.

Loadstar, or Lodestar. The pole-star. Any guiding star.

Loadstone, or Lodestone. A natural magnet.

Loam. A mixture of sand and clay used in molding.

Loath to Depart. The name or commencement of a popular song which is frequently mentioned in the annals of the English navy during the 17th century. The air was played upon the trumpets at the departure from a vessel of a distinguished visitor, and also previous to sailing, as a signal for the ship to be cleared of visitors.

Lob. Stupid; slow. Hence, *looby* or *lubber*

Lobby (*Eng.*). The name sometimes given to the passage-way in the forward part of the cabin.

Lob-cock. A contemptuous term for a sluggish, lazy person.

Lobipedidæ. A family of birds of the order *Grallæ*, having toes separately margined with a scalloped membrane. They frequent salt as well as fresh water, and are sometimes seen far at sea on patches of sea-weed.

Loblolly. A former name for gruel or porridge.

LOBLOLLY-BOY. The sick-bay attendant. Now called *bay-man* or *nurse.*

Lobscouse, or Lops-course. A stew composed of vegetables, meat, and hard bread.

Lobster-boat. A boat used by lobstermen, fitted with a tank, in which the lobsters are kept alive.

Lobster-toad. A kind of crab.

Lob-tail. The sperm whale is said to be lobtailing when it beats the water with its tail.

Lob-worm, or Lug-worm. The *Arenicola piscatorum.* It is highly esteemed for bait on the coasts of Europe.

Local Attraction. The force exerted upon the needle of the compass by the iron in the vicinity.

Local Deviation. The deviation or error in a ship's compass caused by the iron in the vessel's construction, her guns, etc.

Local Time. See TIME.

Loch. A Scotch or Irish lake or arm of the sea.

Lock. That part of a small-arm or great gun by which fire is communicated to the charge. An inclosure in a canal for the purpose of raising or lowering vessels from one level to another. To entangle the lower yards of a short ship while tacking.

LOCKAGE. Charges for passing a vessel through a lock.

LOCK-FAST. An attachment to the lock of a breech-loading fire-arm.

LOCKING-IN. The position of the clews and bodies of the alternate hammocks when hanging on the hooks.

LOCK-LUG. The mass or raised portion on the surface of a gun to which the lock is attached.

LOCK-NUT. A supplementary nut, screwed down on a primary one to prevent the latter from turning, or slacking up.

LOCK, STOCK, AND BARREL. The whole of anything.

LOCK-UP SAFETY-VALVE. A safety-valve which, with its weight, is so inclosed in a box and locked up that it cannot be tampered with. A rod extending up through the box enables the engineer to blow off, and it can be inspected at any time by the proper person having the key.

Locker. A small closet where articles may be locked up, or a compartment in a vessel used for the stowage of certain articles; as, a *shot-locker*, where solid shot are kept; the *chain-locker*, where the chain-cables are stowed. *Davy Jones's locker* is the bottom of the sea.

Locket. The metallic case at the end of a sword scabbard.

Loc-man, or Loco-man (*Eng.*). A former name for a pilot.

Locomotive-power, or Motive-power. The power by which a change of place is produced, as the sails acted upon by the wind, or steam.

Lodemanship, or Lode-manege. An ancient name for seamanship and pilotage. Also written *lode-merege.*

Lode-ship (*Eng.*). An old name for a pilot-boat. See LODEMANSHIP.

Lodesman. The Anglo-Saxon name for pilot.

Lodestar. See LOADSTAR.

Lodestone. See LOADSTONE.

Lodging-knee. See KNEE.

Lodia. A trading-boat of the White Sea.

Lofty Ship. An expression formerly applied to a square-rigged vessel.

Log. The apparatus used for obtaining the approximate rate of speed of a vessel through the water. It is first mentioned in the early part of the 16th century by Pigafetta, the companion of the celebrated navigator Magalhaens, who speaks of the log (*la catena a popa*) as a well-known means of measuring the course passed over. Purchas makes mention of it in 1607; but the length of a meridian not being then determined, its divisions were necessarily inaccurate. They were corrected in 1635 by Norwood.

The apparatus consists of the *log-chip*, *log-line*, *reel*, and 28 and 14 seconds *time-glasses.*

The log-chip is a flat piece of thin board in the form of a quadrant of a circle, of about 6 inches radius, loaded on the circular edge with lead, sufficient to make it float vertically. At the corners small holes are bored, and through the two near the extremities of the loaded arc are run the ends of a piece of small line about 4 feet long; these ends have a knot made in them so as to prevent their being drawn through when a strain is brought against the chip by the water. To the middle of this line is fastened a wooden plug, called a toggle.

The log-line is a small stout line, about 150 fathoms long, the end of which is taken through the remaining hole in the chip and knotted; at the same distance along the line, as the length of small cord from the face of the chip to the toggle, is fastened a piece of wood with a hole or socket into which the toggle fits. The whole is so arranged that when the toggle is in the socket the chip will hang in a three-legged span, and its surface be perpendicular to the log-line when straightened out, trailing in the water astern of a vessel. The toggle fits closely enough into the socket to require a sharp, quick pull on the line to free it, when the chip will trail point toward the ship, and can be easily hauled on board. The other end of the log-line is made fast to a reel about 2 feet long, which should turn with as little friction as possible, and is then wound up on it. The log-line is divided into distances, called *knots*, and these are subdivided into fifths, so that each subdivision will represent two-tenths of a knot. These divisions are all marked. The length of a knot is made the same part of a sea mile (6086.4 feet) that 28 seconds is of an hour, which gives for its length 47.4 feet.

To mark the log-line.—It should be first well soaked in water and stretched lightly, so as to take the kinks out, then measure off about 20 fathoms from the chip, and place a piece of white rag; this part is called the *stray-line*, and should be long enough to let the chip float well clear of the eddies, etc., astern of the vessel before the

marking of the knots commences; measure from the white rag the length of the first knot, and mark it by twisting into the line at that point a small piece of cord with one knot made in the end. Measure off the length of the next knot from this mark and mark it, with a piece of cord with two knots in the end, mark the next with three knots, and so on until all the line is marked. Then subdivide each knot into five equal parts, marking them with small pieces of fish-line, with no knots.

It is well on board ship to mark off on the deck the proper lengths of a knot and the subdivisions, and drive in copper tacks at these places. It will aid in marking a log-line, and will also be of use for future reference, as log-lines should be often examined and remarked. The stretch and shrinkage of the line varies very much under all circumstances.

The 28 and 14 seconds time-glasses consist each of two glass bulbs, joined by a small neck, placed in a metal or wooden frame for protection. One of the bulbs has an opening in the end through which is placed a quantity of clean, dry sand, the opening closed and covered, so as to keep out moisture, before the glasses are placed in their frames.

The quantity of sand in each glass should be such that it will take exactly 28 seconds of time in one and 14 seconds in the other to run through the neck into the lower bulb when the glass is held in a vertical position. These time-glasses need constant attention, and care should be taken to keep them dry, as moisture causes the sand to run more slowly, which would give incorrect results. They may be tested by means of a chronometer or watch, or a pendulum beating seconds, and be corrected if they are in error by adding or taking out a proper quantity of sand, or their error may be allowed for when known.

Logging the ship, or *heaving the log*, is the finding the speed of the vessel by means of the apparatus just described, and is performed thus: one or two men hold the reel, on the lee-side of a sailing vessel's stern or in a convenient place near the stern of a steamer, so that the line will have a clear run, another the time-glass, and the quartermaster, or a junior officer of the watch, adjusts the chip by putting the toggle into its socket on the log-line, so that it will not pull out too easily, then takes the chip and a small coil of line in his hand, and sees all clear. When he is ready he calls out to the glass-holder, "*Clear glass!*" to which the glass-holder, when the sand is all in one bulb, and he is ready, replies, "*All clear!*" The quartermaster then calls out, "*Look out!*" and throws the chip over the lee-quarter, so that it will float out clear, and take the line out straight in the wake of the vessel, and assists the line off the reel easily by small pulls, so as to overcome friction; as the white rag marking the stray-line passes the taffrail he cries out, "*Turn!*" which the glass-holder repeats, at the same time turning the glass so that the bulb with the sand in is uppermost, and the sand runs into the lower bulb, watching it closely. The instant the glass-holder sees the sand all out of the upper bulb he calls, "*Out!*" when the quartermaster grasps the line, checking it, and noting the last mark run out, or on the line at the taffrail; if there is no mark at the taffrail the nearest is noted, and the speed estimated from it. It is of no possible use though to try to estimate closer than one-tenth of a knot. A sharp pull on the log-line will easily free the chip, when the line is hauled on board and reeled up for the next heave. If, in the above case, the 28-second time-glass was used and, upon hauling in the line, three fish-line marks and then the 8-knot mark came in, the vessel's speed would be $8\frac{3}{5}$, or 8.6 knots. If using the 14-second time-glass, the speed shown by the line must be doubled to get the actual speed, and in the above case would be 17.2 knots. On board ship it is not customary to ask "How fast is she going?" but, "How much is she logging?" The answer in this case would be, "She is logging 8.6, or 17.2 knots." The 14-second time-glass is used when the speed of the vessel is above 6 knots, for the reason that the reel cannot be well handled with above about 10 knots line on it; it would be too heavy and bulky and take too long to heave, and also the line would be liable to break from its own weight in the water if more was used. It is customary, on board men-of-war under way, to heave the log at the end of every hour and note the vessel's speed, so as to calculate her run by the rules of navigation.

This method of determining a vessel's speed is at best but an approximation, requiring great care and skill to obtain any reliable result. A following sea will send the chip home and not give enough speed. A head sea will give too much. One person will give out the line to the chip too fast, another will not give it enough. In a sailing-vessel the wind may be squally, or increasing and decreasing, so that the speed will not by any means be the same through the hour. In such cases the log may be hove more frequently, and an average taken of the results as the speed for the hour.

A number of apparatus have been invented of late years for the same purpose, called patent logs, and taking their names from the inventors, one class of which are Massey's, Trobridge's, Reynolds's, Walkes's, etc. All of these are so nearly alike in principle and construction, that a description in general will suffice for all. They consist of an elongated metal box containing a system of cog-wheels connected with the hands of three dials showing on the outside. To the rear of the box is attached a hollow cylinder, on which is a small four-bladed propeller, whose spindle or shaft passes through this cylinder and connects with the cog-wheel work. The pitch of this propeller is known, and consequently the number of revolutions it will make in a mile, and the cog-wheel work simply registers these revolutions in distances passed over on the dials, one of which has the circumference representing 1 mile divided into tenths, the next the circumference representing 10 miles divided into tenths, each division representing 1 mile, and the last the circumference representing 300 miles divided into thirtieths, each division representing 10 miles, so that they will give readings from one-tenth of a mile up to 300 miles.

These logs are towed astern of the vessel at the end of a line from 35 to 60 fathoms long, so as to keep them clear of eddies and not allow them to be pulled out of the water by the vessel's pitching in a seaway, and have a swivel in the forward end to fasten the line to, so that it will not

twist up. From their shape they are sometimes called by sailors *harpoon-logs*.

When these logs are used the hands of all the dials are set at 0, the log then made fast to the towing-line and thrown overboard astern, and it is evident that the propeller will move faster or slower, corresponding to the speed of the vessel. This motion is communicated to the cog-wheels, and by them to the hands of the dials, by which means the distance run through the water in any given time is pointed out on the dials. The log is hauled in and the reading noted whenever the course is changed, and is also hauled in, read, and reset every 24 hours, generally at noon, to which time all the calculations of navigation are reduced on board vessels of the navy.

Under three knots the indications of these logs are not very accurate. They are liable to be stopped by sea-weed or anything floating astern, must be hauled in when the vessel stops or goes astern, and are liable to foul a steamer's propeller.

When the vessel is going slowly in shoal water and on rocky bottom they should be hauled in, as they are liable to catch on the bottom and be torn off. Sharks often bite them off. It must be recollected also that they do not give the distance the vessel has made good over the ground, unless she is running in no current. If she runs against the current, they will indicate the distance the vessel has made over the ground plus the distance the current makes over the ground in the same time, and in case of cross currents and stern currents, their indications would be a resultant of the speed of the vessel and the current.

Taffrail patent log.—In this log the principle is precisely the same as in the preceding ones, only the registering cog-wheel work, with its dials, is screwed upon a convenient place on the taffrail, and the propeller towed overboard from it by means of a long line, through which it communicates its motion to the register. The only way in which it is superior to those mentioned before is in its convenience to be read, doing away with the hauling in of the line each time, and only the propeller part is liable to be lost. The towing-line is liable to become full of kinks from the twisting motion. The register of this log has in cases been connected electrically to a self-registering apparatus in the cabin of the vessel, so that the distance run during the voyage could at any time be read off. A small bell was attached to the register, which would ring automatically at every mile passed. This is said to work well, but its expense has as yet prevented its general adoption.

The Clark-Russell, or *spring-log*, consists of a spring something like a grocer's spring-scale for weight, screwed upon the taffrail, to which a line and chip are attached. The pressures exerted upon a certain surface when it is towed through the water at different rates of speed are determined by experiment, and these different pressures in pounds form the scale to which the log is graduated. The chip is like the ordinary log-chip, and is towed from a line attached to a hook at the end of the spring by a loop, and whenever it is wished to ascertain the speed of the vessel the line is looped to the hook and the chip thrown overboard; the speed is then read off from the scale of the spring. The chip may be kept towing all the time, so that the speed of the vessel can be known at any instant; but this is not advisable, as it would in a short time weaken the spring, causing it to give incorrect results. Also, from constant use, the spring of this log loses its elasticity, yet it is considered very reliable. It, of course, does not give the distance run, but only the speed at the time it is used.

Current-log.—The log is often used to determine the direction and velocity of currents, and is then called a current-log. It is hove from a boat or ship at anchor, in the same manner as described for heaving it to determine a vessel's speed. The result given will be the number of knots and tenths the current runs per hour, and by taking the bearing of the chip by a compass the direction of the current is ascertained. In strong currents patent logs may be used.

Ground-log.—When surveying in shoal water and in currents, the actual run of the vessel over the ground is often wanted; to find this the log-line is made fast to a lead or small grapnel, which will hold it fast to the ground, and the speed is measured in a similar way to that before described, with the aid of the 28- or 14-second time-glass.—*J. E. Noël, Lieutenant-Commander U.S.N.*

Log or Log-book. The book which contains the official records of all transactions on board of a vessel, of voyages from port to port, and of meteorological observations made. The log-book of a ship of war contains in its columns the courses steered, distance sailed, and the leeway made for each hour at sea; the direction and force of the wind, state of weather, height of barometer, temperature of air and surface water, and a description of the clouds, whether in port or at sea, are also noted; the position of the ship at noon, by observation and dead-reckoning, the distance run and course made good, and the current by which the ship has been influenced are entered in their appropriate places. Under the head of "remarks" are entered an account of all official transactions, evolutions, drills, courts-martial, boards of inspection, signals with other vessels, punishments and offenses, ratings and disratings, names of all persons discharged, transferred, or received on board, accidents, such as grounding or collisions, and an account of all operations against the enemy, with the injuries sustained. All information of value to navigators, errors of charts, or peculiar appearances of the water are recorded. The log-book is signed by each watch-officer, who is responsible for the record kept during his own watch. It is examined daily by the navigator, who certifies as to its correctness, and is presented by him each day to the commanding officer for his approval. A copy of the log-book is sent every six months to the Bureau of Navigation at Washington.

Logged. Recorded in the log-book.

Log-glass. A time-glass measuring an interval of 14 or 28 seconds, used in connection with the log-line in ascertaining the speed of a vessel. See Log.

Log-line. See Log.

Log-slate. A double slate, the inner sides of which are marked in a similar manner to the two pages of the log-book, upon which each day's events are noted. The record upon the log-slate is copied daily into the log-book.

Logarithm. The exponent of the power to

which a given number, called a base, must be raised to produce a certain number. The logarithm of N is the value of x, which satisfies the equation of $a^x = N$, where a is the base. Since any positive number except unity may be taken as a base, there may be an infinite number of systems; but there are only two in use, viz., the Naperian, so named from Napier, a Scottish baron, who invented logarithms, and constructed the system in which the base is 2.71828, and the common system constructed by Henry Briggs, the base of which is 10. Every logarithm consists of an integer, or of an integer and a decimal number, the former being called the *characteristic* and the latter the *mantissa;* and of two factors, one depending on the base, and constant, and called the *modulus*, and the other upon the number, changing as the number changes. The Naperian logarithms are sometimes called *natural* logarithms, from the modulus of the system being unity; and sometimes *hyperbolic* logarithms, from their relation to certain areas included between the equilateral hyberbola and its assymptotes.

LOGARITHM, LOGISTIC. The logarithm of 3600 (number of seconds in an hour), diminished by the logarithm of the number of seconds in any period less than an hour, is called the *logistic* logarithm for that period. It is useful for interpolating for the moon's right ascension and declination.

LOGARITHMIC CURVE. A curve in which the subtangent is the same at every point.

LOGARITHMIC SPIRAL. A curve of which the tangent always makes the same angle with the radius rector.

Log-canoe. A canoe made from a single log.

Loggerhead. A small upright piece of timber in the stern of a whale-boat, over which a turn of the line is taken when it is running out too fast. An iron instrument used for heating tar. A species of turtle.

Logwood. The heart-wood of the *Hæmatoxylon Campeachianum*, a tree found in the tropical parts of the American continent. It is used as a dye.

Loich. An old English statute term, in which were included the cod-fish, ling, and lobbe.

Lomp. A kind of roundish fish.

Londage (*Eng.*). An obsolete term for landing from a boat.

London. The seat of government of the British empire and capital of England, is principally situated on the north bank of the Thames, in lat. (St. Paul's) 50° 30′ 49″ N., lon. 0° 5′ 48″ W. The area of the city is nearly 118 square miles; population 3,900,000, and it is the largest and richest city in the world. The docks of London have a river frontage of 4 miles, and an area of 566 acres. The two West India Docks cover 295 acres, one East India Dock 32 acres, South Dock 33, and St. Katharine's Docks 24 acres. The Thames is tidal up to Woolwich for ships of any burden. The tide ascends about 15 miles above London Bridge. The port extends to Gravesend, 30 miles down the river, and from Limehouse to London Bridge there is a continuous line of mercantile shipping. All kinds of manufactures are pursued here, the principal being those of silk, beer, spirits, type-founding, chemicals, engineering, and ship-building.

Londonderry, Ireland, is situated on the Foyle, 5 miles above Lough Foyle. The manufactories are mills for spinning flax, flour-mills, roperies, foundries, and ship-building yards. The principal exports are linen and linen yarn, eggs, butter, wheat, oats, and oatmeal, amounting annually to over $5,000,000. Regular communication by steamers is maintained with Liverpool, Glasgow, Greenock, and other ports. Ocean steamers call at Moville, on Lough Foyle, 18 miles below the town. Pop. 26,000.

London Wagon (*Eng.*). The name formerly given to the vessel by which impressed men were taken from London to the receiving-ship at the Nore.

Longa. A Roman row-boat of large capacity.

Long Ball. An old term for an engagement between vessels at long range.

Long Board. A long distance sailed upon one tack.

Long-boat. The largest boat which was formerly carried by merchant vessels. It was furnished with masts, sails, and oars, and was principally used in transporting stores, etc. In preparing for sea it was hoisted in and stowed on deck. It corresponds to the launch of a ship of war.

Long D-valve. An old English slide-valve, the cross-section of which resembled the letter D, having length sufficient to operate both steam-ports.

Longer (*Eng.*). Each row of casks placed in the hold athwartships.

Long Gasket. A sea-gasket or rope used at sea for securing a sail to its yard.

Longie (*Eng.*). The *Uria troile*, a sea-bird found on the northern coasts of America and Europe.

Longitude. The longitude of any point on the earth's surface may be defined as the angle at the pole contained between two meridians, one of which passes through the place in question, and the other through some conventional point regarded as the origin from which the longitudes are reckoned. From the first or prime meridian longitudes are reckoned east and west from 0° to 180° in arc, and from 0^h to 12^h in time.

The parallels of latitude being marked out by the paths followed by the stars in their apparent daily motion, the latitude of a point may always be determined by direct observation of the heavenly bodies, but in the case of longitude the element of time as measured by the daily revolution of the earth on its axis comes in, and the question resolves itself into the comparison of the local time with the time at the prime meridian.

Before the invention of the electric telegraph the transportation of chronometers regulated to the time of the prime meridian, and the motion of the moon, afforded the principal methods of measuring longitudes. By the first method most of the prominent points on the earth's surface have had their longitudes determined, but although great accuracy has been attained in the manufacture, chronometers are still subject to irregularities from changes of temperature and from induced magnetism of the steel parts, amounting to a considerable degree of error in long voyages.

The measurement of longitude by means of the moon's motion, although theoretically accu-

rate, is not so in practice for many reasons, among the principal of which is that the moon's apparent motion among the stars being only about one-thirtieth as rapid as that of the earth on its axis, any error of observation is multiplied in the resulting longitude by a factor nearly equal to thirty. As the inaccuracy of chronometric measurements increases with the distance between the points whose difference of longitude is to be established, geographers have urged the exact and permanent establishment of as many secondary meridians as practicable, situated at convenient distances around the earth, from which measurements could be quickly and accurately made to subsidiary points by chronometers. The very general connection of all important points by either land telegraph-lines or by submarine telegraph-cables at the present day, affords admirable facilities for the most simple and accurate method of determining longitudes, which is, in short, the comparison of the local times of two places by means of electrical signals.

The principle of this method, which in its present perfected state is due to American astronomers, is extremely simple. At each of the two places whose difference of time, and consequently of longitude, is to be determined a transit instrument, clock, and chronograph is established,—the chronograph being for the purpose of marking the exact time of any occurrence, such as the passage of a star over the wires of a telescope or the arrival of a time-signal. All preliminary arrangements being made, the error of each clock on the time of its place is determined by meridian transits of stars, and the clocks are compared the same evening by signals sent each way over the wire or telegraph-cable, thus, by comparison of the local times, determining the difference of longitude between the two places. The time occupied by a signal in traversing the wire or cable is quite appreciable, but is eliminated by sending an equal number of signals each way. The U. S. Hydrographic Office is now engaged in determining in this way as many secondary meridians as practicable all over the world. Although most maritime nations refer their longitudes to the meridian of Greenwich, the French still use that of Paris, which is 2° 20′ 14.5″ east of Greenwich, and the Spaniards that of Cadiz, which is 6° 12′ 20″ west of Greenwich. Although on some maps American geographers still show the meridian of Washington, it is practically used only as a secondary meridian, the Naval Observatory being 77° 3′ 5.8″ west of Greenwich, and all the longitudes of the United States being measured from it, or from the observatory at Cambridge, Mass., in longitude 71° 7′ 42.7″.—*F. M. Green, Lieutenant-Commander U.S.N.*

LONGITUDE BY ACCOUNT. The longitude deduced from the course and distance made from the last position determined by observation.

LONGITUDE BY CHRONOMETER. The longitude deduced by applying the hour-angle of a heavenly body, corrected for equation of time (or the mean time at the place of observation) to the mean time at a first meridian, which is shown by the chronometer. See LONGITUDE.

LONGITUDE BY A LUNAR OBSERVATION. A method of obtaining the longitude of a place at sea by measuring the angular distance of the moon from the sun, a planet, or fixed star. This method has gradually fallen into disuse since the great improvements that have been made in chronometers, as the liability to error is greater in a lunar observation than in other methods.

LONGITUDE IN ARC, and LONGITUDE IN TIME. The earth rotates uniformly on her axis once in 24 hours, and thus every spot on her surface describes a complete circle, or 360°, in that space of time. Hence the longitude of any place is proportional to the time the earth takes to revolve through the angle between the first meridian and the meridian of the place, and thus the longitude of a place may be expressed either in *arc* or in *time*. In reckoning by arc each degree is divided into 60 minutes, and each minute into 60 seconds. In reckoning by time, each hour is also divided into 60 minutes, and each minute into 60 seconds. But a distinct notation for each of these has been adopted, degrees, minutes, and seconds being represented by ° ′ ″, and hours, minutes, and seconds by ^{h} ^{m} ^{s}; and care should be observed not to use the same marks for both, great confusion arising from so doing. Longitude in arc and longitude in time are easily convertible, for since 360° is equivalent to 24^{h}, 15° is equivalent to 1^{h}, 1° to 4^{m}, and 1′ to 4^{s}.

LONGITUDE (CELESTIAL), CIRCLES OF. Great circles of the celestial sphere passing through the poles of the ecliptic, and so called because they severally mark out all points which have the same longitude.

LONGITUDE (TERRESTRIAL), CIRCLES OF. Great circles of the terrestrial sphere passing through the poles of the equator, and so called because they severally mark out all places which have the same longitude. They are also and generally called *meridians*, because for every place on the same circle it is noon simultaneously.

LONGITUDE OF A HEAVENLY BODY. The arc of the ecliptic intercepted between the first point of Aries and the secondary circle to the ecliptic, which passes through the place of the body. Or, which is the same thing, the angle at the pole of the ecliptic between the circle of longitude passing through the first point of Aries and that passing the place of the body. Longitude is reckoned from the first point of Aries eastwardly from 0 to 360°.

LONGITUDE, HELIOCENTRIC AND GEOCENTRIC. See LATITUDE.

Long-jawed. Said of a rope that has been used and strained until its lay has been lengthened.

Long-legged. Applied to a vessel of comparatively great length. Also to a vessel of great draft of water.

Long Oyster (*Eng.*). The cray-fish.

Long-service. Formerly said of a cable, served to protect it from chafe.

'Longshore-man. A dock-laborer or stevedore's man. Sometimes used by sailors as a term of contempt.

Long-shot. A shot at long range. The term is also used to express the error of another's statement.

Long Stroke. An order to a boat's crew to row with a greater length of stroke, and more outlay of strength.

Long-tackle. The name sometimes given to a top-burton, or the tackle by which a topsail is hoisted to the yard previous to bending.

Long Togs. Clothes worn by civilians.

Long Tom. A gun formerly used as a bow-chaser, which was of great length and range compared with the guns then in general use.

Long Voyage. One during which the ocean is crossed, as distinguished from a coasting voyage. Also called a *deep-water voyage.*

Long-winded Whistler. A long-range gun used as a chaser.

Loof, or Luff of the Bow. That part of the bow of a vessel where the planks begin to curve towards the stem.

Look-out. To watch. A person stationed to watch for land or vessels. A look-out is always stationed aloft, usually on the fore-topsail yard, from sunrise to sunset, and others, also, if the vessel is in the vicinity of dangers where extreme vigilance is required. From sunset to sunrise the look-out men are stationed, one on each bow and one at each gangway, and both by day and by night a man is stationed over the life-buoy at the stern.

Look Out for Squalls. Precautionary advice not confined to the weather.

Look Up. A vessel *looks up* towards her course as the changing of the wind allows her to sail nearer to that direction.

Loom. To appear enlarged, as a vessel or land seen indistinctly through fog. That part of an oar which, in rowing, is inside of the row-locks. A *loom-gale* is a moderate gale. The *loom of the land* is the darker appearance above the horizon (sometimes seen and often imagined), which indicates the proximity of land before it can be seen.

Loon. The bird *Colymbus glacialis*, or the "Great Northern Diver."

Loop. The bight of a small rope. The narrow part on the under side of a howitzer by which it is secured to its carriage. A *loop-bolt* is the bolt which passes through the loop of the howitzer and the lugs on the carriage to secure the piece in position. The *trail-wheel loop* is the aperture in the trail of a field-carriage into which the wheel enters, and the *loop-pin* holds the wheel in place.

Loose. To unfurl a sail; to let go a rope.

LOOSER. A man whose duty it is to loose a sail.

LOOSE FOR SEA. To get under way.

Loose Fall. A whaleman's expression for the loss of a good opportunity to strike a whale.

Loose Ice. Broken ice.

Loot. To plunder, and the proceeds thereof.

Loovered Batten. One of the sloping pieces of which blinds or open partitions are formed, by which air is admitted and rain excluded.

Lop-sided. Having one side larger than another. See LAP-SIDED.

Lorcha. A Chinese coasting-vessel, the hull being similar to vessels of European construction, while the rig is Chinese.

Lord Warden of the Cinque Ports (*Eng.*). The officer by whom the five ports of Hastings, Romney, Hythe, Dover, and Sandwick, and the additional ports of Winchelsea and Rye, are governed.

Lorient. A fortified seaport at the mouth of the Scorf, in the Bay of Biscay, department of Morbihan, France. The harbor is capacious, safe, and commodious, and lined by handsome quays. At some distance below the harbor its entrance is commanded by a fort on the Isle St. Michael, mounting 500 guns. The dock-yard and arsenal are among the most complete in France. The principal building is the Prefecture Maritime, situated at the entrance of the dock-yard. The city has also forges, foundries, and manufactures of steam-engines. Pop. 31,500.

Lorn (*Scotch*). The crested cormorant.

Lorrell (*Eng.*). A old term for a slow, lazy fellow.

Lose Ground. To fall to leeward.

Lose the Number of One's Mess. A common expression for dying.

Lose Way. To stop; said of a vessel when she loses her headway through the water.

Loss. A term in insurance denoting the damage to the insured subject by the perils insured against, in accordance with the terms of the contract. No loss can be within the meaning of the contract or policy except it be the direct result of one of the perils mentioned.

Lost. Said of a sunken or wrecked vessel.

Lost Day. The day that is lost in crossing the 180th degree of longitude from east to west. See DAY, CIRCUMNAVIGATOR'S.

Lost-motion. The motion due to loose journals and bad-fitting gear.

Lost or not Lost (*Eng.*). A legal clause inserted in marine insurance policies.

Lot. A contraction of "allotment."

Lotman. An old name for a pirate.

Lound (*Eng.*). Formerly signifying calm.

'Low and Aloft. An expression used when all sail is set.

Lowe (*Scotch*). A flame. The name applied to the torch used by fishermen at night.

Lower. A term characteristic of the principal division of a mast and the yard, rigging, etc., belonging to it. To ease away a tackle or any rope to which a weight is attached. To become cloudy.

LOWER-DECKER. One of the guns on a lower deck of a frigate or ship of the line.

LOWER HANDSOMELY. To lower away slowly.

LOWER-HOLD. The space under the lower deck in a merchant vessel having two decks.

LOWER-HOLD BEAM. A beam of the lower deck.

LOWER-HOPE (*Eng.*). One of the reaches in the river Thames.

LOWER LIFT. A lift belonging to the fore, main, or cross-jack yard.

LOWER-MAST. See MAST.

LOWER TRANSIT. The passage of a heavenly body across that part of a meridian which is below the horizon, or 180° from the upper transit.

Low Latitude. A latitude near the equator.

Low-pressure Engine. The terms *low* and *high pressure* were formerly synonymous with *condensing* and *non-condensing*, but at present a low-pressure engine is usually considered to be one the working pressure of which does not exceed 45 or 50 pounds per square inch.

Low Sail. A course or close-reefed topsail.

Low-water. Low-tide.

Low-water Alarm. A device arranged to blow a whistle when the water in a steam-boiler falls below a certain level.

Low-water Indicator. An attachment on a steam-boiler to indicate the water-level within.

Lowry, Reigart B., Commodore U.S.N. Born in South America, July 14, 1826. Appointed from Pennsylvania, January 21, 1840;

attached to sloop "Boston," East India Squadron, 1840–43; steamer "Princeton," special service, 1844–45; Naval School, 1846.

Promoted to passed midshipman, July 11, 1846; Home Squadron during Mexican war; present at Tampico, Tuspan, Vera Cruz, Tabasco, Seven Palms, and Alvarado; wounded slightly at Tuspan; razee "Independence," Mediterranean Squadron, 1850–52; sloop "Plymouth," East India Squadron, 1852–54.

Promoted to master, 1855.

Commissioned as lieutenant, September 14, 1855; steam-frigate "Powhatan," East India Squadron, 1855–56; receiving-ship, New York, 1857–58; sloop "Preble," Brazil Squadron, 1858–59; special duty, 1860–61; steam-sloop "Pawnee," Atlantic coast, 1861; was present in "Pawnee" in first firing on Fort Sumter; engagement at Acquia Creek, Potomac River, 1861; commanded steamer "Freeborn" in engagement at Matthias Point and other affairs on Potomac River; commanded steamer "Underwriter," in Albemarle Sound, 1861; was executive-officer of steam-sloop "Brooklyn" in the battles with the forts below New Orleans, and at the capture of the city; first attack on Vicksburg, June 30, 1862; commanded steamer "Scioto," Western Gulf Blockading Squadron, 1862–63; engagement at Donaldsonville, La., between "Scioto" and rebel force of 900 men and 7 pieces of artillery, October 5, 1862; engagement with batteries at Galveston, January, 1863.

Commissioned as lieutenant-commander, July 16, 1862; special duty, Washington, 1863–64; commanding apprentice-ship "Sabine," 1864–68.

Commissioned as commander, July 25, 1866; commanding flag-ship North Atlantic Fleet, 1869–70.

Commissioned as captain, November 2, 1871; commanding steam-sloop "Canandaigua," North Atlantic Station, 1872–74; Naval Station, New London, Conn., 1875–77; waiting orders, 1878–80. Commissioned as commodore, April 1, 1880.

Loxodromic. Pertaining to a vessel's course when it makes an oblique angle with the meridian. A *loxodromic curve* is a line drawn on the surface of the sphere which cuts all of the meridians at the same angle; a *rhumb-line*.

Lozenge. An equilateral figure having two acute and two obtuse angles.

Lubber. A clumsy, awkward person, lacking seamanlike qualities.

LUBBER-LAND. An imaginary condition or place referred to by seamen as the state of future existence of lubbers.

LUBBER'S HOLE. The space between a top and the mast-head which affords a passage into the top for greenhorns, or persons who are unable to climb outside of the top-rim.

LUBBER'S POINT. The black vertical line on the inside of the compass-bowl which represents the vessel's head in steering.

Lubricant. The oil or other substance applied to the bearings of a machine to diminish friction.

Lubricator. An oil-cup or other contrivance for supplying lubricants to the working parts of machinery.

Lucida. The brightest star of a constellation.

Lucifer. Son of Jupiter and Aurora, made the morning star. See VENUS.

Lucky Minie's Line (*Eng.*). The name given to the stem of the sea-plant *Churda filum.*

Luff. To bring a vessel's head nearer the wind. A name given to the forward leech of a fore-and-aft sail. That part of a vessel's bow where the planks begin to bend towards the stem. Also a familiar term for lieutenant. *To keep the luff* is to steer a vessel close to the wind. *Luff and lie* is an old expression, meaning to luff and remain close to the wind. *Luff and touch her* is to luff until the sails shake or *touch* slightly. *Luff into a berth* is to luff into a position for anchoring, bringing the wind ahead. *To luff round* is to luff into the wind as in tacking, or for the purpose of deadening the vessel's headway. *To luff hard* is to luff so as to shake the sails. A *luff tackle* is any tackle with a double and single block, which may be used as required. *Rigging luffs*, however, which are used for setting up lower rigging and stays, may consist of two double blocks or two single blocks. A *luff upon luff* is the purchase consisting of one luff-tackle applied to the fall of another.

Luff of the Bow. The roundest part of the bow.

Lug. A short flange or projection used to fasten one object to another. See LOCK-LUG.

Lug-boat. A boat carrying lug-sails.

Lugger. The name applied to vessels with two or three masts upon which lug-sails are carried. They are peculiar to the French and English coasts. During the early part of the present century they were frequently used as privateers and smugglers, and some vessels of this class were as large as 300 tons.

Lug-sail. A quadrilateral sail used in luggers, and frequently in sail-boats. It is bent to a yard, which is hoisted upon the mast by the halliards, which are attached to it at a quarter of the distance from the forward end. The tack of the sail is secured near the heel of the mast, and in hoisting the yard a strain is brought upon the luff of the sail, by which the yard is kept in an oblique position. It is inconvenient in use on account of the necessity of shifting the yard to leeward of the mast in tacking.

Lull. An interval of less force of wind during a gale.

Lull-bag. A wide hose made of canvas which is used on whale-ships for leading the blubber into casks.

Lumber. Timber sawed and split, ready for use. Articles heaped together in disorder.

Lump. The name of a heavy lighter used in English dock-yards for transporting anchors, cables, etc. *In the lump* is the whole together. *Lump sum*, a full payment in cash.

Lump-fish. A sea-fish of the genus *Cyclopterus* (*C. lumpus*). Its head and body are deep, thick, and short; the pectoral fins unite under the throat, and with the ventral fins form a single disk. It is soft, without scales, but covered with firm, horny spines. Called also *lump-sucker*.

Lumper. A dock-laborer. A person employed in loading or unloading vessels.

Lunar (*Lat. luna*, the moon). Pertaining to the moon. A short term for *lunar observation.*

LUNAR DAY. The interval between two transits of the moon over a meridian.

LUNAR DISTANCE. The moon having a very

rapid proper motion, her distance from other bodies which lie in her path varies very perceptibly in short intervals. Hence these distances have been made the foundation of one of the most important methods of determining the longitude at sea. In the Nautical Almanac are registered for certain dates the angular distance of the moon's centre from certain bodies as they would appear to an observer at the centre of the earth. When a lunar distance has been observed at any station on the surface of the earth, and reduced to the centre by clearing it of the effects of parallax and refraction, the Greenwich mean time corresponding to this true distance can be found from the tables by the method of interpolation.

Lunar Inequality. A variation in the moon's motion depending upon its distance from the sun.

Lunar Observation. A measurement of the angular distance of the moon from another heavenly body, with the altitudes of each, and the chronometer time of observation for computing the longitude.

Lunation. The *lunar month*, or, as astronomers call it, the *moon's synodical period.* It is determined by the recurrence of the moon's phases, and is reckoned from new moon to new moon,—*i.e.*, from leaving her conjunction with the sun to her return to conjunction. In consequence of the sun's proper motion in the heavens in the same direction with that of the moon, the latter body, after leaving the sun, will have more than a complete circle to perform in order to come up to the sun again. Hence a lunation exceeds the moon's sidereal period; its mean length is calculated to be $29^d\ 12^h\ 44^m\ 2.87^s$.

Lunisolar Precession. That part of the precessions of the equinoxes which is caused by the combined action of the sun and moon.

Lunisolar Year. The space of time at the end of which the eclipses occur in the same order. It is found by multiplying the cycle of the sun by that of the moon.

Lunitidal Interval. The interval between the moon's transit and the high-water next following. It varies from day to day during the fortnight between new and full and full and new moon. The lunitidal interval must not be confused with the *retard* or *age of the tide.*

Lunge. A thrust with a sword or boarding-pike.

Lupus. See Constellation.

Lynx. See Constellation.

Lyra (Lat. "The Lyre"). A constellation to the south of Draco and Cygnus. It contains one bright star *α Lyræ*, also called *Vega*, which may be known by its being situated at about the same distance from the pole-star on one side as Capella is on the other, and by its propinquity to the conspicuous pair of the Dragon.

M.

M. Of the letters used in the log-book to indicate the state of the weather, *m* denotes *mist.*

Maash. A large trading-vessel of the Nile.

Macao. A seaport town in China belonging to the Portuguese, on the island of Macao, at the southwest entrance of the Canton River, in lat. 22° 11′ N., lon. 113° 32′ E. The town is situated on a semicircular harbor, which is defended by forts north and west of the town. Large ships anchor in the roadstead east of the island, as the harbor will only admit vessels of light draft. The Portuguese obtained their footing in 1560, under pretext of erecting sheds for drying goods alleged to have been damaged in a storm. These sheds gradually gave way to substantial edifices, and finally to forts. The Chinese, however, held, until 1863, a lien upon the place, requiring of the Portuguese a rental of 500 taels, and retaining jurisdiction over their own people. After the rise of Hong Kong the commerce of Macao almost entirely disappeared; but its trade has been somewhat revived by making it a free port. Pop. 72,000.

Machias, Washington County, Me., is on the Machias River, about 10 miles from the Atlantic Ocean, and 70 miles E. by S. of Bangor. It is mainly supported by the coast trade, lumber business, and ship-building. It is also a port of entry. Pop. 2500.

Machine. An instrument of a lower grade than an *engine*, its motor being distinct from the operating part; it is of a higher grade than a *tool.* The word *machine* in its widest sense may be applied to every material substance and system, but it is generally restricted to works of human art.

Machinery. Machines collectively; the works of a machine, engine, or instrument so arranged and constructed as to apply and regulate force; as, the *machinery* of a watch.

Machine-guns. A machine-gun is a cannon in which the essential operations pertaining to continuous fire are automatically performed by machinery.

These operations are: 1. The supply of the cartridges and their insertion into the chamber and retention there during the discharge. 2. The storing up of the blow required for their detonation and the delivery of that blow. 3. The extraction of the fired cartridge-cases from the chamber and their ejection from the gun. 4. The direction of the gun in continuous firing.

The continuous operation of the parts required by the above definition should exclude from this class of guns those requiring or permitting simultaneous loading and discharge, and hence those in which the fire is consecutive but intermittent, like revolvers. The former class, often confounded with machine-guns, are properly *mitrailleurs*, or volley-guns, deriving their name

from the weapon of this character which first attained decided celebrity in France in 1870, and which in turn inherited its name from the cognate term long used to designate the simultaneous discharge from a single gun of a large number of small projectiles contained in a single envelope. Canister, grape, shrapnel, and even bird-shot are generically *mitraille*.

Among the mitrailleurs are included various parallel or slightly diverging systems of barrels arranged either side by side in a row, or, for economy of space and mutual support, grouped together in a bundle.

The former arrangement finds its prototype in the labor-saving device of the proof-master, crudely imitated in Flanders in 1347, where 4 breech-loading tubes of small calibre were mounted on a two-wheeled carriage, and by Fieschi, in 1835, in the infernal machine designed for the assassination of Louis Philippe. This was improved on by the American Requa, in 1861, who used breech-loading cartridges, thus permitting the barrels to be simultaneously loaded by mechanical means. A similar device was employed in the Franco-Prussian war, and is now known in Europe as the Abbatini.

This variety finds its last stage in the Nordenfeldt (Swedish) gun, which, while capable of simultaneous loading, admits of either simultaneous or consecutive fire. Its intervals are so short, however, that the intermittent character of its fire is hardly perceptible, and the gun may properly be classed either as a mitrailleur or a machine-gun.

The arrangement of the barrels in a bundle is so evident an advantage that it was naturally adopted at an early date. The barrels being stationary, are loaded by means of charging-blocks or plates pierced to correspond with the barrels, and serving to guide the cartridges simultaneously into their proper chambers from the rear. The motion of pressing the cartridges into place also serves in various evident ways to compress certain springs in the rear, which, on being released, either simultaneously or in succession fire the charge; or the cocking may be done independently.

Such are the French mitrailleur, the Taylor gun of about the same date, and others.

One evident objection to the forms of mitrailleur so far described is the recoil. When it is considered that some forms fire from 25 to 37 shots at once, it will be readily seen how the aim of the gun may be deranged and a constant correction required, which, aside from the heat of action, may be impossible from the smoke of the previous discharge.

Hence the development of the revolver principle, by which a cluster of barrels loaded at leisure could be fired in rapid succession. Once discharged, however, the time required to reload gives the fire an intermittent character, which takes it out of the class of machine-guns.

The origin of the revolver can be found as far back as the fifteenth century, when at an early stage of its career, the idea was improved on by diminishing the aggregate weight of the barrels by making them as short as possible, and bringing them successively opposite to a single tube of suitable length for aiming and for completing the combustion of the charge.

The axis of revolution is generally parallel to that of the barrel, but cases are not rare where it is at right angles, and either vertical or horizontal.

An example of the former kind is found in one of the earliest English patents for fire-arms, No. 418, A.D. 1718, granted to one Puckle. His "Portable Gun, or Machine called a Defense," contains, though crudely, some of the most recent improvements in the accessories of machine-guns, and is a close approximation to a weapon known as the "Union Repeating or Coffee-mill Gun," used in the war of the Rebellion. The latter, though, was properly a machine-gun.

Puckle's principal limitation seems to have been the "state of the arts" at the time of his invention; that fatal tether which has checked so many a self-reliant Icarus, and brought him back to earth to await the slow co-operation of the evolution he had forestalled.

Nowhere can the effects of such a bar be more plainly seen than in the tardy development of the ammunition intended for these guns; the most simple, evident, and essential feature of which, the gas-check, was so long unknown.

The invention and perfection of the self-primed, sheet-metal cartridge has been the main factor in the success of machine-guns,—not only for those qualities which have rendered possible the well-known development of portable fire-arms, but for the special necessity to machine-guns of the rigidity of construction and invariability of dimension which characterize the best ammunition of the present day.

The automatic nature of the mechanism in the gun, by which the continuous motion of the hand is transmuted into the complicated movements of the parts, by which so many conflicting operations are rapidly performed in so restricted a space, while possessing manifest advantages, deprives the operator of the benefits of a discriminating choice of the *material* with which his machine is supplied. Especially is this evident when one considers the exact time required to be kept in the relative motions of the parts, and the shock and strain to which all parts of this machine are subject at the discharge.

Hence the necessity for great regularity, both in the *food* and in the *feed*.

In the first place the cartridges must not only conform closely to each other when made, but must be so stiff and strong that their original dimensions will not be injured by transportation, by weather, or by time; and that when fired the least possible resistance will oppose the extraction of the empty cartridge-shell in all its parts, nothing being left behind to clog the machinery.

In the second place the form of the cartridges must be such and the special apparatus employed must be so arranged that the ammunition will be delivered to the machine so uniformly that its motion will continue unchecked, each cartridge falling into its appointed place exactly at its appointed time, thus enabling the gun to perform the functions of a true machine by delivering its product as long as its motion and its supply are maintained.

An individual soldier finding a cartridge too large or too small for his gun, or bursting in it, can readily discover the defect and may remedy it; but in a machine-gun, the works of which are concealed, and which, especially under excite-

ment, may be driven at their utmost speed, a slight defect may cause a jam which may be aggravated by misguided efforts for relief.

Hence the general deduction that the machine-gun depends principally on the perfection of its feed, and the feed upon that of the cartridge, or briefly, no cartridge, no feed; no feed, no gun.

The following are the principal machine-guns now extant:

I. Two or more stationary barrels parallel to each other in a horizontal plane.
   Gardner.—Two barrels.
   Nordenfeldt.—Five barrels.
   Taylor of 1878.*—Five barrels.

II. Rotary cluster of parallel barrels.
   a. Gatling.—Continuously rotating, and firing each barrel in each revolution while moving.
   b. Hotchkiss.—Periodically rotating, and firing each barrel in each revolution while at rest.
   c. Lowell.—Rotating at pleasure by hand for cooling and cleaning; firing consecutive shots through a single barrel at rest.

The following description is founded on the comparison of the different methods by which they perform the essential operations pertaining to a continuous fire.

Operation.—With one exception they are driven by the continuous motion of a crank, placed either on the side of the gun or directly in rear. The exception is the Nordenfeldt, in which a reciprocating motion is given to a horizontal hand-lever projecting to the right side.

The mechanical advantage of the former course is obvious, in that it avoids the resistance due to the inertia of the motor at each end of the stroke.

Feeding.—These guns are all fed from above by an arrangement of the cartridges side by side vertically; in one row for the rotary guns, and in as many rows as there are barrels for the other class.

The support for these cartridges is called a hopper, feed-case, feed-tube, or trough, according to circumstances. It may contain a weight supplied with a projecting thumb-piece, by which to accelerate the passage of the cartridges into the gun. In the Gatling the cross-section of the feed-case is continuous, save for a slit left for the movement of the thumb-piece up and down.

In the Nordenfeldt there is a compact group of such cases, but the weight, etc., are omitted. In the Gardner, Taylor, and Lowell guns the troughs are shallow and open in front, so as only to embrace the head of the cartridges. They can be readily filled by sliding into them with a scraping motion the heads of the cartridges as contained in the original packages. In these guns the troughs are vertical, opening to the front. In the Hotchkiss the cartridges roll into place successively down an inclined trough open on top.

All of these devices are sought to be arranged with reference to the rapidity of fire of the gun to which they are attached, so that the reserve contained in the hopper will not be exhausted before the next lot of cartridges can be supplied.

Loading.—The cartridges having been delivered from the hopper, are pushed into the barrel by a reciprocating piston in all the guns.

In the Gatling each barrel has its own piston revolving with it under the influence of the crank, but constrained to move obliquely to the axis in an elliptical orbit, by means of a corresponding stationary rib within the casing of the gun, but outside of the fluted cylinder which serves to guide the cartridges and pistons in their reciprocating path.

The action is thus progressive with each cartridge, but simultaneous for them all, giving an independent deliberation to each unit, but rapidity to the whole.

In the Hotchkiss, Lowell, Gardner, and Taylor guns the reciprocation of the piston is effected by various vertical cams actuated by the driving-crank. In the first two there is but one piston; in the last two there is one piston to each barrel, but its action is alternate.

In the Nordenfeldt gun each barrel has its piston, and they are moved together by the hand-lever.

Guiding.—The method of preventing the accumulation of cartridges in front of the piston, and of directing them into place, requires attention.

In the Lowell gun this is done by one or more deeply fluted "carrier rolls," revolving on an axis parallel to that of the gun, beneath the hopper and to one side of it. They take the nearest cartridge from the hopper in their flutes, guide it into its chamber, and receive its remains after the discharge.

The Gardner and Taylor guns require horizontally vibrating valves for this purpose, alternately cutting off and opening the mouth of the hopper.

In the Hotchkiss this is effected by a little trap-door, closing the mouth of the trough until the piston has receded from its insertion of the preceding cartridge into place, and has left the way clear for its successor to roll down into its front.

In the Gatling and Nordenfeldt guns this is accomplished by the proportion and arrangement of the contiguous parts.

Firing.—In almost every case the firing-pins are animated by spiral springs surrounding them, which are compressed against some projection during the forward motion of the piston in loading. The firing-pins being inclosed by the piston, are, so to speak, left behind until the moment has come for the blow.

In the Hotchkiss and Lowell guns the spring is compressed by a special cam on the driving-shaft. In both of these guns the firing takes place with the barrel at rest and in line with the axis, so as to avoid the deflection due to the recoil. With the Lowell gun, firing by simple pressure from the piston has been tried. In the Hotchkiss, the moment of rest during the firing is necessarily made use of for the loading and extraction.

Locking.—To support the cartridge against the discharge various similar devices are adopted, depending principally upon some flattening of the stationary or revolving cam by which the mechanism is actuated. This is extended somewhat to allow for a continued support after the moment intended for the explosion, in the chance of a cartridge missing fire. In the Hotchkiss, owing to the revolution of the cartridge away

* This is not the Taylor volley-gun of 1870, previously referred to.

from its loading-point, the recoil is borne directly upon the solid cast-iron breech-block.

Extraction.—The reciprocating motion of the piston readily suggests the spring-hooked extractor so commonly used in all bolt-guns.

In some cases it may work positively by contact with some projection serving to close its point in, but generally it depends upon its own elasticity for a hold. The hook is sometimes double.

Ejection.—The ejection is generally accomplished by the force of gravity alone, the cartridge falling on being swept off the hook of the extractor by a "plow," as in the Gatling, and dropping through a proper aperture to the ground.

The Gardner, Hotchkiss, and Taylor gun supplement this action by giving to the extracted cartridge-case a blow from an ejector to release it from the hooks. In the Lowell gun the extracted cartridge is drawn between the flutes of the carrier-rolls which guided it on its entrance to the chamber, and by their revolution is cast to the ground.

Direction of Fire.—The continuous fire of machine-guns, combining as they do in one weapon the force of many, requires an adequate distribution of their effect. Many ingenious devices have been invented to accomplish this result, but generally they are too complicated for this paper.

The horizontal dispersion seems likely to be generally effected by the simplest means, by slowly sweeping the gun in a horizontal plane during the act of firing, care being taken not to waste too many shots by unnecessary dwelling on the spot where the motion is reversed.

For this purpose the gun is generally mounted on a universal joint, moving independently of the carriage, and with its motion limited by suitable means.

For the vertical dispersion required in firing against torpedo-boats, and against objects requiring a rapid change of elevation, two especially ingenious devices have been adopted.

The Gatling has a lever projecting to the rear, and terminating either in a handle or in a crescent-shaped fork, supported at the gunner's waist by a strap passing over his shoulders. This handle is so arranged that at whatever elevation it may place the gun, simply relaxing the grasp of the hand sets it there, by releasing a binding wedge impelled forward by a spring.

The Hotchkiss has another arrangement better suited to the more deliberate nature of its fire. A crutch-like stock projects to the rear, to be drawn against the gunner's shoulder by the left hand, which grasps a convenient handle. Having thus complete control of the direction of the gun, his right hand can fire it at pleasure by an independent trigger, one assistant giving a continuous motion to the crank while another feeds.

Being thus able to follow by the splash of his bullets an attacking torpedo-boat, the gunner has an advantage at least equal to that of the Nordenfeldt mitrailleur, which is intended to deliver a searching volley as soon as the aim and elevation are found.

Ammunition.—The ammunition employed by these guns need only be limited in size, in any case, by the peculiar conditions of the gun. As a rule, on account of the unbounded supply of ammunition they require, they are intended to fire the ordinary infantry cartridge. But as this gives them no advantage in range over an opposing force of infantry, they are prone to increase their calibre and their range.

Rapidity.—The most rapid is the Gatling, which has been fired at the rate of 1000 shots per minute. The least rapid the Hotchkiss revolving cannon, which is timed for about 60 or 80 shots per minute. The rest vary, being at about the following rates: Gardner, 350; Lowell, 350; Nordenfeldt, 200–600. The Hotchkiss cannon makes up for its deliberation by firing a sensitive percussion-shell, which yields a large number of fragments on impact. Solid shot can also be used in it.

Great rapidity of fire cannot be long sustained, owing to the heating of the barrels which results. An ordinary breech-loading musket may easily be fired fast enough to blue the barrel and char the stock, so much more the machine-gun, which may fire 50 times as fast.

Adoption.—No one nation can be said to have exclusively adopted any one machine-gun.

England uses the Gatling on shore, and is said to prefer the Nordenfeldt afloat, in which respect she follows Norway and Sweden.

France, Brazil, and many other nations use the Hotchkiss cannon largely. The Gatling is under trial in Russia.

In the United States all of these guns but the Nordenfeldt are, or have recently been, under trial.

Conclusion.—Machine-guns are, generally speaking, auxiliary weapons for defense. In spite of their ingenuity and apparent advantages, they have not yet played a very important part in actual warfare.

U. S. Centennial Commission.—*Henry Metcalfe, Captain U.S.A.*

Mackerel. A genus of fishes of the family *Scomberidæ.* It has a spindle-shaped body, the tail tapering greatly and being slightly ridged on each side. It is a beautiful fish of brilliant green and blue, the males having nearly straight dark transverse bands, the females having the bands elegantly undulated. It is generally 14 to 16 inches in length, and about 2 pounds in weight. It is readily caught with the hook and line, but the greatest quantities are taken in nets. They were formerly supposed to be migratory, but it is now believed that they merely leave the deep water and approach the coast for the purpose of spawning. The *Spanish mackerel* attains a weight of 4 or 5 pounds, and is more obscurely banded. The *mackerel-midge*, a very small fish, is a species of rockling, of the family *Gadidæ.* The scad is sometimes called the *horse-mackerel.*

MACKEREL-BOAT. A stout clinch-worked vessel, with a large foresail, sprit-sail, and jigger.

MACKEREL-BREEZE. A smart breeze,—favorable for fishing for mackerel with hook and line.

MACKEREL-SKY. See CLOUD.

MACKEREL-STURE. A name for the tunny, *Scomber thynnus.*

Macomb, William H., Commodore U.S.A.

Born in Detroit, Mich., June 16, 1818. Midshipman, April 10, 1834; lieutenant, February 27, 1847; commander, July 16, 1862; captain, July 15, 1866; commodore, July, 1870. In sloop "Portsmouth," East India Squadron, 1856–58; engaged and captured the Barrier Forts, Canton, China, November 16–22, 1856; commanded "Metacomet," Paraguay Expedition, 1859; steamer "Genesee," 1862–63; attempted the passage of Confederate batteries at Port Hudson, March 14, 1863, and was in frequent actions with Confederate batteries in April to June, 1863; commanded "Shamrock," North Atlantic Blockading Squadron, 1864–65; commanded naval force in capture of Plymouth, N. C., October 30, 1864, and in action with Confederates on the Roanoke River, near Poplar Point, N. C., and for his gallantry and energy in this service was advanced in grade; commanded steam-sloop "Plymouth," European Squadron, 1869; lighthouse inspector, 1871. Died, 1872.

Macrodactyl (Gr. *makros*, long; *dactylos*, a finger). A tribe of wading birds comprehending those in which the toes are remarkable for their extreme length, by means of which they walk upon the floating leaves of aquatic plants.

Macrometer (Gr. *makros*, long; *metron*, a measure). An instrument for measuring the distance of inaccessible objects by means of two reflectors.

Macropod (Gr. *makros*, long; *pous*, foot). One of a tribe of short-tailed decapodous crustaceans remarkable for the enormous length of their feet; the sea-spider, or spider-crab.

Macrourans (Gr. *makros*, long; *oura*, the tail). A section of decapod crustaceans, including all those which have the tail, or post abdomen as long as, or longer than, the body.

Mactra. A genus of lamellibranchiate mollusks, having a somewhat triangular shell. It is sometimes called *trough-shell*. The species are numerous and widely distributed. They burrow in the sand and mud of sea-shores and of the bottom of the sea. Their large, compressed foot enables them also to move with activity after the manner of cockles. The shells of some of the species are not lacking in beauty, while those of other species are coarse. Certain small species that abound on the coasts of Great Britain are gathered and fed to pigs. The fossil species are few.

Maculæ. Dark temporary spots which are very frequently observed upon the sun's disk; they are of various forms, surrounded by a lighter shade or penumbra.

Mad. The state of a compass-needle, the polarity of which has been impaired.

Maddy. A large species of mussel.

Made. Built up; composed of several pieces. A *made-block* is one in which the shell is composed of several pieces in contradistinction to a *mortised-block*, in which the shell is a single piece of wood. A *made-mast* is composed of several pieces hooped together, in contradistinction to a single-spar mast.

Madoc. A Welsh navigator whom his countrymen credit with having discovered America 300 years before Columbus sighted the island of San Salvador. He was the son of Owen Gwynnedd, a Welsh prince, and the tradition is that, being compelled by civil commotion to leave his native land in 1170, he sailed westward with a small fleet, and after a voyage of several weeks reached a strange country differing from Europe both in its inhabitants and its productions. After a considerable stay he returned to Wales and gave glowing accounts of the new land he had discovered. He got together another fleet and set sail again, but was never afterwards heard of. Southey has made the story of Madoc the subject of one of his "epics."

Madras, a maritime city of British India, in lat. 13° 4′ 6″ N., lon. 80° 14′ E., is situated on an open sandy shore, without a harbor or landing-place, and vessels are obliged to anchor in the roads in from 7 to 9 fathoms of water, exposed to the swell from the Bay of Bengal, which breaks upon the beach with great violence. The natives use catamarans as surf-boats, in which they venture out to ships in the heaviest weather. From October to January storms and typhoons prevail, and from the 15th of October till the 15th of December the anchorage is very unsafe. The first British settlement on this coast was at Armagon, 60 miles north of Madras, but the seat of the present fort being granted by a native prince in 1639, the nucleus of the city was formed. It soon became a flourishing place. In 1744 it was taken by the French, but was restored to the English in 1749. The roads and city are protected by Fort St. George, which is admirably situated for their defense. The imports consist of cotton goods, grain, spirits, metals, sugar, etc., and the exports of cotton, indigo, saltpetre, pepper, etc. Madras stucco, or chunam, is much used in the decoration of buildings, and also for paying the seams of ships. Pop. 398,000.

Madrier. The sheathing of a galley.

Maëstral. See MISTRAL.

Magalhaens. See MAGELLAN.

Magazine. A chamber in a gun containing a number of cartridges which are fed automatically to the piece. An apartment devoted exclusively to the storage of powder. Large vessels have two, one forward and the other aft. Magazines should be rectangular in form, and should be built strong to resist the working of the ship in heavy weather, and the pressure of water when flooded. As a protection against the fire of an enemy, the magazine should be as far as possible below the water-line. It should not touch the bottom nor the sides of the ship, but should be battened off to permit the bilge-water to run under it. The magazine and passage must be thoroughly calked, and lined with pine boards tongued and grooved, and over all, sheets of lead soldered together. There should also be an external lining of sheet-iron as a protection against fire and the intrusion of rats. All the metallic fixtures should be of copper, and magazine-dresses must always be worn by all persons entering the magazine. As a security against lightning, a magazine must be placed so as not to include a pump-well, mast, or anything connecting with the spar-deck. The alleys of a magazine run fore-and-aft, and there should be a communication between the two; each alley has a separate light-box. A sponge dipped in salt water, dried, and weighed, is used to detect dampness; if the sponge becomes heavier, the magazine is damp. Grating-hatches are fitted, to afford a supply of air to the men, and a ventilating apparatus is, also, generally furnished for this purpose. When-

ever the magazine is opened, every precaution is taken to guard against fire, the galley-fires and open lights being extinguished, and the magazine-scuttles screened off. The men are required to wear magazine-dresses, and no metallic article is introduced into the magazine. Coopering is prohibited in the magazine; when powder is received in barrels, the hoops are started on the berth-deck. See POWDER.

MAGAZINE-COCKS. Each magazine is fitted with a cock for flooding, and one at the bottom for emptying the magazine after having been flooded. There is also a waste-pipe at the top for carrying off the superfluous water when flooded. Both cocks should be so fitted that they may be turned from the deck above. The flood-cock should also have a lever in the passage accessible to the gunner in action.

MAGAZINE-DRESS. A worsted frock to reach to the knees; no metal buttons are worn. The shoes are made wholly of cotton canvas or buckskin; india-rubber and woolen slippers are prohibited.

MAGAZINE-PASSAGE. A small apartment cut off from the main body of the magazine, and communicating with it by means of small doors, which are only opened to permit ingress or egress. The cartridges are passed out through a small scuttle in the door, and thence to the deck above.

MAGAZINE-SCREEN. A screen made of thick fearnaught or double baize, so hung as to protect the scuttle of the magazine-passage from sparks or flame.

Magazine-gun. A portable fire-arm, containing a limited supply of cartridges, which are automatically fed into its chamber. (Adapted from Knight.)

The magazine-gun differs from the *machine-gun* chiefly by the added difficulty of the conditions regarding its portability and the convenience of handling it.

If the limited space afforded to the working parts of a field-piece, and the mobility required for its support, have been found important obstacles to the development of machine-guns, how much more heavily handicapped is the magazine-musket, which neither in weight nor in dimension can greatly exceed the single-barreled muzzle-loader of former times, but which must be capable of easy and certain working, by a single individual, in every operation pertaining to the machine-gun, in whatever position and at whatever speed it may be fired. Its only *point d'appui* also, in case of a mechanical mishap, being the yielding support of the left hand to oppose the unaided efforts of the right.

If the machine-gun had to suffer for the want of a good cartridge, so much the more therefore was the evolution of the magazine-gun delayed.

Before discussing the magazine-guns of the present day, which are all of recent origin, it may be well to examine some of the expedients resorted to in former times to obtain a consecutive fire.

Naturally the multiple-barrel, mounted on a single stock, was one of the earliest forms.

A curious example is found in a weapon ascribed to the Black Prince, son of Edward III. of England, date 1370. It consists of a sort of cylindrical iron mace on the end of a stout staff. It is belted by two cheerful rings of spikes, and is pierced so as to form four barrels, the means of discharging which have not been preserved. It rejoiced in the name of "Holy-Water Sprinkler," or "Blood-Spiller," depending, it is supposed, on the end from which it was seen.

Without reverting to other familiar forms of this type, such as the double-barrel, either side by side or superposed, and the revolver, the development of which has often been described, some account may be given of the efforts made to lighten the load imposed by this clumsy accumulation of independent barrels.

Single-barreled muzzle-loading guns have long been made to act as repeaters, the charges being superposed, and fire being communicated to them by a movable lock sliding along the outside of the barrel, or by a stationary lock, with different ducts for each charge.

The discharge has also been arranged to be consecutive by means of small openings through the bullets or alongside of them. Such was a "great brass hand-gun" described by Porta in his "Natural Magick," 1658.

This gun has recently been re-invented, and the two former types were exhibited in Philadelphia in 1876.

In all these cases the intention was to fire the top charge first, but of course the inflammation was often instantaneous, leading to a simultaneous discharge, with all of its disastrous results.

An exception to the general inutility of multi-barreled muzzle-loading fire-arms may be made in the case of the revolver, in the later forms of which the cylinder was, mechanically speaking, as regards completeness, rigidity of construction, certainty of feed and of fire, and the protection of its contents, *one* divisible cartridge.

At no time, however, was it safe from the chance of the simultaneous explosion of several of its charges, until, by the invention of the present cartridge, its safety could be assured without loss of its efficiency.

The Spencer was the first magazine-gun to attain decided celebrity, and in its prompt, complete, and satisfactory utilization of the state of the concurrent arts it still deserves our grateful distinction and regard.

It failed principally from the objection justly found to the superposed column of cartridges in the butt-stock. Although rim-primed, they were occasionally known to explode when jolted, as by the cavalry, to whose service the arm was otherwise so evidently adapted.

Apart from this objection which has been overcome in recent ammunition, the arm would have failed to meet our present need for a longer cartridge than could well be fed over its curved breech-block, and for a heavier charge of powder than could be safely loaded in the thin rim-primed shell, which was then considered essential to its use, and which was indeed almost the only shell in service.

The want of a proper cartridge caused the failure of this gun; but it was from actual experience in warfare with this weapon, even in its imperfect state, that the strongest arguments are derived by those who oppose the prevailing opinion that the use of repeating arms will result in a dangerous waste of ammunition in battle.

The statement has been made by a distinguished officer, that of two brigades of equal strength, equally engaged on the same side in the bloody battles around Richmond near the close of the war of the Rebellion, the brigade armed with the

Spencer was found, after several days' fighting, to have expended less ammunition than that which had the muzzle-loader.

Experience soon taught the soldier the value of the "pocket-pieces" he carried in the butt of his gun, and he reserved them until the need for their expenditure was dire.

The Henry magazine-rifle, originally known as the Volcanic repeating-rifle, and now as the Winchester, was the only other prominent magazine arm during the war of the Rebellion. It is used now in part by Turkey, while a close approximation to the Winchester—the Vetterli—is adopted by Switzerland and Italy.

An instructive example of the misguided efforts of inventors, who seek only by combination to improve, may be found in the Kirk and Rumsey modifications of the foregoing weapons. In one case there are 7 magazine tubes, and in the other 2 in the same gun. (Report Chief of Ordnance, 1873.)

General Requirements.—It follows from the automatic loading of magazine-guns that what is essentially a longitudinal sliding motion must be given to the part by which the breech is opened and closed; so that the cartridge once placed in line with the chamber shall be pushed directly into it.

Some cases occur in which the breech-block is hinged beneath the barrel as in the Spencer, but it is on so distant a centre that its motion is practically direct.

Hence the prevailing adoption of the sliding bolt as shown by Table I. hereafter, both on account of its simplicity in loading and for the readiness with which it lends itself to the subsequent operations with cartridges of any reasonable length.

For example, by a natural and continuous motion it is easily opened and closed, and locked or supported against the force of the discharge by turning one or more projections on it into corresponding notches in the frame in which it slides. Its motion also serves naturally either in opening or closing to compress a spiral spring surrounding an axial firing-pin, by which the cartridge may be fired; or else to cock an ordinary outside hammer in rear for the same purpose.

In the first of the former cases the spring is ordinarily compressed from the rear, between the bolt and a shoulder on the firing-pin, which rests against the sear. When the sear is pulled down out of the way by the trigger the blow will fall. Should the cartridge miss fire, as the cocking is dependent on the entire movement of the bolt, the bolt must be again withdrawn, which opens the gun unnecessarily. The extent of the compression which this method of cocking admits of permits the use of a long and elastic spring, which has certain mechanical advantages to offset the above defect.

In the second form the spring is compressed from the front, generally by the preliminary motion of loading in turning up the handle to open the piece. The independent operation of this form and of the class of outside locks relieves them from the disadvantages of the former combination.

The bolt-gun also offers the most ready form of extractor, the spring hook, which also lends itself so naturally to the ejection.

For almost any slight shock or resistance opposite to the extractor, across the face of the bolt, serves to flip the cartridge from its hold and send it spinning from the gun.

The direct action of the bolt, while offering these advantages, has certain defects which it has taken years of effort to overcome.

The most evident objection to the motion is the danger of an accidental explosion in closing, from the effect of the blow which some unusually sensitive cartridge may receive; particularly if its entrance into the chamber should be checked, or the point of the firing-pin should protrude.

This is met by three devices: 1. In all good bolt-guns the firing-pin is positively retracted within the block by the very motion of opening, and is kept back until the time comes for the piece to be fired. This is variously accomplished by contiguous spiral surfaces or cams, changing the rotary motion of the bolt in opening the gun into a longitudinal motion of the firing-pin. 2. In the act of closing, the face of the bolt strikes some spiral surface, along which it gradually advances as it is turned down into place, so as to relieve the cartridge itself of any shock, by screwing it, as it were, into its place.

3. The face of the bolt carrying the extractor is made loose upon its axis, so that in turning down it shall not grind the head of the cartridge either about the fulminate nor under the flange where the extractor bears.

This convenient transmutation of the rapid, direct, reciprocating motion of the bolt into a slow rotary motion is also made available for the first operation of extracting, as follows: The principal resistance offered by a cartridge to extraction lies in the start; if the backward pull is given too suddenly the extractor may break, or its hook may ride over the rim of the cartridge or cut through it; but if it is started slowly its subsequent withdrawal is an easy matter, owing to its conical form and that of the chamber in which it lies.

This has given rise to various plans by which the first rotary motion of opening is converted into a slow longitudinal motion, serving not only to start the cartridge, but also to half or full cock the piece, and retract the firing-pin as before described.

Sure extraction and ejection are even more important in magazine-guns than in the ordinary breech-loader, for if the spent shell be left in the chamber, or be not ejected in time, the succeeding cartridge may be driven against it with such force as to block and injure the gun.

So far have been considered the functions which the magazine-gun shares with the ordinary breech-loader, but in which, from the necessity of the case, much greater perfection of operation is required. There remains to consider the fundamental difference, which is the supply of the cartridges from the magazine to the part by which they are passed into the chamber, or the feed.

However this may be accomplished, it should have the following conditions and be free from the following defects, viz.:

1. It should be prompt, direct, automatic, sure, and continuous within the limits of the supply.

A failure in either of the last respects, if unobserved, exposes the firer to the confusion and other evil consequences of a misfire, on which his life may depend.

The cartridge should be guided into the chamber so that it may enter freely when driven forward by the breech-block.

The cartridge should be guarded against loss while in transit.

2. The feed should be regulated so that not more than one cartridge should escape from the magazine at once, otherwise the gun may be blocked, or cartridges may be lost.

This result is effected by various forms of automatic *magazine stops*. Being in a concealed position they should be strong, simple, and positive in their action. They should not depend upon invariability in the length of the cartridges employed, which will vary both in manufacture and from the jolting they receive in the magazine.

3. It should have a simple cut-off, by which the piece can be used as a single-loader, holding the magazine in reserve.

To prevent confusion this condition of the gun should be plainly indicated outside, and for safety so should the fact of its being cocked.

4. It should be capable of easy replenishing without unnecessary exposure of the working parts.

5. It should be adapted to the standard infantry ball-cartridge without loss of its accuracy and range, and with sufficient latitude to permit of the easy adaptation of the system to other special ammunition,—carbine, long-range, blank, etc.

6. It should be free from the risk of accident due to the inadvertent inversion of a cartridge in filling the magazine.

7. Taken together with the cartridge used, it should be free from the danger of an accidental explosion of the contents of the magazine or carrier, due to the escape of gas from defective cartridges.

8. The firing-pin or hammer should never fall before the block is securely and independently locked. Otherwise, even if no accident result, the effect will be the same as of a misfire.

Generally speaking, the construction of the piece should involve no difficulty in its poise, in working it, or in handling it as in drill or on the march. Its strength as a whole should be sufficient to resist ordinary accidents of transportation and service. The parts, besides being strong enough for their respective functions, should not depend upon too close fitting, or have too many "working points." A certain freedom of motion should be sought, not only on account of the resulting economy of manufacture and the avoidance of repairs, but to overcome the injurious effects of rust, dust, and dirt. The parts should be readily accessible without special tools, but should not be liable to be accidentally detached. Their motions should be positive, depending on their relative forms rather than on the use of springs or the force of gravity; and pins, rather than screws, should be preferred in their connections.

Finally, combination of the parts should be avoided rather than sought; each part should have as far as possible a distinct duty which it may be depended on to fulfill.

As will be seen by Table II., the position of the magazine has much to do with the performance of the gun.

As a rule, the cartridges are carried in a tube, experiments having shown that the perfected central fire cartridge may be less dangerous when so carried than the old rim-fire cartridge so long considered essential to a magazine arm. An escape from the apparent danger of the central-fire cartridge has been sought in various ways:

1. Making the point of the bullet flat or sunken.

2. Sinking the primer beneath the head of the cartridge, separately or in combination with 1.

3. Making the primer small in diameter, and not sensitive, depending for the certainty of its ignition upon a powerful lock, or a sharp firing-pin.

A single tube is generally used, though several tubes are sometimes assembled as a fluted cylinder, rotating, 1st, automatically, or, 2d, intermittently, at pleasure.

When a single tube is used it may be either above the barrel or beneath it, or in the butt-stock. The last is the better position, on account of the poise of the arm being less affected by the consumption of the cartridges in the magazine. It has, however, less capacity than the other form, the length of which is only limited by that of the barrel.

The clustered tube is generally found in the butt, replacing the "small" of the wooden stock, and its prolongation to the butt-plate.

To further protect the superposed cartridges, they are often kept apart by a long notched slide, or a fixed spiral surrounding a rotary fluted cluster. (Evans.)

To avoid all possible danger from this source, in one gun, Lee's, the cartridges are fed upwards side by side, through a mortise in the bottom of the groove in which the bolt works, and in front of the bolt when it is drawn back. This mortise interferes somewhat with the use of the gun as a single-loader.

The cartridges are generally expelled from the magazine by a spring, sometimes by the force of gravity, and sometimes, as in the Evans gun, positively by the operation of the parts.

They are sometimes, as with the Lee and Hotchkiss, delivered directly in front of the breech-block or bolt, but more frequently have to be transferred to a different level by a carrier; as in the Spencer, Winchester, Ward-Burton, etc.

In the report of the Board of Officers of which Gen. Alfred H. Terry was president, appointed in pursuance of the act of Congress, approved June 6, 1872, for the purpose of selecting a breech system for the muskets and carbines of the military service, may be found the following opinion on the value of magazine-arms:

"*Resolved*, That in the opinion of the board the adoption of magazine-guns for the military service by all nations is only a question of time; that whenever an arm shall be devised which shall be as effective as a single breech-loader, as the best of the existing single breech-loading arms, and at the same time shall possess a safe and easily manipulated magazine, every consideration of public policy will require its adoption."—May 5, 1873.

No magazine-gun was adopted thereafter by the United States until upon the report of a Board of Ordnance Officers convened in conformity with the act of Congress, approved November 21, 1877, to select a magazine-gun for the military service. The Hotchkiss gun was recommended September 23, 1878.

To the very full and interesting report of that board by Capt. John E. Greer, of the U. S. Ordnance Department, and to the report of the former

board by the writer, found in the reports of the Chief of Ordnance to the Secretary of War,—1873 and 1878,—the reader is referred for the details of almost all prominent magazine-guns now extant. See also Lieut. T. B. M. Mason's (U.S.N.) translation of Report of French Naval Board, New York, 1879.

The following tables are taken from Capt. Greer's report, as giving in the most condensed form the information generally desired:

Table I.

** Classification of magazine-guns founded on the motions of the principal part by which the breech is opened and closed.*

Breech-loading small-arms have—	fixed chambers closed by—	movable breech-blocks which are—	1st, sliding—	in line of axis of barrel by—	1st, direct action, *i.e.*, bolt-guns having—	1st, concealed locks		Hotchkiss. Remington. Burton. Ward-Burton. Franklin. Lee. Sharps Rifle Company. Kropatschek (*Fr. navy*).
						2d, centre locks		Hunt.
					2d, indirect action, *i.e.*, moved by levers from—	below		Winchester. Burgess. Tiesing.
			2d, sliding and rotating					Buffington. Chaffee.
			3d, rotating about an axis—	at 90° to axis of barrel, and—	horizontal, lying—	1st, above axis of barrel, and in—	front	Springfield-Miller. Springfield-Clemmons.
						2d, below axis of barrel, and in—	front, moved from— below (by a lever)	Lewis-Rice.

Table II.

Classification of magazine-arms founded on the method by which cartridges are fed from the magazine.

Magazine-arms.	supply chamber with cartridges from—	1st, butt-stock	1st, by a spring	1st, direct			Hotchkiss. Lewis-Rice. Spencer.
				2d, indirect	1st, by rotating barrel about axis parallel to it into line with magazine.		Scott and Triplet.
					2d, to position opposite receiver		Clemmons.
			2d, by a ratchet, which is—	1st, automatic			Chaffee.
				2d, operated by hand.			Springfield-Miller.
			3d, by a spiral cam (screw motion)				Evans.
		2d, tip-stock	by a spring—	on a carrier which is—	1st, sliding, at right angles to axis of bore		Winchester. Henry. Hunt. Vetterli.
					2d, rotating—	1st, to position oblique to axis of bore	Burton. Ward-Burton. Sharps. Remington. } Kropatschek.
						2d, to position parallel with axis	Tiesing. Burgess.
					3d, sliding and rotating—		Buffington.
		3d, magazine on top of barrel	by a spring—	to position parallel to axis of bore and above receiver—	and by gravity into line with axis of bore.		Franklin.
		4th, magazine below bolt	by a spring (vertically)—	to position opposite centre of chamber.			Lee.
		5th, revolving chambers.					Hodges. Colt's repeating-rifle. Revolving pistols.

* Classification similar to that given in Ordnance Memorandum No. 15.

Table III.—Abridgment.

*Showing the performance of the four principal magazine-guns before the board under the following rules marked *.*

Name of Gun.	No. of Cartridges carried.	Weights.		Rapidity of Fire.																	
				With Accuracy—Shots in 2 minutes.								At Will in 1 Minute.				Time of Firing 20 Shots with Aim.		Time of Firing 6 Shots—in Seconds.

Tests to which the above guns were subjected.

REGULAR TESTS.

Safety test: To be fired 10 *rounds by the exhibitor or with a laniard.*

The piece to be first fired 10 rounds by the exhibitor, as a test of safety; the same firing to be also a test of rapidity by one familiar with the arm. The time to be noted in the record.

The firing to be then continued according to the rules annexed, by an employé of the armory, or soldier detailed by the War Department.

The service-cartridge to be used in all cases.

I.—Rapidity with Accuracy.*

The number of shots which, fired in two minutes from the gun,—both as a magazine-gun and as a single-shooter,—strike a target 6 feet by 2 feet at a distance of 100 feet. Any cartridges missing fire in this or other tests to be tried with a prick-punch, or opened to ascertain the cause of failure. The test to be begun with the chamber or magazine filled; other cartridges to be disposed at will on a table.

II.—Rapidity at Will.*

The number of shots which can be fired in one minute, irrespective of aim, under the same circumstances as in Test I.

III.—Endurance.

Each gun to be fired 500 continuous rounds without cleaning, using the magazine. The state of the breech mechanism to be examined at the end of every 50 rounds.

IV.—Defective Cartridges.

Each gun to be fired once with each of the following defective cartridges: 1. Crossed-filed on head to nearly the thickness of the metal. 2. Cut at intervals around the rim. 3. With a longitudinal cut the whole length of the cartridge, from the rim up. A fresh piece of white paper, marked with the number of the gun, being laid over the breech to observe the escape of gas, if any occur.

V.—Dust.

The piece to be exposed in the box prepared for that purpose to a blast of fine sand-dust for two minutes; to be removed, fired 20 rounds, replaced for two minutes, removed and fired 20 rounds more.

VI.—Rust.

The breech mechanism and receiver to be cleansed of grease, and the chamber of the barrel greased and plugged, the butt of the gun to be inserted to the height of the chamber in a solution of sal-ammoniac for ten minutes, exposed for two days to the open air standing in a rack, and then fired 20 rounds.

VII.—Excessive Charges.

To be fired once with 85 grains of powder and one ball of 405 grains of lead; once with 90 grains and one ball, and once with 90 grains and two balls. The piece to be closely examined after each discharge.

SUPPLEMENTARY TESTS.

1st. To be fired with two defective cartridges, Nos. 1 and 2, and then to be dusted five minutes, the mechanism being in the mouth of the blow-pipe, and closed, the hammer being at half-cock; then to be fired 6 shots, the last two defective Nos. 1 and 2; then, without cleaning, to be dusted with the breech opened, and fired 4 shots. The piece to be freed from dust only by pounding or wiping with the bare hand.

2d. To be rusted for four days after immersion as before, and then fired 5 rounds with the service-cartridge; then, without cleaning, to be fired 5 rounds with 120 grains powder and a ball weighing 1200 grains; the gun to stand twenty-four hours after firing without cleaning, and then to be thoroughly examined.

Provided, "That all arms selected for supplementary tests be rusted simultaneously, *i.e.*, that they be immersed at the same time, for ten minutes, in the same sal-ammoniac solution, and afterward exposed side by side to its corroding action for four days, when they will each be fired 5 rounds with service-cartridges; then, without cleaning, fired 5 rounds with 20 grains of powder and a ball weighing 1200 grains; after this, each gun to stand twenty-four hours without cleaning, and then to be thoroughly examined."

* 3d. Facility of manipulation by members of the board.

"That to determine the comparative rapidity of fire and facility of manipulation, as contemplated by the third supplementary test, each gun be fired 20 shots by three enlisted men of the armory detachment, loading from the cartridge-box and firing with aim at a target 6′ by 24′ 100 yards distant. The average of the three trials to be the recorded time of firing 20 rounds. The magazine to be loaded from the cartridge-box before the start, the remainder of the cartridges to be fired away first, using the gun as a single-shooter, and the magazine to be emptied last."

Aside from the magazine-guns proper, which depend on an automatic feed, many devices called

detachable magazines have been invented, some of them attached to the person of the firer, as well as to the gun. (See report above, 1873; also Lieut. Greene's Report on Russo-Turkish War, 1878.)

These devices occupy an intermediate place between the single breech-loader and the perfected magazine-gun, but owing to the rapid development of the latter arm have not been received with favor.

As with machine-guns, but owing to the success of the Spencer, in a less degree, magazine-guns have yet to win their spurs by actual conflict in battle with single breech-loaders of good quality in the hands of equally good troops.

Speculation as to their future is useless, except as far as it shows the general drift of public opinion in their direction. It is safe to say that they will not be generally adopted until the development of many other questions affecting the supply of their ammunition has been greatly advanced.—*Henry Metcalfe, Captain U. S. Army.*

Magellan, or Magalhaens, Fernando de. A famous Portuguese navigator, born about 1470; died April 27, 1521. He served under Albuquerque in the East Indies, and especially distinguished himself at the taking of Malacca, in 1511. He afterwards entered the Spanish service, and was intrusted by Charles V. with the command of a fleet destined to explore a passage to the Molucca Islands by sailing westward. The voyage was begun September 20, 1519. About the end of October, 1520, he entered the strait since called after him, and November 27, discovered and named the Pacific Ocean. Continuing his course, he arrived at the Ladrone Islands about March 6, 1521, and subsequently at the Philippines, on one of which he lost his life in a skirmish with the natives, or, as some accounts state, by the mutiny of his crew. One of his ships, with 18 men, escaped, and reached Seville, September 8, 1552, under Sebastian del Cano, who first circumnavigated the globe. An Italian named Pigafetta, who accompanied Magellan, kept a journal of this last voyage, which was published.

Magellanic Clouds. Nebulous patches near the south pole of the heavens. Early voyagers called them the "Cape Clouds," afterward they were named for Magellan. They contain a great number of single stars from the fifth to the eleventh magnitude; many star-clusters, irregular, oval, and globular; and nebulæ. The large cloud occupies a space of 40 square degrees; the small one is only one-fourth as large.

Magellan Jacket. A name given to a watch-coat with a hood, worn in high latitudes, —first used by Cook's people.

Magged. Worn, fretted, and stretched; as, a magged brace.

Magnet. A substance which has the property of attracting iron and some of its ores, and which, when suspended freely, adjusts itself in the plane of the meridian. A *natural magnet* is known by various names in different parts of the world. Pliny called it *ferrum vivum;* the Chinese call it *tchu-chy*, the directing stone; in Swedish it is *segel-sten*, the seeing stone; in Icelandic, *leiderstein*, the leading stone; and in English, *loadstone* or *lodestone* (Sax. *læden*, to lead).

An artificial magnet is one to which polarity has been communicated by artificial means. When a bar remains long in the magnetic meridian its particles acquire the magnetic polarity. On board ship the iron-work often becomes magnetized and affects the local deviation of the compass. Spare compass-cards should be stowed with the north pole of one to the south pole of the other. According to their forms artificial magnets are called *bar-magnets*, *horse-shoe magnets*, *compound magnets*, etc.

Magnetic Axis. The direction of the magnetic polarization of a needle.

Magnetic Equator. A line encircling the earth, on every point of which the dipping-needle remains horizontal,—the line of no dip. It crosses the terrestrial equator in several places, never receding from it more than 12°; the positions of the two nearly coincide in the part of the Pacific where there are no islands, and diverge most when crossing large bodies of land, as Africa and South America.

Magnetic Meridian. The direction which a magnet assumes when suspended freely, and not subject to local attraction or disturbing influences.

Magnetic Needle. A slender bar or plate of magnetized steel.

Magnetic Poles. Two spots, or rather short lines, on the earth's surface where the dipping-needle assumes a position perpendicular to the horizon. See Compass, The Mariner's.

Magnitude of Stars. Astronomers have distinguished the fixed stars according to apparent brightness. The brightest stars, of which there are about 20, are of the first magnitude; stars of second magnitude number about 50; of third magnitude, 200, and so on, the numbers increasing rapidly in the lower classes. The seventh magnitude includes the smallest stars visible to the naked eye. The stars of less than the seventh magnitude are known as *telescopic* stars. The divisions between the magnitudes are not clearly defined, being arbitrary and conventional.

Magnus-hitch. A round turn around a spar, the turn being jammed by a half-hitch around the spar on the opposite side of the standing part.

Magootee. A musical instrument used by the snake-charmers of the East Indies. In it is a mirror, on which the snakes fix their eyes in dancing.

Mahone, Mahonna, or Maon. A Turkish flat-bottomed vessel of burden, mentioned among the ships of Soliman Pasha in the siege of Diu.

Maid. A name of the skate.

Maiden. A fortress which has never been taken.

Maigre. A fish of the family *Sciænidæ*, common in the Mediterranean. It is from 3 to 6 feet long, and so strong that a stroke of its tail will throw a man down. It is one of those fishes which emit a purring or buzzing sound, and has been heard from a depth of 120 feet. It is the *umbrina* of the Romans. The stones of its ears were formerly set in gold and worn around the neck, imaginary virtues being ascribed to them, particularly in the cure of colic; but it was requisite that they should be obtained as a gift, and not by purchase.

Mail-shell. A name for the chiton.

Mailed Cheeks. A family of acanthopterous fishes characterized by an extension of certain sub-orbital bones to the gill-covers to form a bony

armor for the cheeks. To this family belong the gurnards, bull-heads, and sticklebacks.

Main. A continent or mainland. The great sea as distinguished from an arm. The chief part of anything. The distinguishing characteristic of all those articles belonging to, or connected with, the principal mast in a vessel.

MAIN-BOOM. The boom that extends the foot of a boom-mainsail.

MAIN-BRACE The brace attached to the main-yard. (See BRACE.) *Splicing the main-brace*, a figurative expression for drinking spirits.

MAIN-CENTRE. In side-lever engines it is the shaft on which the levers vibrate; in general it is the centre of the heaviest revolving part.

MAIN CHECK-VALVE. An automatic valve connecting the feed-pipe to the boiler, to prevent the water running out of the boiler in case the feed-pipe bursts, etc.

MAIN-COURSE. A square mainsail.

MAIN-DECK. A gun-deck next below the spar-deck.

MAIN-HATCH. The hatch just forward of the mainmast.

MAIN-HOLD. The division of the hold in the vicinity of the main-hatch.

MAIN-LINK. One of the pieces in the parallel motion of a beam-engine, connecting the piston-rod to the beam; the piece connecting the backing and go-ahead eccentric-rods of a steam-engine for reversing motion.

MAINMAST. The principal mast,—the second from the bow. For the rigging of the mainmast, see under proper heads.

MAIN MAST-MAN. A man stationed to attend to the gear of the mainmast. See MAST-MAN.

MAIN-PIECE. The principal piece of the head.

MAIN-ROYAL. See ROYAL.

MAINSAIL. The sail bent to the main-yard. The principal sail of a fore-and-after. For the rigging of the mainsail, see under proper heads.

MAINSAIL HAUL! The order to swing the after yards in tacking.

MAIN-STAY-SAIL. A sail set on the mainstay; it is used only in bad weather, and is generally called the *main storm-stay-sail.*

MAIN STAY-TACKLE. See TRIATIC STAY.

MAIN STORM-STAY-SAIL. See MAIN-STAY-SAIL.

MAIN-TOP. See TOP.

MAIN TOP-BOWLINE. *As long as the main top-bowline*, a sailor's simile for anything of absurd length.

MAIN-TOPGALLANT. See TOPGALLANT.

MAIN-TOPMAST. SEE TOPMAST.

MAIN-TOPSAIL. See TOPSAIL.

MAIN-TOPSAIL HAUL! The order to swing the after yards, in tacking, when the mainsail is not set.

MAIN-TRYSAIL. See TRYSAIL.

MAIN-WALES. An assemblage of planks placed upon the widest part of the body.

MAIN-YARD. The lower yard across the mainmast. For the rigging of the main-yard, see under proper heads.

MAIN-YARDMAN. A man stationed to loose, furl, reef, etc., the mainsail and rig the purchases for swaying up or striking the main-yard,—generally a quartermaster, quarter-gunner, or afterguardsman. The term is also applied to a man on the sick-list.

Make. *To make bad weather*, to roll and pitch violently in a moderate sea,—generally caused by injudicious stowage or negligent steering. *To make fast*, to belay a rope. *To make free with the land*, to approach closely the shore. *Make it so!* the order of the commanding officer to strike the bell when 8 A.M., 12 M., or 8 P.M. is reported. *To make sail*, to clap on additional canvas. *To make the land*, to sight it from a distance coming from seaward. *To make water*, to leak. A ship makes *foul water* when the water is so shallow that her keel stirs up the mud. *To make off*, to cut into pieces the blubber of a whale.

Malafiges. A sailor's name for the goylir, a small sea-bird supposed to precede a storm.

Malaga is situated on a bay of the Mediterranean, in the southern part of Spain, in lat. 36° 43′ 5″ N., lon. 4° 26′ E. The principal manufactures are linen, woolen, and cotton fabrics, sail-cloth, rope, paper, hats, leather, and soap. The harbor is capable of holding a large number of ships, and can be entered during any wind. The exports consist of wines, olive oil, figs, almonds, raisins, grapes, lead, iron, etc. Pop. 95,000.

Malapterurus. A genus of small malacopterygious fishes, possessing a high degree of electrical power (*Malapterurus electricus*). *M. electricus* is found in the Nile.

Malduck. One of the names given to the fulmar, *Procellaria glacialis.*

Male-thread. The thread of a bolt,—that of the nut, or internal thread, being called a female-thread.

Malingerer. One who counterfeits illness for the purpose of avoiding duty.

Mallemak, or Mollymauk. A sea-bird; the *Procellaria glacialis*, called also *fulmar.*

Mallemaroking. The visiting and carousing of seamen in the Greenland ships.

Mallet. A hammer-shaped wooden implement. A *calking-mallet* is used to drive oakum into the seams; its head is long, cylindrical, and hooped with iron. A *serving-mallet* is used as a lever in putting on service, wrapping it more tightly than could be done by hand

Mallotus. A genus of small fishes found along the coast of Greenland; the capelan.

Malström. The most famous whirlpool in the world, off the Norwegian coast, between two of the Loffoden Isles. The current runs 6 hours in one direction and then 6 hours in the opposite way, producing violent whirls. The depth of water is about 20 fathoms, while immediately to the west it is over 100 fathoms. The whirlpool is most violent at the turn of the tide, and if at this time the wind blows against the current the sea becomes extremely dangerous. The stories of ships, whales, etc., being swallowed up in the vortex are mere fables, but there is no doubt that a ship would be in danger of being dashed upon the rocks, and whales have been found stranded on the coast of Flagstadt from the same cause.

Malta. An island in the Mediterranean whose central position makes it important as a commercial depot and of great value as a naval station. It belongs to Great Britain, and is situated 62 miles S.S.W. of Sicily, and 197 miles N. of Africa. Lat. 35° 53′ 48″ N.; lon. 14° 31′ 15″ E. On all sides except the south its coast-line is deeply indented. Its largest bays are those of Mursa and Sirocco on the S.W., and Melleha

and St. Paul's on the N.E.; but the most important in every respect is the double bay formed by the opposite sides of the remarkable peninsula on which the capital, Valetta, stands. Malta is strongly fortified, and is provided with excellent docks. Pop. 150,000.

Maltha. Mineral pitch.

Man. To furnish with a complement of men; as, to man a boat, to man a rope, etc. One of the ship's complement, be he seaman, boy, or marine.

MAN-BOUND. Detained in port in consequence of being short-handed.

MAN-BROKER. A boarding-house master.

MAN-HANDLE. To move by the force of men without the assistance of levers or purchases of any kind.

MAN-HOLE. A hole in a boiler, tank, etc., designed for the entrance of a man, for examination, cleaning, repairs, etc.; it is closed by a piece called a man-hole plate.

MAN-OF-WAR. A national vessel.

MAN-OF-WAR BIRD. See FRIGATE-BIRD.

MAN-OF-WAR FASHION. A neat, orderly, seamanlike manner.

MAN-OF-WAR'S MAN. One of the crew of a man-of-war, as distinguished from a sailor in the merchant marine.

MAN OVERBOARD! The alarm when a person has fallen overboard. See EMERGENCIES AT SEA.

MAN-ROPE. A rope at each side of a ladder as an assistance in getting up and down.

MAN-ROPE KNOT. A knot in the upper end of a man-rope; it is double walled and double crowned.

MAN-TRAP. An open hatch, an insecure ladder, or anything left unguarded and therefore likely to cause an accident to a man.

Manametor. An instrument for measuring the elastic force of gases. A pressure-gauge.

Manarvel. To pilfer small stores.

Manatee, Manati, or Sea-cow (*Manatus Americanus*). A herbivorous aquatic animal of the order *Sirenia*, found in the West Indies and South American rivers. Another species (*Manatus Senegalensis*) inhabits the west coast of Africa.

Manatidæ. A family of *Cetacea*, including all the herbivorous section of the order. They differ from the ordinary *Cetacea* in having swimming-paws rather than pectoral fins. It is supposed that many of the stories of mermaids originated in some of the females being seen with their head and breasts raised out of water.

Manche, or Mangalore. A flat-bottomed boat of burden, about 25 to 35 feet long, 6 or 7 feet broad, and 4 or 5 feet deep, for landing the cargoes of the *patamirs*, which are discharged and loaded at the mouth of the river. These boats are sewed together like the Masulah boats of the Madras. The *Manche of Calicut* is very similar to the foregoing, with the exception of a raking stem for the purpose of taking the beach.

Manchineel. *Hippomane mancinella*, a tree which grows to a vast size on the coasts of the Caribbee Isles, and neighboring continent. The fruit and sap are highly poisonous, but sleeping beneath the branches does not cause death, as was erroneously supposed. See UPAS.

Manganese. A metal resembling cast iron. Equivalent, 27.6; symbol, *Mn;* specific gravity, 8.

Manger. A small space athwart the deck of a ship of war immediately abaft the hawse-holes, and separated on the after part from the rest of the deck by the *manger-board*, a strong coaming rather higher than the hawse-holes, serving to prevent the ingress of the sea when the cables are bent.

Mangrove. The mango-fish.

Manifest. A list of the vessel's cargo, containing the marks and number of each separate package, the names of the shippers and consignees, a specification of the quantity of goods contained in each package, as rum, sugar, etc., and also an account of the freight corresponding with the bills of lading.

Manila, the capital of all the Philippine Islands, situated on the island of Luzon, at the mouth of the river Pasig, in lat. 14° 36′ N., lon. 121° E. Vessels of some hundred tons may come up as far as the bridge. The city is very strongly fortified. A royal marine school, commercial school, barracks, arsenal, and custom-house are among the principal buildings. It is admirably situated for trade, and is the centre to which all the productions of the Philippine Islands flow, and its exports consist of sugar, tobacco, indigo, and manilla hemp, gold-dust, coffee, etc., but it is also widely known for its cigars and cheroots. Pop. about 100,000.

Manilla, or Manila. A fibrous material obtained from the *Musa textilis*, a plant allied to the banana; used for hawsers and running-gear. It is light and flexible, and does not require tarring.

Manly, John, Captain U.S.N. In command of the schooner "Lee," Capt. Manly, acting, it is believed, under the authority of Gen. Washington, in November, 1775, captured the transport "Nancy," loaded with munitions of war and bound to Boston for the use of the British army; thus transferring the ownership and use of the cargo from the British to the American army. The event was announced in a letter from Gen. Washington to Congress of 30th November as one of great importance, furnishing our army with many essential articles of which it had been in great want. While in this command Capt. Manly made other valuable captures. His zeal and enterprise attracted the attention of Congress, and that body, on the 17th April, 1776, appointed him a captain in the navy, and gave him the command of the frigate then building in Massachusetts Bay, afterwards called the "Hancock," of 32 guns. In this frigate, after a severe action of more than an hour, Capt. Manly captured the "Fox," of 28 guns, and ordered her into port, but she was recaptured by the "Flora" of 32 guns. In July, 1777, Capt. Manly, after a chase of more than thirty hours, was captured by the frigate "Rainbow," Sir George Collier, of 40 guns, and the brig "Victor." Capt. Manly displayed great seamanship in his attempt to escape from this greatly superior force, but fortune proved unpropitious in this instance, and the "Hancock" was surrendered. The "Boston," Capt. Hector McNiel, was in company with the "Hancock" when the "Rainbow" was first discovered, but she afforded no assistance. Capt. McNiel was dismissed from the service for his conduct in separating from the "Hancock."

The conduct of Capt. Manly was investigated, but the result left him without reproach. Having been exchanged, he took command of the privateer "Cumberland," and while cruising in her was captured by the frigate "Pomona" and carried into Barbadoes. Being there denied the privilege of parole, he made his escape, and we next find him in command of the privateer "Jason," in which vessel he was, in July, 1779, attacked by two British privateers, one of 18, the other of 16 guns. Reserving his fire, Capt. Manly ran between them, and poured his starboard broadside into one and his larboard broadside into the other, and both struck their colors to him. In September, 1782, Capt. Manly was appointed to the "Hague" (formerly the "Deane"). Cruising in the West Indies he made a wonderful escape from an overwhelming force, the particulars of which are not, however, sufficiently known to be stated with any degree of confidence. An account of his having grounded on a sand-bank near Guadaloupe, and while in that situation having sustained the broadsides of four ships of the line within point-blank shot for three days, has been published, but is probably mythical. The affair, however, gained Capt. Manly much *éclat*, and on his safe return to Boston he was received with distinguished attention by the citizens. He died in Boston in 1793.

Mannheim, on the right bank of the Rhine, between it and the Neckar, in the grand duchy of Baden, is admirably situated for commerce owing to its position on two important navigable rivers and its excellent artificial port. The trade has been very much extended, and it is now the first commercial town of the duchy. The principal articles of trade are tobacco, corn, petroleum, fruits, wine, hops, ironmongery, cattle, etc. Pop. 47,000.

Mantillis. A kind of shield anciently fixed upon the tops of ships as a cover for archers.

Mantissa. The decimal part of a logarithm.

Map. A representation upon a plane of, or a portion of, the surface of the terrestrial or celestial sphere. When the water is the principal subject of consideration, the delineation is known as a chart (which see).

Marabut. A sail which galleys hoisted in bad weather.

Maranhão is a city of Brazil, situated on the island of Maranhão, in lat. 2° 31′ S., lon. 44° 18′ W. On the north and south it is encircled by the small streams São Francisco and Maranhão, at the mouths of which is a basin accessible at high-water to vessels drawing 20 feet. The trade is of great importance, the provinces of Pará, Piauhy, Ceará, Rio Grande do Morte, and Gayaz having here the entrepôt for their produce. The principal exports are rice, cotton, rum, drugs, isinglass, and hides. Pop. 32,000.

Marblehead, a port of entry in Essex County, Mass., on Massachusetts Bay, is situated on a small, uneven, and very rocky peninsula. Its harbor is narrow, deep, and safe, and will admit the largest vessels. Its prosperity is partly derived from commerce and the fisheries, and many vessels are owned by its citizens. Pop. 8000.

Marches. Borders or confines of a country.

Marena. A kind of fish somewhat like a pilchard.

Mare's Tails. A peculiar modification of the cirrus, indicating wind. They consist of wisps, fibres, and streaks.

Margot. A fish of the perch kind, found in the waters of Carolina.

Marinarus. An old term for a sea-faring man.

Marinate. To salt fish and afterwards preserve it in oil or vinegar.

Marine. Pertaining to the sea. A sea-soldier. *Dead marine*, an empty bottle.

Marine Barometer. A barometer adapted for use at sea, the tube being contracted to avoid sudden oscillations in consequence of the rolling of a vessel.

Marine Glue. See Glue, Marine.

Marine Governor. A governor for marine engines, intended to counteract the effect of the ship's motion on the engine, and prevent racing. See Governor.

Marine Officer. An officer of the marine corps (which see).

Marine Corps. Soldiers enlisted for service either on shore or on board of ships of war are known by the distinctive name of *Marines*. In nearly all maritime countries, claiming to be war powers, they constitute a separate military body, trained to fight either as infantrymen or artillerists, and especially for participation in naval engagements. They are organized, clothed, and equipped very much as soldiers of the land forces, and their preliminary instruction is usually the same. For these reasons they become qualified for duty with either the army or navy, and therefore are of double value to the nation which employs them. Their headquarters, barracks, and depots are on shore, and from them details are made when required for service on shipboard. These detachments vary in size with the ship, from a dozen men under a sergeant to a hundred under one or more commissioned officers, and are all called "marine guards."

The marine guard of a man-of-war has been aptly described by one writer as "its backbone," and by another as "the bulwark between the cabin and the forecastle." To fully appreciate the force of the latter comparison one needs to bear in mind that all nations contribute quotas to the vast throng which follows the sea, and that in the larger vessels are often found motley crews containing elements exceedingly heterogeneous and reckless, sometimes desperate, and always with capacities for mischief highly cultivated. The muster-roll of the U. S. steamer "Shenandoah," a ship of medium size, serving in the European Squadron, 1873, at one time exhibited 21 nationalities, some scarcely half-civilized. In the frigates and large ironclads the proportion of officers to crew is as 1 to 12, and sometimes as 1 to 18, and the result of a mutinous conflict with such odds, and without any interposition or assistance, could hardly fail to be most lamentable. Unfortunately, such things have happened in the past, but "the bulwark," although severely tested, has seldom been found wanting. The support afforded by "a steady column of bayonets," remarked Rear-Admiral Chas. Stewart, "has made mutinies scarce." His successor, as the senior officer of the American navy, Admiral Farragut, "always deemed the marine guard one of the great essentials of a man-of-war;" and the distinguished and accomplished Admiral Wilkes wrote: "The marines constitute the great

(I had almost said the only) difference between a man-of-war and a privateer." Commodore Perry, also of world-wide fame, said: "Marines on board of ships of war are not only necessary to the proper preservation of discipline, but are useful in the ordinary duties of the vessel;" and the gallant and impetuous Porter (present admiral of the navy) declared: "If the marines are abolished, half the efficiency of the navy will be destroyed. They are as necessary to the well-being of a ship as the officers." Long before them the immortal Nelson was wont to remark that when he became first lord of the admiralty "every fleet should have a perfect battalion of marines," and the Earl of St. Vincent, another famous English admiral, urged upon his countrymen that "without a large body of marines we shall be long, very long, before an efficient fleet can be sent to sea."

The origin of the marine service is of very great antiquity. Capt. Luce, of the U. S. Navy, in a most interesting chapter written for "The History of the U. S. Marine Corps," prepared by Capt. R. S. Collum, U.S.M.C., and M. Almy Aldrich, Esq. (Boston, 1875), recites that the employment of marines as a part of the regular complement of vessels of war was common to the Phœnicians and to all of the maritime states of Greece at least five centuries before the Christian era. Prior to that time the warriors were the oarsmen; but as naval science progressed and the size of vessels increased, there gradually sprang up two distinct classes, which together made up the *personnel* of the navies about 500 B.C. These were the rowers, or seamen proper, who had the management of the vessel, oars, and sails, and the marines or fighting men. Marines are specially mentioned in the accounts of the battle of Lâdé, in the time of Darius, king of Persia, about 497 B.C. In this battle between the Greeks and Persians, over 100 Greek ships had each "forty armed citizens on board, and those picked men." The Persians also carried soldiers in their vessels. To the Greek soldiers was given the name *epibatæ*, a term which all authorities agree in rendering into English by the word *marines*.

The largest number of these men found on board of the regular war-ships at this period was 40. Plutarch says that at Salamis each Greek trireme carried 18. Thucydides makes frequent mention of them in his writings, and Boeckh remarks that even in those ancient times these *epibatæ* were a corps entirely distinct from the land soldiers and belonged to the vessels. They had, moreover, their own officers, called *trierarchoi*. During the naval supremacy of Rome, the larger vessels carried 300 rowers and 120 marines (*classiarii milites*), and in fighting, the latter "used arrows and darts at a distance, spears and swords in close combat, and as vessels increased in size they added the *balistæ* and *turres* (turrets), and fought from them as from castles on land."

In the early history of the English navy we read of men-at-arms still serving afloat, their armor and weapons differing but little from those of the ancients. The Scandinavians called them *bat-karler*, or sea-soldiers, that is, carls or sturdy fellows who fought in boats. Later, they were called *supra-salientes*, a word still preserved in the Spanish *sobiesaliente*, a military term which literally means "surpassing, excellent." It is recorded that Genoese cross-bowmen, the best marines of the period, were in the 13th century employed and very highly esteemed in the English ships, and that in August, 1387, Sir Henry Percy ("Gunpowder Percy") was appointed captain of all the men-at-arms and archers of the fleet. He was, in fact, commandant of marines.

The introduction and gradual increase of naval ordnance caused the occupation of men-at-arms afloat to become auxiliary instead of principal, and the employment of marines in their present form seems to date from 1653, when Admiral Blake embarked a number of soldiers to act as small-armsmen in the battle with Von Tromp, off Portland. The famous corps of marines of Great Britain was originally instituted in 1664. Beaude states that in 1684 mention is made of the Duke of York's "maritime regiment of foot," and that during the reign of William III. several regiments of foot were placed on the marine establishment, but subsequently disbanded. In the beginning of the reign of Queen Anne "six regiments of maritime soldiers" were raised, and these also were disbanded in 1749. The necessity for this kind of troops was so pressing, however, that six years later 130 companies, numbering above 5000 men, were raised upon the recommendation of the great English admiral, Lord Anson, and it is recorded that, in 1760, this force had grown to 18,000. We are also informed that in 1740 three regiments of marines were raised in America, and assembled at New York. All of the officers, except the captains of companies, who were colonists, nominated by the provinces, were appointed by the crown, and Col. Spotiswood, of Virginia, was made colonel commandant of the whole. This is a grade superior to colonel, and seems to be peculiar to the marine service.

Nicolas, in his history of the royal marine forces, pays handsome tribute to their valor and gallantry in many a hard-fought action, and Capt. Luce adds that on no occasion did they prove themselves of more value to their country and to the navy to which they belonged, or reflect more honor on their corps, "than during the momentous period covering the great mutinies at Spithead, the Nore, and Bantry Bay."

This inestimable quality of the marine—fidelity—no doubt arises from that want of sympathy with the sailor which his military training, habits, and *esprit de corps* create. In concluding his chapter, Capt. Luce says that the "United States marine corps has well sustained the high reputation for steadfast courage and loyalty which has been handed down to it from the days of Themistocles," and, might have added, wears with pardonable pride and jealous care the title of "*Ever faithful.*"

We come now to the genesis of this particular corps, which antedates the organization of the regular navy and the Declaration of Independence. November 10, 1775, the Continental Congress, to promote the "publick defense," cautiously

"*Resolved*, That two battalions of marines be raised, consisting of one colonel, two lieutenant-colonels, two majors, and other officers, as usual in other regiments; that they consist of an equal number of privates with other battalions; that particular care be taken that no persons be appointed to offices, or enlisted into said battalions, but such as are good seamen, or so acquainted with maritime affairs as to be able to serve to advantage by sea when required; that they be enlisted and commissioned to serve for and during the present war between Great Britain and the colonies, unless dismissed by order of

Congress; that they be distinguished by the names of the First and Second Battalions of American Marines."

This was the first step taken toward the creation of the naval establishment which has won such imperishable fame for the United States, and upon it is based the claim of the marine corps to be "the oldest in the service." Aldrich says that "before a single vessel of the navy went to sea the corps was organized," and, further, that a detachment of it gained on the island of New Providence, one of the Bahamas, early in 1777, "the first fight in the history of the regular navy." In this noteworthy engagement the attacking party, consisting of 300 marines and landsmen under Major Nichols, captured the forts and other defenses of the enemy after a struggle of a few hours, and secured a quantity of stores and British cannon. The marines belonged to the fleet of Commodore Hopkins, who was operating against Lord Dunmore.

During the following years of the Revolution they were found at work proving their patriotism and devotion to the cause which gave them being; and, in fact, throughout their entire existence they have been, as will be seen, in the front rank of the Republic's defenders, zealous participants, *per mare et terram*, in nearly every expedition and action of moment in which the navy has been engaged; and in many trying campaigns with their brethren of the army have won distinction for themselves and honor for their country. The globe (which is one of the emblems of the corps device) has been their stage, and every zone has heard their watch-cry, "All's well!"

The patient labors of Capt. Collum have put many of their deeds of record, so that one can now follow them with little effort. Conspicuous among these is their part under John Paul Jones, in the action between the "Ranger" and the "Drake," in which Lieut. Wallingford, of the marines, lost his life at the head of his men; again, in the great battle between the "Bon Homme Richard" and the "Serapis," in which they numbered 120 rank and file, led by Lieut.-Colonel Stack and two lieutenants; in the fight between the frigate "Philadelphia" and the Tripolitans, where, "after most gallant exertions," Lieut. Osborne and his guard were made prisoners; in the attack on the Tripolitan gunboats, August 3, 1803, in the course of which Lieut. Trippe, engaged in a hand-to-hand fight with a Turk, was saved by a sergeant, who "passed a bayonet through the body of the Turk"; in the remarkable march of Gen. Eaton from Alexandria to Derne, nearly 600 miles through Northern Africa, where a small detachment of marines under the brave Lieut. O'Bannon, mounted on camels and asses in the caravan, leavened the lump of Arabs and Greeks in the service of the United States, and in the attack on Derne stormed the principal work, took possession of the battery, planted the American flag *for the first time on a fortress in the Old World*, and turned its guns upon the enemy. Thereafter "Tripoli" was engrossed on the banners of the marine corps.

During the war of 1812 they were exceedingly active at sea and on shore. In the glorious victory of the "Constitution" over the "Guerriere," the first officer killed was Lieut. Bush, who commanded the marine guard, and with his junior, Lieut. Contee, was assisting in repelling boarders "at a critical moment of the engagement"; in the victory of the "United States" over the "Macedonian," Lieuts. Anderson and Edwards fought the marines "with the utmost steadiness"; in the brilliant operations of the "Essex" in the Pacific Ocean, Lieut. Gamble gained great reputation for "skill and efficiency," commanding in turn his guard, a prize-ship, and a fort at Nuka Hiva, in the Marquesas Islands; in the bloody battle between the "Shannon" and the "Chesapeake," Lieut. Broom and 11 of his men were killed and 20 wounded; in the ever memorable battle of Lake Erie, Lieut. Brooks, of the "Lawrence," was killed, and 18 marines of the fleet placed *hors de combat;* in the battle of Lake Champlain the marines suffered severely; when the frigate "Constitution" captured the corvettes "Cyane" and "Levant," Capt. Henderson was "specially mentioned"; in the struggle between the "President" and the "Endymion," Lieut. Twiggs "particularly distinguished himself"; and in the fight on Lake Ponchartrain, the senior marine officer was killed, making four-elevenths of the officers of the corps who were slain in that war.

On shore, they were with the army under Scott (then colonel) in Canada; with Gen. Winder at Bladensburg, where, after the militia ingloriously fled, they, with Commodore Barney's sailors, "kept the whole British force at bay until there was scarcely a man on our side who was not killed or wounded," Capt. Sevier wounded and Capt. Miller (afterwards lieutenant-colonel) wounded and a prisoner; with Gen. Jackson at New Orleans, where Maj. Carmick was wounded; at North Point, Baltimore, where the British were driven off; and in sundry affairs on the coast of Maine and shores of Chesapeake and Delaware Bays. Near Norfolk, "Lieut. Breckenridge, with 150 marines, assisted in preventing the enemy's boats from ascending James River."

In the interval between 1815 and the Florida war (1836–37) they were called upon, among other things, to quell a serious revolt in the Massachusetts State prison, which was done; to act against Spanish pirates in the West Indies and Malays in Sumatra; and to guard public and private property at the time of the great fire in New York (1835), for which they received a vote of thanks from that city. When Indian hostilities broke out in Georgia in 1836, the disposable force of the army being found inadequate, Col. Comdt. Henderson promptly volunteered his services and those of the corps serving on shore. They were accepted, and their places at the navy-yards temporarily filled by watchmen from civil life. Two battalions proceeded to Charleston from rendezvous at New York and Fortress Monroe, and thence went to Fort Mitchell, Ala., where they were consolidated into a regiment and sent to Tampa Bay *via* Apalachicola. In the everglades they shared the arduous campaigns of Gen. Jesup against the treacherous Creeks and Seminoles, "bearing an honorable and important part at Hatchee-Lustee" (January 22, 1837), and in other actions. Besides these, two companies (130 men) served in the Mosquito Fleet on the west coast, co-operating. Their combined losses were 48 men, killed or died.

From 1846–48 the corps was engaged in the

war with Mexico, where it figured in every quarter, and made a most excellent record. Several detachments were on the Pacific side with Commodores Sloat, Shubrick, and Stockton; others in the squadron on the east coast under Commodores Connor and Perry, and at times with the army under Gens. Scott, Taylor, and Worth. They were present at the capture of Monterey, San Francisco, and Mazatlan; fought at Los Angeles, San Diego, San Gabriel, San José, and Guaymas, and with such credit that Commodore Shubrick recommended the government to double the guards of all vessels coming to the station, reducing, if necessary for the purpose, the complements of ordinary seamen and landsmen. On the east coast they were engaged in the capture of Matamoras, Tampico, Frontera, Tabasco, and Vera Cruz. The first battalion, which came from Fort Hamilton, New York harbor, joined the main army at Puebla in June, 1847, and being assigned to Gen. Quitman's division, in which Lieut.-Col. Watson, of the marines, commanded the second brigade, participated in all of the brilliant operations which marked the march to the city of Mexico, where it was with the first portion to enter the Grand Plaza, and was specially detailed to clear the ancient palace of intruders and protect it from spoliation, a fact which completes the explanation of the inscription since found on the corps banners: "From Tripoli to the Halls of the Montezumas."

The crowning honor, however, was at Chapultepec, September 13, where the party assigned to the storming of the castle—120 men, "selected from all corps"—was led by Maj. Levi Twiggs, and the pioneers, equipped with ladders, pick-axes, and crows, by Capt. John G. Reynolds, both of the marine corps. Gen. Quitman, in his official report, dated National Palace, Mexico, September 29, says: "The storming-parties led by the gallant officers, who had volunteered for this desperate service, rushed forward like a resistless tide. For a short time the contest was hand-to-hand; swords and bayonets were crossed and rifles clubbed. Resistance, however, was vain against the desperate valor of our brave troops." The gallant and lamented Twiggs fell on the first advance at the head of his command, and Lieut.-Col. Watson died in Vera Cruz two months later. In March, 1848, a second battalion of four companies of 90 men each, commanded by Maj. John Harris, sailed from New York to co-operate with the squadron on the Isthmus of Tehuantepec; but on their arrival at Vera Cruz the war was virtually over, and they were ordered to garrison Alvarado.

A few years later (1852–53) some of these Mexican heroes were marching to the same music through the streets of Yeddo, the capital of Japan, as a part of the celebrated expedition of Commodore Perry. Brevet Maj. Zeilin was the second person to land, and "the presence of these trained American soldiers contributed in no small degree to the speedy success achieved." In 1856 we find a detachment from the "Decatur" fighting Indians at Seattle, Washington Territory, and another from the "San Jacinto," "Portsmouth," and "Levant," attacking the Chinese and demolishing the Barrier Forts of Canton.

During the Know-Nothing political excitement of 1857 they were ordered out by the President, upon request of the mayor of Washington, to suppress an armed mob of "Plug-Uglies" from Baltimore who had overawed the police. These miscreants hooted and defied the marines, and showered stones and pistol-shots, but a well-directed volley caused them to disperse and seek shelter.

In 1858, 40 marines and sailors from the "Vandalia" had a fierce conflict in the Fiji Islands with a body of 300 naked warriors who had killed two American merchants. The natives were punished, and the Secretary of the Navy pronounced the conduct of the officers and men as "in the highest degree commendable." The same year a detachment from the Brazil Squadron was landed in Montevideo, upon application of the governor, to protect the lives and property of the foreign residents from domestic violence. Brevet Maj. Reynolds commanded, and they remained until the revolutionists capitulated. In the Paraguay Expedition there were 8 marine officers and the usual complements of men. At home, in August, when the enraged citizens of Staten Island burned part of the quarantine buildings through fear of yellow fever, 65 marines were sent from Brooklyn to protect those remaining "at all hazards," and did, although the rioters, fully armed, made further attempts at arson.

October 17, 1859, the United States were convulsed by news of the John Brown insurrection at Harper's Ferry. The President ordered Col. Comdt. Harris to send forward the available force at headquarters by special train, and 100 men, with a battery of Dahlgren howitzers, were at the railroad depot in one hour. They were met by the Secretaries of War and the Navy, who gave Lieut. Greene, commanding, his instructions. Upon arrival they found the militia held in check by the insurgents, who had been driven into an engine-house. Under the orders of Col. Robert E. Lee, then in the U. S. army, the marines assailed the barricaded engine-house, using a long ladder as a battering-ram, and, after killing two of the band and mortally wounding another, captured the "remarkable old man" and the remainder of his followers. Scouting-parties sent into the country captured 1500 pikes. One marine was mortally and another slightly wounded.

In March following, 50 marines and sailors from the "Marion" were instrumental in saving from destruction the property of the American residents of Kisembo, on the west coast of Africa, and on the 27th of September another party was landed from the sloop "St. Mary's," at Panama, to protect the Isthmus railroad. On the 28th the governor delivered up the city to the joint occupation of the men of the "St. Mary's" and of the British ship "Clio." Since then Panama and the railroad have been repeatedly guarded by our marines and sailors.

The Great Rebellion (1861–65) made the next special demand upon the services of the marine corps, and they were rendered "nobly and well" afloat (Alden), and "admirably in camp and field" (Dahlgren). In the beginning, when the defections from the army and navy occurred, the marine corps, being largely composed of Southern men, lost its full share of officers. There

were in all 6 resignations and 14 dismissals (those who tendered their resignations after May 1, 1861, being summarily dismissed). The last to leave was First Lieut. A. W. Stark, January 9, 1862. These vacancies were rapidly filled by loyal men, and July 25, Congress authorized a large increase to be made by the appointment of candidates between 20 and 25 years of age, which caused 50 of the 60 lieutenants to be young and inexperienced.

The first duty to which it was called was on January 7, when 250 artillery and marines left New York during the night on the steamer "Star of the West" to reinforce the beleaguered garrison of Fort Sumter.

During the same month Lieut. Hebb (now lieutenant-colonel) was sent with a detachment to garrison Fort Washington on the Potomac, near the capital, and on the 22d the force at the Brooklyn barracks was put under arms to repel a rumored assault by rebel sympathizers on the navy-yard. April 12, Lieut. Cash (since major), with the guard of the frigate "Sabine," reinforced Fort Pickens, Fla., and on the 20th, the garrison at Norfolk, and the guards of the "Pennsylvania," "Cumberland," and "Pawnee," acting under orders, destroyed the navy-yard and ships at that place, spiking the heavy guns and breaking up thousands of small-arms. "At midnight, when the moon sank, the barracks near the centre of the yard were set on fire, that by the illumination the work might be continued."

In the first battle of Bull Run, or Manassas, a battalion of 350 officers and men, mostly recruits, commanded by Major Reynolds, served in Porter's brigade as the support of Griffin's battery. Lieut. Hitchcock and 8 men were killed, 2 officers and 17 men wounded, and 16 missing. At the capture of Hatteras Inlet, in August, the marines of the "Minnesota," "Wabash," and "Cumberland," under Capt. Shuttleworth (afterwards colonel), landed with the troops of Gen. Butler in surf-boats and entered Fort Clarke. When the Confederate privateer "Judah" was destroyed at Pensacola by a boat expedition at night, in September, the first to board was a private of marines, who, by a mistake, having lost his distinguishing mark, was subsequently killed by one of his own party. In the Dupont Expedition and battle of Port Royal they took a prominent part, and after the victory occupied the captured forts until relieved by the army. A separate battalion, Major Reynolds (afterwards lieutenant-colonel), accompanied the armada in a transport called the "Governor," which was wrecked at sea, but the troops were luckily rescued by the "Sabine," with a loss of 7 men. In nearly all of the expeditions and actions which followed, along the coasts and up the rivers of South Carolina, Georgia, and Florida, the marines shared as sharpshooters, skirmishers, or artillerists, leading advances, covering retreats, building batteries, repelling torpedo-boats, or garrisoning captured towns. The mayor, city council, and citizens of St. Augustine paid "the urbanity of the officers and good conduct and discipline of the troops" exalted compliment, and begged that they might remain.

In the celebrated "Trent affair" 8 marines from the "San Jacinto" bore a very dramatic part, subduing the defiant and insulting attitude of the passengers and crew while the Confederate commissioners were being removed from the ship. The first shot from the ironclad "Merrimac" killed 9 marines on the "Cumberland," and in the hopeless resistance made by the "Congress" their faithful blood crimsoned the decks. In this most famous of modern naval battles the marines of the "Minnesota," "Roanoke," and "St. Lawrence" were also engaged, and "justly won the praise of the officers under whom they acted and of the whole of the loyal nation" (Aldrich). At Roanoke Island, off Wilmington, in the operations in the sounds of North Carolina, and in the James and Potomac Rivers, they also assisted, and were on the blockade of all the principal ports, suffering a heavy loss when the fleet off Charleston was raided by 2 rebel ironclads from within in 1863. One hundred and fifty men, Capt. Kintzing (now colonel), guarded the naval stations at Cairo and Mound City, Ill.; 30 were on the flag-ship "Black Hawk" in the Red River Expedition, and a thousand more could have been advantageously employed in the Mississippi Squadron, but they could not be spared. Ten thousand marines were really needed for this war, but the opportunity, like many others, was allowed to pass unimproved. The Marine Brigade, a kind of substitute, which operated in steam-rams and transports on the Western rivers, was a volunteer organization, and had no connection with the marine corps.

On the lower Mississippi, and in the terrible tumult at the passage of the forts, "they more than maintained their reputation" (Admiral Boggs). The honor of perfecting the conquest of New Orleans, of hoisting the stars and stripes, and holding that excited and turbulent city until the arrival of the army under Gen. Butler (May 1), fell to a battalion of 250 marines of Farragut's fleet, under Capt. J. L. Broome. June 28, in passing the batteries at Vicksburg, the guard of the "Hartford" fought the broadside-guns, and the following March, at Port Hudson, the guards of the "Hartford," "Richmond," "Mississippi," and "Monongahela" were badly cut up. Capt. Ramsay, in command of the marine division of the "Richmond," had *nearly a whole gun's crew swept away by a single shot.*

December 7, 1862, 2 companies, Major Garland, going to California *via* Panama, on the mail-steamer "Ariel," were captured by Semmes off the coast of Cuba. A rebel lieutenant addressed the command and offered every inducement to get 20 volunteers for the marine guard of the "Alabama," but not a man proved recreant to his trust. They were paroled, and proceeded on their journey. During July, 1863, the "Draft Riots" provided duty for a battalion at home, which won "marked approbation" in New York, quelling the disturbances and guarding the public property. In August, a second battalion, Major Zeilin, was sent from New York to the South Atlantic Squadron to co-operate in the attack on Charleston, and to relieve the marines of the ships who had helped to erect the naval battery. It was encamped on Morris Island, and, September 8, furnished 6 officers and 100 men, all volunteers, under Capt. McCawley, to engage in the combined night attack on Fort Sumter, in which Lieut. Bradford was mortally wounded, Lieut. Meade captured, and

30 men killed, wounded, or missing. Ten officers and 104 men of all corps were taken prisoners.

When the career of the "Alabama" was so abruptly ended by the "Kearsarge," off the coast of France, it was fitting that the marines should begin the fight on our part, which they did from a rifle-gun on the forecastle, "firing rapidly and effectively throughout, and nobly sustained the high repute of their service" (Thornton). The same year, on board of the "Wyoming," they were fighting the Japanese in their forts at Simonosaki, where private Furlong was killed and another wounded. At Mobile, "one of the fiercest naval combats on record" (Farragut), "the marines performed most efficient service" (Drayton). And the medals of honor received by them for this action and the previous battles on the Mississippi made a long list. About this time, Capt. Heywood, the senior marine officer (aged 25), could muster nearly 800 marines in the fleet of Admiral Farragut.

A notable illustration of their usefulness in emergency occurred in this year. The steam-frigate "Wabash," returning North in October to get a new crew, went ashore on the outer edge of Frying-Pan Shoals. She was short-handed, and manned principally by negroes, landsmen, and boys. Finding it impossible to get a kedge-anchor out otherwise, Capt. De Camp called on the marines, under Lieut. Fagan, who responded with alacrity, filed into the boat, took the oars, placed the anchor, and when the tide rose the noble ship floated and was hauled off safe. In after-years, Capt. De Camp (since rear-admiral) told the writer that "the 'Wabash' owed her life to Fagan's marines." Thirteen years previously, in the East Indies, Lieut. Broome ran a bower-anchor from the sloop "Marion," which was ashore in the breakers of Formosa. She got off, and he was thanked on the quarter-deck by Commander William Glendy.

In November, 1864, two batteries of naval howitzers and nine companies of marines and sailors, under Commander Preble, ascended Broad River, S. C., to co-operate with Gen. Foster in establishing connection with Gen. Sherman, who was coming to the sea. On the 30th they were repulsed at Boyd's Neck; but on the 6th of December made a successful attack at Tulifinny Cross-roads. Killed and wounded, 21. First Lieut. George G. Stoddard commanded the marines, who numbered about 300. When Charleston was abandoned, Lieut. Stoddard occupied Georgetown, S. C., with six companies of marines, and Lieut. Breese, with one company, held the battery of 15 guns. Seven companies, with only two first lieutenants to officer them, recalls the fact that a Federal brigade at Pensacola, with a general, colonels, majors, etc., contained fewer men than Capt. Heywood had in the marine battalion of the fleet.

Among the last and most momentous events of this war were the two attacks on Fort Fisher. About 60 vessels constituted the fleet, and many of them, being heavy steamers, carried large guards. Lieut. Pile, of the "Juniata," was killed in the first attack, and over 50 enlisted men were either killed or wounded in the second, where 1400 marines and sailors constituted an assaulting column. While the conduct of the marines, as a body, in this terrific struggle has been the subject of more discussion than in any other enterprise that they were ever engaged in, there can be no doubt of the individual gallantry of officers and men, many of whom were specially commended and rewarded for conspicuous service. The unfortunate failure to organize the different marine detachments thrown together on the beach leaves a blot and teaches a lesson which, like the story of the "Chesapeake" and the "Leopard," should never be forgotten, and which it would not be honest to ignore in view of the deluge of praise and thanks of Congress which they received elsewhere in this great war.

The government having determined to bring the industrious Raphael Semmes to trial for his depredations on the high seas, Lieut. French was sent with two sergeants in December, 1865, to arrest and deliver him in Washington. After visiting Memphis, Vicksburg, and New Orleans, he was found in Mobile and brought to the capital, where he remained a close prisoner at the marine barracks until April, when he was released without trial and restored to his parole.

When Portland, Me., was devastated by fire, July 4, 1866, as is usual in times of public distress or excitement, the evil-disposed from other cities gathered for plunder. The authorities telegraphed to Portsmouth Navy-Yard for marines, and in a few hours Lieut.-Col. Jones arrived with two companies. Lines of sentinels were posted in the burned district, many persons arrested, and quiet restored. From 1867 to 1871 the illicit distillation of whisky, upon which there was a high tax, gave great trouble to the revenue officials, and they frequently met with such fierce resistance that it became necessary to call on the marine garrisons of Philadelphia and Brooklyn for assistance. This was given, but proved to be a most delicate and dangerous duty, more unwelcome than actual war. Violent mobs armed with revolvers, stones, and bricks had to be encountered and overcome, and murderous missiles from housetops were frequent incidents. Lieut.-Col. Broome had the largest share of this disagreeable work to do, and received the approval of the government for himself and command.

An unsuccessful attempt, in 1867, to punish some savages on the island of Formosa, who had murdered the crew of the American ship "Rover," was shared in by 43 marines from the "Hartford" and "Wyoming," under Capt. Forney. Better success attended a boat expedition from the "Mohican," in June, 1870, which captured and burned in a Mexican river, near Mazatlan, the piratical steamer "Forward." First Sergeant Moore and a corporal received "special notice." In 1871 a very serious fight occurred in Corea, in which 4 officers and 105 marines from the "Colorado," "Alaska," and "Benicia," under Capt. Tilton, fleet marine officer, formed portion of a landing-party of 680 men. They advanced through a strange and rough country, the marines leading, and stormed a citadel upon a hill 150 feet high; overcame a garrison of several thousand men, killing 243; captured 50 flags and 481 pieces of ordnance, besides many match-locks and gingalls. Commander Kimberly, U.S.N., gave the marines full honor as the advance-guard, and Lieut.-Commander Casey reported that "their conduct excited the admiration of all."

July 13, 1869, Lieut. Breese was ordered from the marine barracks, Brooklyn, to report to Gen. Barlow, U. S. Marshal, to aid in preventing a violation of the neutrality laws. He proceeded in the revenue-cutter "Mahoning" to Gardiner's Island, at the east end of Long Island, where, on the 16th, with a company of 50 marines, he surrounded a camp of Cuban filibusters and captured 125 of them. The prisoners were sent on board of the "Mahoning" and carried to New York, where the expedition arrived next day.

The great fires in Boston, November 9, 1872, and May 30, 1873, called them out again, and enabled them to render very valuable service to the city and United States authorities. Capt. Collum, who commanded on each occasion, obtained for himself and men "most complimentary recognition." A month later, at Callao, Peru, Capt. Pope received the thanks of the Italian government for services rendered on the occasion of a fire on a vessel belonging to that nation.

The war-cloud which arose after the "Virginius" massacre caused a great fleet to gather at Key West, in 1874, to menace Cuba, and the opportunity was improved by landing 650 marines, who were found in excellent condition for active service. In 1877, the terrible and unprecedented labor riots, which paralyzed business in nine States, and led to wholesale arson and murder, culminating in Pittsburgh, called all of the available regular forces into the field. Marines were taken from ships and barracks; a battalion was sent to Baltimore, another to Philadelphia and Reading, and companies to garrison the U. S. arsenals at Watervliet, Frankford, and Washington, D. C., all coming under the command of Maj.-Gen. W. S. Hancock (see "United Service" magazine, Philadelphia, 1879). They encamped in depots, patrolled streets, dispersed angry mobs, arrested the destruction of property, escorted railroad trains into the interior (riding on the locomotives), and guarded public and private interests with such zeal, that Gen. Hancock, in returning them to their stations, wrote: "Citizens and soldiers are united in admiration of the soldierly bearing, excellent discipline, and devotion to duty displayed by them," and inclosed a report of an official inspection made at Reading by the venerable Col. Cuyler, of his staff, who said: "I do not recollect ever having seen a more soldierly or a more orderly set of men." The Secretary of the Navy reviewed them in Washington before they were dismissed, and in orders recognized the readiness with which they responded to the summons of the Department, and their proficiency in discipline, and pronounced them "a most important arm of the national defense, confidently to be relied upon whenever the public exigency shall call them into active service."

Their latest conspicuous special service was in France, where a picked company, sent out in the honored old frigate "Constitution," was stationed during the Universal Exposition of 1878, under Lieuts. Russell and Zeilin. They had charge of the American department, and the Hon. R. C. McCormick, Commissioner-General for the United States, reported to the Navy Department that "their excellent conduct, both on and off duty, were spoken of in the most complimentary terms by the French authorities, by the citizens of Paris, and the visitors to the Exposition," and at the ceremonies attending the distribution of prizes in October, their military bearing elicited "a grand outburst of enthusiasm, and they throughout reflected honor upon our flag by their admirable performance of an important duty in a foreign land."

This incomplete outline of the principal public services of the marine corps for 105 years exhibits an infinite variety, and gives some idea of the great utility and mobility of "web-footed soldiers." These qualities have helped to secure for them the highest commendations of the most famous naval commanders of every age, and when, in 1866, a proposition was made to abolish the marine corps as such and transfer it to the army, Congress was overwhelmed with the recorded views of such old heroes as Hull, Decatur, Bainbridge, Biddle, Parker, Perry, Morris, Stockton, Shubrick, and Tattnall, and of later days, Farragut, Porter, Rowan, Stringham, Paulding, Dupont, Sands, Rodgers, Foote, Davis, Worden, and Dahlgren,—a mighty list, which might be much further extended. As a result, the House Committee on Naval Affairs, charged with the resolution, not only reported adversely, but went so far as to say: "From the beginning this corps seems to have satisfactorily fulfilled the purposes of its organization, and no good reason appears either for abolishing it or transferring it to the army; on the contrary, the committee recommend that its organization as a separate corps be preserved and strengthened, and that its commandant shall have the rank of brigadier-general."* March 2, 1867, that grade was established, and continued until 1874, when selfish motives secured its abolition.

The marines, as an institution, certainly can make no serious complaint of lack of appreciation. Congress has *nineteen times*, by joint resolution, tendered its thanks to them, or expressed its high sense of their valor and good conduct, and the greatest generals have added their tributes to those of the naval commanders. Napoleon Bonaparte, when reviewing the marines of the "Bellerophon," exclaimed: "What might not be done with a hundred thousand such men!" Winfield Scott, in Mexico, said of our own, that he "put them where the heaviest work was to be accomplished, and had never found his confidence misplaced;" and Gen. Grant, on the quarter-deck of the "Vandalia," while crossing the Mediterranean, remarked that they were "as fine soldiers as he ever had seen."

Legislation affecting the marine corps has been abundant, and generally liberal. So long ago as January 8, 1780, Congress provided that "the marines of the navy of the United States whilst doing garrison duty be allowed the same subsistence moneys as the line of the army." At the close of the Revolutionary war, the poverty of the Confederation caused the battalions to be disbanded, and in 1787 there is record of a "commissioner of marine accounts" settling up the business of "the late navy of the United States." In 1794, the cupidity of Algerine corsairs compelled "the late navy" to be revived for the protection of commerce, and the President was

* He was then a colonel commandant, with a colonel, 98 other officers, and about 3600 rank and file under his orders, —the equivalent of two strong brigades.

authorized to provide for ships of 44 guns "one lieutenant, one sergeant, two corporals, one drum, one fife and fifty marines," and for those of 36 guns the same less 10. In 1797, when the frigates "United States," 44, "Constitution," 44, and "Constellation," 38, were ordered to be "manned and employed," the guards were increased, viz.: "two lieutenants, three sergeants, three corporals, one drum, one fife, and fifty marines" each to those of 44 guns, and "one lieutenant, two sergeants, two corporals, one drum, one fife, and forty marines" to those of 36. This was to last "a year and thence to the end of the then next session of Congress and no longer;" but by that time the act of July 11, 1798, was passed providing, "in addition to the present military establishment, a corps of marines, which shall consist of [see table of strength below], including the men who have already been enlisted or authorized to be raised for the naval armament."

The said corps was to be formed into as many companies as the President might direct, to be in lieu of the respective quotas which had been already established for the frigates and other armed vessels and galleys in the service. The pay and subsistence of officers were fixed, the highest rate being $50 per month and four rations per day, and that of the enlisted men "conformably to the act entitled an act providing a naval armament." The President was authorized to continue the enlistment of men to serve for three years; to appoint officers when vacancies occurred; to detach and appoint such of the officers as he might judge necessary to act on board of the armed vessels; to assign this corps, or any part of it, to duty in the forts and garrisons of the United States on the sea-coast, or to any other duty on shore, and when so serving the commandant was given power to appoint an adjutant, paymaster, and quartermaster, and non-commissioned staff-officers from the line, who were to have extra pay and allowances. All the members of the corps were to take the same oaths and be governed by the same rules and articles of war as may be prescribed for the military establishment (see OATHS), and by the rules and regulations for the navy according to the nature of the service in which employed; and in case of wounds or disabilities, were to receive the same allowances according to rank as are granted to the military establishment. The same act also exempted seamen and marines during their term of service from all personal arrest for debt or contract. The greater part of the above still remains in force.*

From time to time the corps has been increased and reduced as war or peace or politics suggested (see table), and has now by law the strength of July 25, 1861, although annual appropriation has been made for one thousand privates less since 1874. The President has power to substitute marines for landsmen (act March 3, 1849); to provide regulations for their discipline; to

* Among the earlier acts passed by Congress relating to the marine corps are: an act for the establishing and organizing of a marine corps, June 11, 1798; an act authorizing an augmentation, March 2, 1799; to fix rank and pay of commandant (substituting lieutenant-colonel for major), April 22, 1800; an act authorizing an augmentation, March 3, 1809; an act for same purpose, April 16, 1814; to fix the peace establishment, March 3, 1817; resolution relating to compensation of officers, May 29, 1830; an act concerning certain officers, July 14, 1832; resolutions respecting the pay, May 25, 1832; an act to improve the condition of the enlisted men of the army and marine corps and prevent desertion, March 2, 1833; an act for the better organization, June 30, 1834; and an act making certain allowances to captains and subalterns, June 30, 1834.

† This act added 8 surgeons.

‡ Peace Establishment Act.

§ For the war with Mexico.

‖ By President, under act of March 3, 1849.

¶ By appropriation act.

** Substituted for colonel commandant March 2, 1867, and reversed June 6, 1874.

†† Lieutenant-colonel commandant substituted for major.

make alterations in the component parts of the ration; to retire officers who may be disabled, or have attained the age of 62 years; to advance officers not exceeding 30 numbers in rank for "eminent and conspicuous conduct in battle or extraordinary heroism"; to advance officers one grade who have received the thanks of Congress by name; to confer brevet commissions as in like cases in the army (act 1814); to fill vacancies in the line first by promotion and then by appointment; in the latter case to be between 20 and 25 years (if from civil life), and subject to mental and physical examination (act July 25, 1861).

Officers are on the same footing as to rank and privileges as similar grades in the army; take precedence of like rank in the volunteers and militia; may be associated with officers of the army on courts-martial, the senior to preside; are promoted by seniority up to colonel; cannot exercise command over the navy-yards or vessels of the United States (act June 30, 1834); and no officer can absent himself without leave until notified of the acceptance of his resignation. The staff is separate from the line, and appointed by the President by selection from the officers of the corps, as is the commandant. The judge-advocate-general of the navy may be appointed from the officers of the marine corps. (See JUDGE-ADVOCATE-GENERAL.) Both officers and men, when serving with the land forces, are entitled to transportation, subsistence, camp equipage, etc., on requisition; are entitled to the benefits of the homestead laws and of the government hospital for the insane; to pensions for wounds, injury, or disease; to artificial limbs or commutation therefor in certain cases; to credit for previous service in the volunteer army or navy; to share in prize-money and the salvage of recapture; to indemnity for loss of effects where vessel is sunk or destroyed (since April 19, 1861); and to pay and allowances of like grades in the infantry of the army, which is paid monthly by the paymaster of the corps while serving ashore, less 20 cents deducted for naval hospital fund. Officers receive mileage at 8 cents per mile, and the men 75 cents per diem when traveling without rations.

Officers enter at the foot of the list of second lieutenants,—appointed, usually from civil life, through political or personal influence,—are instructed at the headquarters of the corps in Washington, and thence distributed to posts; later they may attend the artillery and torpedo schools. Being combatants, they are, in reference to "line and staff," classed as line-officers, except the five who constitute the marine staff (adjutant, paymaster, quartermaster, and two assistant quartermasters); on shore, are subject to detail for all military duties, and on board ship either command the guard or serve as juniors with the commander; the senior is assigned the fourth room from forward on the port side, and the junior takes quarters according to his rank; when two or more are attached to same ship, one is required to be on board at all times for duty. By regulation the senior is required to report daily, in writing, to the commanding officer of the vessel the state of the guard; to keep the muster-rolls, and have charge and make returns of the clothing, arms, and other property belonging to the marines; to exercise them in the prescribed drills at such times and places as the commanding officer of the vessel may appoint; to be attentive to their comfort and cleanliness, as well as their soldier-like appearance and efficiency; to inspect the extra clothing once a month, and report its condition; to report his guard or division when mustered at quarters; to see that they are properly stationed and instructed as sentinels, and to frequently visit them at night. All general orders to sentinels must pass through him, and any misbehavior on guard or on duty as sentinels must be reported to him by the officer-of-the-deck. When serving on shore with sailors in mixed detachments, the marines are posted on the right without regard to the rank of the officers commanding companies. The senior marine officer of a squadron is known as the fleet marine officer. He organizes and inspects all the marines in the squadron, commands the guard of the flag-ship, and is usually the judge-advocate of the station. (See JUDGE-ADVOCATE.) A bill has been reported favorably in Congress to give this officer while so serving the rank and pay of major. Field-officers are not sent to sea. All company officers are on the sea-roster, which is kept by the commandant, and they are expected to go in regular turn. Three years constitutes a cruise and entitles to shore duty.

Non-commissioned officers correspond in grade to those of the army; are selected from the privates for character, bearing, and proficiency in drill; are examined in reading, writing, spelling, arithmetic, tactics, and duties, and when recommended by a board of at least two officers receive parchment warrants from the commandant, and can only be reduced by his authority or the sentence of a court-martial; vacancies occurring at sea may be filled by the commanding officer of the vessel upon the recommendation of the marine officer, provided the candidate be reported qualified by a board of three officers; if reduced the warrant is returned, but if honorably discharged it may be retained; upon re-enlisting within thirty days their rank is continuous; they recite tactics from time to time, and being borne on a general corps roster have many opportunities for promotion. Pay for 50 first sergeants is at present appropriated, some of whom are in charge of small guards. Their chevrons, or distinguishing marks of rank, are the same as in the army, but are worn inverted; the colors are orange on a scarlet ground.

Enlistments are for a period of five years; are not to be made on foreign stations, nor are men to be discharged except from a barracks; enlisted men receive same pay and bounty for re-enlisting as those of like grades in infantry; persons enlisted in the military service may, on application, be transferred by the President to the marine corps; the band receives $4 per month extra pay, each man, for playing on the Capitol grounds or the President's grounds; and all marines are entitled to one navy ration daily. Formerly the ration was prescribed for each day in the week, by law, with the liberal addition of "a half-pint of distilled spirits or one quart of beer daily." In old times marines were allowed to the revenue cutters, and in the regulations for the navy, enacted in 1798, are referred to as "marine soldiers." Enlistments were then made for one year, subject to extension or discharge by the President. In the primary legislation great

stress was laid upon the importance of both officers and men being "good seamen," or acquainted with maritime affairs. Now, while it is desirable that they should know something of the sea, it is not required and not advisable that they should be "good seamen." That would go far to neutralize their chief value as an element non-assimilating in the ship's complement. Credit is given to both officers and men for previous service in the volunteer army or navy, and as re-enlistment in either the army or marine corps within thirty days of honorable discharge entitles to increased pay for continuous service, men are frequently found in each who have served one or more enlistments in the other.

Recruits must be at least 5 feet 6 inches high, between 18 and 35 years of age, able to read and write, of steady habits, unmarried, well made, sound as to senses and limbs, and of good health. They enter voluntarily, undergo strict medical examination by a naval surgeon, and are attached to barracks for instruction before being sent to sea. The drill on shore embraces the schools of the soldier, company, and battalion, skirmishing, target-practice, the bayonet exercise, and all military duties and ceremonies. Afloat, this continues so far as may be practicable, and to it are added the great gun or artillery drill, and by some officers instruction in swimming, rowing, the signal code, and the broadsword. Upton's Tactics and the Ordnance Manual are employed, the former since 1867. Reports of drills and instructions are required to be made monthly; the commandant inspects each post (except Mare Island) annually, the adjutant does the same quarterly, and a captain, who is a member of the permanent Inspection Board, sees the guards of all ships sailing upon or returning from a three years' cruise. Boys over 14 are enlisted as apprentices to learn music, —the drum and trumpet,—and bandmen are enlisted and classed after examination at headquarters, Washington, where the band is permanently stationed. The regulations for the recruiting service of the army apply to the marine corps so far as practicable.

The arm in use at present is the Springfield (U. S.) rifle, calibre .45, and the knapsack, haversack, canteen, and rifle-sling are of the infantry pattern. Belts are of English buff leather worn white, and boxes black. Clothing, rations, quarters, fuel, medicines, and medical attendance are furnished by the government. The former, now made by the quartermaster's department in Philadelphia, is of excellent quality, and a careful soldier can save out of his allowance of clothing from \$75 to \$100 in five years, which is paid to him in cash on discharge. The ration is sufficient and substantial. The uniform (revised in 1876) is varied and elaborate. The full dress rather gaudy, but the rest neat and in good taste; caps and coats dark blue; trousers and overcoats sky-blue; trimmings for officers are scarlet and gold, for men scarlet and orange; musicians wear scarlet coats with white piping for full dress; fur hats and Arctic shoes are issued for winter, and white helmets and linen trousers for summer and the tropics. The cap device, formerly a bugle, has been since 1869 a metal hemisphere on an anchor and surmounted by an eagle. Blouses braided with black mohair were adopted for officers in 1870.

The discipline is based upon the laws and regulations for the government of the navy, which apply to them at all times, except when serving with the army (act June 30, 1834). (See COURTS-MARTIAL.) The military spirit is sedulously cultivated, and severe punishments seldom inflicted. Whenever a man is transferred, his character must accompany him, the words used being "excellent," "good," or "bad," and no others. This is entered upon his descriptive list, and on his final discharge. "Bad" on a discharge precludes re-enlistment. Intemperate and unreliable men are specially discharged upon recommendation of their commanding officers, accompanied by their records, as "unfit for the service." Drunkenness and desertion are decreasing each year. The sale of malt or spirituous liquors in barracks is forbidden, and enlisted men are not allowed to act as sutlers or sutler's agents, nor to trade with each other.

A marine detachment serving within a navy-yard is subject to the orders of the commandant of the yard, but no part is to be relieved or withdrawn except by order of the commandant of the marine corps, approved by the Secretary of the Navy. Officers joining such a detachment report first to the commandant of the yard, then to the officer commanding detachment. The latter is charged with the police, internal government, and instruction of the marines; causes guards and sentinels to be posted wherever required by the commandant of the yard, and makes a daily report to him of the number and disposition of the force under his command. He issues every morning, in writing and under seal, the countersign for the ensuing night; grants the customary liberty to the enlisted men; requires the daily rations and meals to be inspected and made to comply with the contract; reports misconduct on the part of the guards or sentinels to the commandant of the yard; enlists recruits, and forwards staff returns of men transferred; sees that the exercises and formations at parades, reviews, inspections, funerals, etc., and the camp and garrison duties, and the salutes, are the same as the army; requires a daily drill of one hour, and that officers and men in garrison wear the prescribed uniform.

Details of enlisted men for sea-service are made from rosters kept at each post, so that they may go in turn, unless they volunteer. Three years is the tour, at the expiration of which time they are relieved. Unless a ship is unpopular, there is generally a surplus of volunteers. Indifferent or unworthy men are not permitted to go. Guards for ships are made up at the nearest barracks, and march on board when the ship goes into commission fully organized, accompanied by their officers and ready for duty. They salute the flag when it is hoisted, salute it when it is hauled down at the end of the cruise, and are the last to leave the ship. They are entered separately on the books; are upon the same footing as seamen with regard to provisions; are furnished with certain articles of clothing and small stores by the paymaster when their commanding officer certifies that they require them; when not on guard or on duty as sentinels, are subject to the orders of the sea-officers in the same manner as the crew; are not to be diverted from their appropriate duties, nor called upon to coal ship or work as mechanics, except in cases of emergency;

are not to perform duty above the rail, unless to act as sharpshooters in the tops; may be assigned as parts of gun's crews in divisions other than their own; when sentinels, must receive orders through the sergeant or corporal of guard.

Their particular duties on board ship are, as sentinels to watch over the magazines, store-rooms, gangways, galleys, boats alongside, approaching, or passing, and all lights and fires required for the use of the ship, and to give the alarm in case of fire; to preserve order, and allow no swearing, gambling, or immoral practices; to prevent injury or theft of public or private property, or interruption of the cooking duties; to allow no smoking or washing except at the prescribed hours; to allow no enlisted man or boat to leave the ship without the authority of the officer-of-the-deck; to guard the ordinary prisoners and the prisoners of war, who sometimes outnumber the crew; and at all times to sustain discipline by their organization, distinctive character, and peculiar training. In port they constitute the deck guard, to render honors or assistance, and at sea they are (at least a large portion of them) always near their arms, to prevent surprise from without and check insubordination from within. In action, they man and fight a division of the spar-deck battery, fill vacancies at other guns, scour the enemy's decks from the tops, the poop, or forecastle with their rifles, cover the boarding-parties with their fire, and repel boarders with fixed bayonets. Should the enemy gain a foothold, they rally at the mainmast, so as to command the deck. In case of fire they guard the boat's falls and officers' quarters, prevent panic or pillage, compel compliance with the orders of the officers, and allow no one to throw overboard any property or fittings, or abandon the ship, until duly authorized.

In the landing-parties and boat expeditions they go thoroughly equipped, and are distributed among the several boats. In mixed operations on shore, such as the surprise of a camp or post, or the escalade of a fort, picked men are sent with the pioneers, and the rest form the supporting column, and in case of failure, cover the retreat and embarkation of the sailors. The venerable Senior Flag-Officer Stewart said of sailors: "They are a class whose onset and first efforts are tremendous and formidable, but if resisted and discomfited they break into groups, become a mere mob, and without a body of regular troops to sustain them must fall a sacrifice." A frequent duty abroad is to guard the American legations and consulates, and the interests of American citizens in times of revolution or public disorder, and to protect surveying and astronomical parties.

The present allowance of marines to ships varies with their class or rate. The old rule was a marine to each gun; but guns were then smaller and much more numerous. This table is generally used:

Vessel.	Rate.	Guns.	Displacement.	Captain.	Lieutenant.	Sergeants.	Corporals.	Music.	Privates.	Aggregate.
Colorado and class	1st	30	4700	1	1	3	4	2	40	51

Flag-ships are allowed 5 privates additional.

The following is a list of the commandants from the beginning, with their rank and date of commission or appointment:

Samuel Nichols, major, June 25, 1776.
William W. Burrows, lieutenant-colonel, May 1, 1800.
Franklin Wharton, lieutenant-colonel, March 7, 1804.
Anthony Gale, lieutenant-colonel, March 3, 1819.
Archibald Henderson, lieutenant-colonel, October 17, 1820; colonel, July 1, 1834; brevet brigadier-general, January 27, 1837.
John Harris, colonel, January 7, 1859.
Jacob Zeilin, colonel, June 10, 1864; brigadier-general, March 2, 1867.
Chas. G. McCawley, colonel, November 1, 1876.

Gen. Henderson died January 6, 1859, having served his country 53 years, of which 39 were in command of the corps. Col. Harris died May 12, 1864, having served 50 years, and 5 in command. Gen. Zeilin was on the active list 45 years, 12 years in command, and is living at this date (October 1, 1880) in Washington.—*Henry C. Cochrane, Captain U.S.M.C.*

Marine Corps of the Confederate States. Before the attack on Fort Sumter, the Confederate States began the organization of a marine corps, the first appointment bearing date March 25, 1861. Mr. Mallory, the Secretary of the Navy, cordially welcomed all seceders from the United States service, and generally gave them precedence over other appointees. The organization was that of an infantry regiment of 10 companies, numbering 1000 men, with a colonel commandant and three staff-officers with the rank of major. Its headquarters were in Richmond, and Major Lloyd J. Beall, who had been a paymaster in the U. S. army, and was an old friend and classmate at West Point of Mr. Jefferson Davis, the President of the Confederate States, was appointed commandant.

The principal command—four companies, under Capt. John D. Simms—was stationed during the war, when not engaged in expeditions, at Drury's Bluff, on James River, as a permanent garrison. When it was believed in Richmond that the Federal ironclads intended to force an entrance into Charleston harbor, Capt. Simms

was sent with 200 men to that point, where they were provided with liquid fire in bottles and then distributed among the different blockade-runners in port, with orders to board the ironclads upon their approach and pour the combustible into any apertures which might be accessible. The marines remained at Charleston about a month, and then returned to Drury's Bluff, which they held until Richmond was abandoned, and later were captured as a part of Ewell's corps, after a three hours' fight at Sailor's Creek, and sent to the prison camp at Johnson's Island.

Other companies served at the naval depots in Richmond, Savannah, and Mobile, at Pensacola and Norfolk until those places were captured, and at Fort Fisher. Capt. R. T. Thom commanded the marines of the "Merrimac" in the great fight with the fleet at Hampton Roads, and Lieut. B. K. Howell, a brother-in-law of the Confederate President, was on the privateer "Alabama" until she was destroyed. The marines of Tattnall's fleet, at the battle of Port Royal, were commanded by Capt. Geo. Holmes and Lieut. Raney, and the guard of the naval depot at Mobile by Capt. Meiere. Other officers were assigned to vessels in the river and harbor flotillas, and some were on duty with the armies. Capt. Tattnall was for a time colonel of an Alabama regiment, and Capt. Hays a lieutenant-colonel on the staff of Gen. Bragg. Lieut. Sayre was also with the army. Capts. Jacob Read and Geo. P. Turner were dismissed. Major Allison had been a purser in the U. S. navy.—*Henry C. Cochrane*, *Captain U.S M.C.*

Marine Corps, Foreign. Until the year 1664 the British navy was manned by means of the system of impress, or by enlisting landsmen ; but the commerce of England at that period was so limited that these measures were found inadequate to procure sufficient seamen for the public service, and this difficulty suggested the formation of marines. The men were raised with the object of forming a nursery to man the fleet, and being quartered in or near the principal seaports, their great utility in the equipment of squadrons soon made it desirable to augment their strength. The first order in council which has reference to this subject is dated the 16th of October, 1664, authorizing 1200 soldiers to be raised and formed into one regiment. From 1776 to 1784 the average strength of the royal marines amounted to 18,790 officers and men. In 1844 the total strength amounted to 10,469. The aggregate strength at the present time is 15,000 non-commissioned officers, musicians, and privates, and the following officers:

ARTILLERY—*General Officers.*—1 general, 1 lieutenant-general, and 2 major-generals.

LIGHT INFANTRY—*General Officers.*—2 generals, 2 lieutenant-generals, and 5 major-generals.

General Staff.—1 deputy adjutant-general, with rank of major-general, 1 quartermaster.

ARTILLERY—16 *Companies.*—1 colonel commandant, 1 colonel, 3 lieutenant-colonels, 40 captains, 47 lieutenants.

Staff.—1 staff-captain, 3 instructors of gunnery, 1 instructor of musketry, 1 adjutant, 1 military instructor, 4 quartermasters, 1 barrack-master, 1 paymaster, 1 staff-surgeon, 2 surgeons.

LIGHT INFANTRY—48 *Companies.*—3 colonels commandant, 5 colonels, 12 lieutenant-colonels, 111 captains, 146 lieutenants.

Staff.—3 instructors of gunnery, 4 instructors of musketry, 7 adjutants, 7 quartermasters, 4 paymasters, 4 barrack-masters, 1 deputy inspector-general of hospitals, 1 staff-surgeon, 6 surgeons.

The military education of the officers of the Royal Marine Artillery is thorough. The cadets are obliged to undergo a course of study for two years, during which they are expected to acquire a competent knowledge of arithmetic, algebra, geometry, plane trigonometry, the use of the sextant, fortifications, a practical course in naval gunnery, English history, and French. If, on obtaining his commission, the young officer is selected to qualify for the artillery, he must be prepared at the end of the year to pass an examination in analytical trigonometry, differential and integral calculus, conic sections, statics and dynamics, hydrostatics and steam. The men are volunteers from the light infantry divisions. The course of training is very comprehensive; it includes the usual infantry drills and musketry instructions, field guns and rockets, field-battery movements, the service of heavy ordnance; a laboratory, including use and preparation of tubes, rockets, and fuses, making up cartridges, the manufacture of port-fires, signal-lights, and rockets, and all matters connected with the theory of projectiles as may have a practical application.

The marines of Germany were selected, when organized, from the *élite* of the army, and that corps ranks next to the English marines in discipline and efficiency. Spain and Italy have, also, a large and well-disciplined force of marines. The organization of the French marines is considered the most important and efficient of the military forces. The duties of this corps are entirely confined, however, to the protection of dock-yards and arsenals, and to the occupation of forts on the sea-coast. Turkey, although occupying an unimportant position among the great naval powers, has organized a corps of marines which compares favorably with those of other countries.

It is a fact not generally known that a corps of marines existed in the Roman army, but it is, nevertheless, a fact; and also that a marine cohort was stationed in England. In Bruce's "History of the Roman Wall," which divided England from Scotland, the author states that, "In ascertaining the number and the names of the stations, a most valuable document has come down to our times from the period of the Roman occupation. The *Notitia Imperii* was, probably, written about the end of the reign of Theodosius the Younger, and was certainly composed before the Romans abandoned this island. It is a sort of list of the several military and civil officers and magistrates, both in the Eastern and Western Empires, and the places where they were stationed. It may, in fact, be regarded as the Army List of the Roman Empire." The portion of the section containing the information we quote is headed, *Item per Lineam Valli*,—"Along the line of wall,"—and after detailing 17 cohorts or wings of cohorts, with their stations, arrives at "The Tribune of the First Marine Cohort, styled Ælia, at Tunnocelum." Thus there was a first, and therefore a second, and possibly many other marine cohorts, in the Roman army.

Marine Hospital Service of the United States. This service dates its establishment from July 16, 1798, at which time an act for the relief of disabled and sick seamen was passed by Congress, after the subject had been before that body for several years. Hospital money had been collected in the colonies for nearly sixty years previous to the establishment of the service, so that Congress was undoubtedly familiar with the system. The first hospital exclusively for seamen was the magnificent naval hospital at Greenwich, England, commenced by Charles II., and ordered by Queen Mary to be completed "as a retreat for seamen disabled in the service of their country." The Royal Hospital for Seamen at Greenwich was built by order of King William soon after Queen Mary's death. By an act of Parliament passed in the second year of George the Third's reign, the seamen of the American colonies were obliged to contribute to the support of this hospital, and sixpence per month was the tax deducted from the wages of all seamen, English subjects, sailing to and from American ports. The Archives of Pennsylvania (vol. i. p. 251) show that four receivers, Richard Fitzwilliam and John Moore, Philadelphia, Alexander Keith, Newcastle, and Henry Brooke, Lewes, were appointed in 1729 for the province of Philadelphia. This example of the utility of marine hospitals had a marked effect upon the colonies, and as early as 1780 the Commonwealth of Virginia taxed all seamen and marines in the State the sum of ninepence per month as hospital money, and the naval officers were authorized to collect it, being allowed five per cent. commission on all moneys collected. In October, 1782, the tax was increased from ninepence to one shilling per month. December 20, 1787, Virginia passed a law establishing a marine hospital, and authorized the governor to appoint a commission to select a site in the town of Washington, Norfolk County, Va. In 1789 North Carolina enacted a law creating a hospital fund, and in 1790 the commissioners of the poor at the various ports of entry were appointed the collectors for this fund. The tax (per capita) was graded as follows: captains 5*s.*, mates 2*s.* 6*d.*, and each member of the crew 1*s.* 6*d.* A bill was presented to Congress on August 28, 1789, providing for the adoption of harbor regulations and the establishment of hospitals. The records of the Boston Marine Society show that they are entitled to the credit of presenting the first memorial to Congress on this subject, their petition praying for the establishment in the United States of three marine hospitals having been presented in the House January 27, 1791, but it was not until 1794 that any action was taken in regard to this or other petitions which had been presented to Congress, and the bill passed then was one providing for the aid of our seamen in foreign countries, and two resident agents, one for Great Britain and one for the West Indies, were appointed. In February, 1797, the committee appointed to inquire into the operation of the act for the protection and relief of American seamen, recommended the passage of resolutions fixing a tax on the wages of every seaman sailing from any United States port, and to the establishment of hospitals for the relief of disabled and sick seamen, but it did not become a law until the following July. The tax fixed by this law was 20 cents per month from the pay of all seamen. On March 2, 1799, an additional act passed Congress authorizing all moneys collected within any one State to be expended in such State; this, however, did not apply to the States of New Hampshire, Rhode Island, Connecticut, and Massachusetts, as they mutually supported the Charlestown, Mass., hospital. This act also taxed the officers, seamen, and marines of the navy, and entitled them to the benefits of the hospital fund.

The report of the Secretary of the Treasury on the condition of the service, dated February, 1802, shows that hospitals had been established at Boston, Newport, Norfolk, and Charleston, solely supported by funds raised under the authority of the United States; that the Baltimore hospital was under the control of the Board of Health, although supported by the United States; that the sick seamen of New York and Philadelphia were received in the city hospital, a fixed rate per week being paid for their care and treatment out of the marine hospital fund; and that at Portland, New London, Wilmington, N. C., Newbern, Edenton, and Alexandria, they were afforded temporary relief in private boarding-houses; that the total amount received from seamen, in public and private service, was $147,875.58, $6185.33 of which had been applied to the purchase of the Gosport hospital; $74,636.51 was the total cost for the relief and treatment of sick seamen, and $6707.87 was returned to agents who had expended more than they had collected, $73,761.61 remaining unexpended. In May, 1802, an act was passed, amending the act of 1797, by which the sum of $15,000 was appropriated for the erection of the Boston hospital; the moneys collected on account of the hospital tax were constituted a general fund; and the directors of the marine hospitals were to be held accountable for the moneys received, and also be allowed one per cent. commission on all moneys disbursed.

In 1803 the marine hospital at Charlestown, Mass., was built; the same year one was permanently established at New Orleans, and in 1804 the necessary equipments were furnished to this hospital. The Secretary's report of 1806 shows that contract physicians were employed at Newport, New London, and Baltimore, the only marine hospitals in operation at this time being at Boston and Norfolk; and that sick and disabled seamen were treated in the almshouses at Portsmouth, N. H., Portland, Me., Newport, R. I., and Alexandria, Va., and that at New York, Philadelphia, and New Orleans the local hospitals furnished the necessary relief. The amount of $55,649.29 was reported by the Secretary of the Treasury, February, 1811, as having been paid in, on account of the hospital fund. February 26, 1811, the law creating the naval hospital establishment and separating the naval fund, was passed. The following table shows the number of American seamen who received treatment and relief in the marine hospitals from 1796 to 1812:

1796	4,849	1805	10,722
1797	9,021	1806	9,900
1798	7,031	1807	7,937
1799	6,514	1808	1,121
1800	3,390	1809	9,170
1801	6,917	1810	3,668
1802	891	1811	4,828
1803	10,724	1812	3,252
1804	6,822		

In February, 1818, the hospital at Boston was partially destroyed by fire, and the new Boston marine hospital was not finally located until 1827, at Chelsea; in 1836 this and the hospitals at Norfolk and Charleston, S. C., were the only marine hospitals, and the last was not managed by the government, but under contract with the city authorities. On March 3, 1837, an act was passed appropriating $70,000 for the erection of the New Orleans marine hospital, $15,000 for three sites on the Mississippi and one on Lake Erie, and $10,000 for the erection of the Mobile hospital, and the sum of $150,000 was appropriated for the relief of seamen, and at the same time the tax of 20 cents per month on the wages of each seaman was suspended for one year; it was, however, a long time after the passage of this act to the date of the establishment of the marine hospitals along the Mississippi River and the Lakes, as the circumlocutory manner followed by the government caused innumerable delays; for example, the act authorizing the establishment of a hospital at Ocracoke, N. C., was approved August, 1842; the site was selected January, 1843; purchase sanctioned by the Secretary of the Treasury, April, 1844; title examined and made good by Attorney-General, May, 1844; the Department advised of the transfer by the State to the United States, January, 1845; proposals for building received in March, 1845; papers referred to the collector of customs at Ocracoke, May, 1845, and it was reported to the House that the building would cost $5497, and be finished in September, 1845, three years being required to select the site, purchase the ground, and erect a building which could have been completed with all its details in six months. The act passed March 1, 1843, extended the provisions and penalties of the service to the owners, masters, and seamen of registered vessels employed in the coast trade. The report of Drs. Edwards and Loring, who were appointed a board to inspect the hospitals then in operation and in process of construction, states that the condition, arrangement internally, and expense of the hospitals in operation vary with their number and location, and recommends that the hospital grounds and building at Chelsea be sold, a part of the naval tract purchased, and a new building be built thereon; that the hospital at Ocracoke be discontinued, and one at Wilmington be established, as the necessity for a hospital at this place was very urgent. The report also mentioned very favorably the hospital at Louisville, nearly completed, also the one at Pittsburgh; it favored a tonnage duty on all vessels, including fishing-vessels, and also recommended hospitals at Detroit, Buffalo, Cincinnati, and one or more ports in Maine; and also proposed to place the hospitals under the control of a "chief surgeon," who shall have his bureau attached to the Treasury Department. No action having been taken by Congress to secure proper uniformity in the marine hospitals, it is not surprising that the Secretary became disgusted, and reported, as he did, June 30, 1852, adversely to the erection of more marine hospitals. Secretary Cobb desired the abolition of the entire system, his report of June 30, 1858, showing astonishing discrepancies between the necessities of the case and the amount appropriated: "At Natchez, Miss., the hospital cost $53,250, and no return of patients admitted during the year had been received; at Portland, Me., the building constructed had cost $100,000, and only 61 patients had been relieved during the year, at an average cost of $3 per week; at Pensacola, 17 patients, at an average cost of $3.50 per week, had been medically treated."

In 1861 there were United States marine hospitals at Mobile, Ala.; Louisville, Ky.; Key West, Fla.; Galena, Ill.; Evansville, Ind.; Detroit, Mich.; Cleveland, O.; Chicago, Ill.; Charleston, S. C.; Cincinnati, O.; Burlington, Vt.; Chelsea, Mass.; Natchez, Miss.; Napoleon, Ark.; Norfolk, Va.; Burlington, Iowa; Wilmington, N. C.; San Francisco, Cal.; St. Marks, Fla.; St. Louis, Mo.; Portland, Me.; Pittsburgh, Pa.; Paducah, Ky., and Ocracoke, N. C. In March, 1862, Congress appropriated $200,000 for the marine hospital fund, and authorized the Secretary of the Treasury to sell the hospital at Burlington, Iowa, to use it for sick and wounded soldiers, or to close it, whichever he should deem the best for the interests of the government. During the war, owing to the sale or transfer of many American vessels abroad, the receipts from the marine hospital tax were lessened to a considerable extent; and to obviate this difficulty Congress enacted (April 29, 1864) that all hospital money that had become due should be collected by the agent or consul at the time of the transfer or sale of the vessel, and if not paid by the owner or master of the vessel, the transfer or sale was declared void. The hospitals at Charleston, S. C., Cincinnati, Ohio, and Burlington, Vt., were sold in 1866, and in 1867 the hospitals at Evansville, Ind., and Burlington, Iowa, and the hospital grounds at Paducah, Ky. (the building having been destroyed during the war), were sold, and the marine hospital at St. Marks, Fla., was transferred to the War Department. In 1868, the hospital at San Francisco was partially destroyed by an earthquake, and the one at Napoleon, Ark., was swept away by the river. In 1869, Dr. W. D. Stewart was appointed inspector of marine hospitals for the Treasury Department; he was succeeded by Dr. Billings, of the army. January, 1870, a bill reorganizing the service was submitted to the House by Secretary Boutwell. It provided for a systematic national service, and the regulations adopted in accordance with it provided for the examination of medical officers. Section 1 of the act of June 29, 1870, increased the hospital dues to 40 cents per month, and section 6 authorized the Secretary of the Treasury to appoint a surgeon to act as supervising surgeon of the Marine Hospital Service, which title was changed by the act of March 3, 1875, to supervising surgeon-general, and the office was made a Presidential appointment. Dr. John M. Woodworth, of Illinois, a distinguished surgeon during the war, was appointed supervising surgeon, March 23, 1871, and he was also the first supervising surgeon-general. In June, 1872, the contract system was abolished by act of Congress.

Since the reorganization of the service the annual reports show that all useless hospitals have been abandoned, the hospitals at San Francisco and Chicago have been completed, a system of dispensary relief inaugurated, and all medicines are purchased in bulk by the medical purveyor, who distributes them to the various hospitals. During the year ending June 30, 1873,

13,529 sick and disabled seamen were furnished medical and surgical relief; 12,697 seamen were maintained in the hospitals, and 832 others, not requiring hospital treatment, were relieved by furnishing them with medicines and appliances without admission. The following is the result obtained in the treatment of the 12,697 hospital patients:

Discharged cured	8,927
" improved	1,975
" not improved	161
Deserted while under treatment	108
Died	646
Remaining under treatment, June 30, 1873	880
Total	12,697

The average daily number of hospital patients throughout the year was 1151. The total cost of the service for the year, including everything, administration of the service, maintenance, care, and treatment of patients, and the medicines furnished them, expenses attending the burial of those who died, and the entire outfit of the new marine hospital at Chicago, was $422,502.98; the average cost of maintaining and treating each patient being $1.002 per day. The amount collected from seamen during the year was $335,845.95, an increase of $12,145 over the amount collected in 1872, and an increase of $47,700.53 over the amount collected in 1871.

Of the 31 hospitals built by the government since the organization of the service, there remained in use in 1873 ten, situated as follows: Chelsea, Mass.; Chicago, Ill.; Cleveland, Ohio; Detroit, Mich.; Louisville, Ky.; Mobile, Ala.; Pittsburgh, Pa.; Portland, Me.; St. Louis, Mo., and Key West, Fla. Of the remaining 21, fourteen had been sold, one transferred to the War Department, one abandoned, one burned, one destroyed by a flood, and one by a hurricane; one was injured by an earthquake and abandoned, and one remained unfinished, its completion being impracticable. There were also 81 ports where hospital relief was furnished to sick and disabled seamen in private or municipal hospitals at rates authorized by the Treasury Department.

During the year ending June 30, 1875, the seventy-seventh year of the operations of the service, and the fourth year of its reorganization on its present basis, its relief operations embraced 94 sea and inland ports of the United States, at which were relieved 15,009 sick and disabled seamen; 12,939 of these were treated in hospitals, and 2070 were relieved at the offices of the surgeons. The amount of hospital tax collected in 132 customs districts during the year amounted to $338,893.78, and the net expenditures out of the appropriation were $404,390.60. The legislation of the Forty-second Congress, in relation to the Marine Hospital Service, provided (1 and 2) for the collections of dues and the seamen's time-book; (3) definition of the term seaman; (4) lease of hospital buildings and grounds; (5) provision for insane seamen; (6) rate of charge for care of foreign seamen and of seamen belonging to the engineer corps of the army, the navy, the coast survey, and light-house service, and it is a noticeable fact that each of the above services has taken advantage of this provision, which is intended for their convenience and accommodation. From the establishment of the service in 1798 until 1873 appointments of medical officers were made without any preliminary examination. Since 1873 no appointments have been made except of such persons as have passed a good practical examination of professional qualifications. The new pavilion hospital at Mountain Lake, near San Francisco, which was commenced in June, 1874, was occupied in June, 1875, though not entirely finished. The aggregate cost of the hospital was $73,884.06. For the years 1876–77 the results attained were particularly gratifying, as within the fiscal year ended June 30, 1877, the collections of the hospital-dues amounted to $372,465.70, while the expenditures amounted to $368,395.28, showing a surplus of receipts over expenditures of $4070.42. During this year 15,175 seamen (10,975 in hospitals and 4200 office patients) were relieved by the service,—the average cost, $24.22 for each patient, being the lowest ever reached. March 14, 1879, Dr. Woodworth, the first supervising surgeon-general, having died, the present incumbent, Dr. John B. Hamilton, at that time a surgeon, was promoted to fill the vacancy. The officers of this service are of five grades, viz., supervising surgeon-general, medical purveyor, surgeons, passed assistant surgeons, and assistant surgeons. These are designated medical officers. At ports where the service is not large enough to warrant the assignment of a regular officer a resident physician is appointed as acting assistant surgeon. During the fiscal year ended June 30, 1879, 20,922 seamen (11,499 hospital and 9423 dispensary patients) were furnished relief by the service. The receipts were $361,409.58, and the expenditures $375,164,01, and the per capita cost was reduced from $24.22 in 1877, and $20.04 in 1878, to $17.93 for 1879. The steadily increasing number of patients treated by this service is abundant proof of its able management and the high esteem with which it is regarded by all of our sea-faring population, and it is also gratifying to add that it is meeting with the attention at the hands of Congress and commercial interests throughout the country that its object, character, and growing importance demand. The annual report for the fiscal year ending June 30, 1880, shows that while the 11,356 patients treated in 1869 cost $406,089, the 24,860 sick seamen relieved this year cost only $402,185, and the per capita cost has been still further reduced from $17.93 in 1879 to $16.18 in 1880. These gratifying results are attributed chiefly to the fact that the appointment of the medical officers of the service, upon whose professional skill, fitness, and faithfulness its character and conduct of course largely depend, have been removed from the influence of politics. The service is also now giving special attention to the physical examination of seamen. The medical officers of the service now examine without fee the crews of all vessels whose owners request it, and the adoption of this method of examination by all vessel-owners and masters will naturally result in the crews of American vessels attaining a high rate of physical ability.

Marine Insurance is a contract whereby one party, for a consideration or premium, which is usually paid in money, either in one sum or at different times during the continuance of the risk, undertakes to indemnify the other against certain perils or sea risks, to which his ship, freight, or cargo, or some of them, may be ex-

posed during a certain voyage or for a fixed period of time.

The party who takes the risk upon himself, or who undertakes to indemnify, is called the assurer, insurer, or underwriter (the latter term growing out of the practice of his subscribing his name at the bottom of the contract); the party protected by the contract, the assured or insured; and the money paid as the price of the indemnity, the premium. The contract itself, or, rather, the written instrument evidencing it, is called a policy of insurance. In England, continental Europe, and in most of the States of the United States, statutory enactments render it imperative that the contract should be reduced to writing; but in the absence of such statutes the contract is not invalid by reason of its having been made by word of mouth.

Printed forms of policies are now almost universally used. There are six essential parts to every policy,—

1. The parties.
2. The premium.
3. The subject insured.
4. Amount insured.
5. The risks.
6. The voyage or terms of the risk.

When the insurance is on a voyage from one port to another, without reference to time, the policy is called a *voyage* policy; but when it is from one fixed period to another, or for so many months, it is called a *time* policy.

When the value of the property insured—as between the assured and the underwriter—is expressed on the face of the policy, the policy is called a *valued* policy. When it is not so expressed, but is left to be estimated in case of loss, the policy is called an *open* policy.

The contract requires the most perfect good faith. If the insured makes false representations to the underwriter in order to procure his insurance on better terms, it will avoid the contract, though the loss arose from a cause unconnected with the misrepresentation or concealment.

For further information recourse to the following authorities is suggested: Marshall on Insurance, Duer on Insurance, Pardessus on Insurance, Flanders on Insurance, Addison on Contracts, Kent's Commentaries.—*Theodore M. Etting.*

Marine Rams. From the earliest history of man afloat the marine ram was a weapon of war, until improvements in the use of sails and the increased size of vessels made mere muscular exertion impotent, however many men might be employed in rowing. It must not be supposed that sails were not in use in those long periods of time during which the waters of the Mediterranean bore those exponents of naval power of many succeeding nations and peoples. Sails transported them over long distances, but the effective use of a vessel in ramming can exist only when her course can be changed at will, quite independent of the direction of the wind. Yet seamen in the olden time watched their opportunity, when vessels were engaged under sail, to "run down" an adversary. Blows thus delivered were sometimes effective, but if not, when once in contact, it became a hand-to-hand affair, known in modern times as "carrying a vessel by boarding." The invention of gunpowder, until steam became a motor, made the act of ramming almost obsolete, inasmuch as the attempt would expose the vessel to a "raking fire" of the enemy. As soon as the use of steam was established a power existed quite obedient to the action of the helm; the course was no longer dependent upon the direction of the wind. In force, too, and continued exertion, the propelling power as compared with oars was gigantic.

Able naval men were not slow to recognize again the marine ram as a powerful weapon, as will be seen by examining a model at the Naval Academy at Annapolis, made by Capt. Samuel Barron, U.S.N., in 1827. Years passed, however, before steam became the usual motor of vessels of war; until that period arrived no vessel designed for ramming was built, and even then ramming was regarded simply as an additional force to a gun-power, nor has it passed yet in public acceptation beyond that relation. With those accustomed to the use of ordnance, having a heavy gun available means almost the certainty of using it when an enemy is near. The loud noise, the unmistakable exhibition of force, and the clouds of smoke when the gun is discharged, all tend to give prominence and support to such action. It may be inferred that so long as a marine ram is armed with a gun, so long will its superior power be subordinated to a secondary place as a means of attack.

Heretofore the ram has been combined with a gun or torpedo, and sometimes with both; vessels have been called rams because of different constructions of the bow, in some cases entailing liability to its own destruction, as in striking a vessel having fair headway, moving at right angles to her course. The "Amazon" and the "Stonewall," built in 1864, are of this description. The first named, by accident, ran into a small vessel and sank immediately. The projection, or "snout," of those vessels extended some twenty feet forward from the upper part of the stem, forming an easy curve from it to the line of the keel.

The French constructed the first ram of this description, called the "Taureau," in 1863. Her dimensions were the same as the five other vessels of their navy called rams; her armament, however, was different; she had one 18-ton gun in lieu of the two 12-ton guns carried by the other vessels, which will be mentioned hereafter. The "Taureau" is no longer designated as a ram, but is put down for coast defense. The danger to a ram so constructed is so well recognized now that even what is known as a "spur" projects little beyond the upper part of the stem. A false bow, attached and detached at will, is now fitted by the English, which striking a vessel becomes detached. Only two vessels now completed, in the English navy, are designated as rams,—the "Rupert," 250 feet long, having a displacement of 5358 tons, with an armament of two 18-ton guns, and the "Hotspur," 235 feet long, with a displacement of 4012 tons, and an armament of one gun of 25 tons weight.

The Italians followed the construction of the "Taureau," completing the ram "Affondatore," which was regarded as a very formidable vessel, just before the battle of Lissa, in 1866. Her armament was two 9-inch Armstrong guns. It is stated that her steering-gear and speed were defective; her history during that battle was disastrous, and since has been unsatisfactory. Her

length is 290 feet, draft 20 feet, and displacement 4070 tons.

The "Belier" was the first of a class of five vessels in the French navy not unlike the "Taureau," except in a reduced prolongation of bow. Their length is 216 feet, draft 17 feet, and displacement 3313 tons, armament as stated before, two 12-ton guns.

The "Polyphemus," now nearly completed for the English navy, has a spur of considerable length, and a tube fitted in it to discharge a torpedo; her length is 240 feet, draft 20 feet, and displacement 2640 tons. A peculiarity of the model is that the keel of the fore body of the vessel is not straight, but rises 12½ feet to the "spur," which is 7 feet below the water-line and 7 feet in advance of the upper part of the stem. The frame and armor-plating are of steel; the crown of the armored part is 6 feet above the water-line. There is a false bow built over the armored shell, which would of course be destroyed in ramming a vessel. The "spur" is of such length and form as to make it liable to be carried away in ramming on the beam of a vessel having good headway. If not sunk from injury sustained, the ram will owe her preservation to well-constructed water-tight bulk-heads, and could be of no further use until repaired. She is built on a transverse frame with intercostals called girders, which must be regarded as a very imperfect development of the girder or longitudinal system of construction. The design is that the hull should present as little perpendicular surface as possible to the destructive effect of projectiles discharged from heavy guns, but the purpose does not seem to be satisfactorily carried out. A supposed speed of 17 miles is reckoned upon. Twin-screws are employed for propulsion.

A marine ram designed by a navy officer of the United States was presented for the examination and suggestions of a chief constructor of the navy, whose recommendations were adopted and the plans and specifications presented to the Navy Department. The length of the proposed ram is 200 feet, beam—including sponsons of 3 feet width—36 feet, draft 14 feet, and displacement 1600 tons, the propulsion to be effected either by twin-screws or the Mallory propeller. The amidship cross-section of the vessel is composed of semi-ellipses of 7 and 9 feet semi-conjugates, the latter being the lower section; the plating over the sponsoning forms sharp edges, which are 2 feet below the deep load-line, the steel plating being at that line 6 inches thick, and diminishing towards the crown of the arched deck to 1½ inches over an oak deck, and on the lower section reduced in thickness and riveted to the hull just below the sponsoning. The longitudinal lines are nearly straight for 100 feet, then curves of a parabola towards the ends forming a jointure on the plane of the two ellipses. A pilot-house of heavy steel blocks is designed to inclose the smoke-stack and the steering apparatus; horizontal and angular slits between some of the blocks give a fair sight to direct the movements of the vessel. She is designed to be constructed on 20 girders and a transverse frame to give them a lateral support. In the bow, the girders are bolted in pairs on opposite sides of flanges cast on a steel head, which has a core into which a steel punch is placed, and which projects 2 feet beyond the head. A water-tight skin incloses the frame; two longitudinal bulk-heads are placed far enough from the sides to permit a man to pass, and transverse bulk-heads are placed at distances apart equal to the distance between the floor and the girders above. No armament is proposed except Gatling-guns and small-arms to repel boarders.

The form of the vessel and her construction give her fore body great lateral strength. It is supposed no danger would occur in striking a vessel having a high rate of speed, the sponsoning and steel knife edge of the plating being intended to crush in abaft and rip out forward of the point of impact on an enemy.

The lines of the ram present above the water-line strong re-entering curves, so that the course of a shot striking at the water-line would, if not fired from a distance or from a considerable elevation, vary only 23 degrees from a line tangent to the plating, and diminishing towards the crown, at which its course would be practically tangent. The estimated cost of this vessel is about one-seventh of such armor-plated vessels as she would be expected to attack and destroy.

In considering elements of strength resulting from position it is worth while to consider the anatomy of the sword-fish, a marine ram fashioned by nature. We observe that the flat part of the sword is placed at right angles to an imaginary plane passing through the spine, and that if it pierced the side of an enemy which was moving rapidly, the edges of the "sword" would present the most favorable conditions for ripping itself out, and at the same time the greatest lateral strength of the "sword" would be utilized. The old rams before mentioned are unlike the sword-fish in the placement of the "snout" to the line of keel; the American ram, as designed, has the lateral strength of bow analogous to the anatomy of the sword-fish referred to, or nature's marine ram.

Naval men and others who are not favorably disposed towards the building of marine rams are pleased to assign them some office in a fleet engagement between armor-plated ships. Those who regard rams as capable of destroying fleets of armor-plated, gun-bearing ships propose to meet the latter in fleets, vessel for vessel, or more probably employing two or three rams on each vessel of the fleet and destroying them in detail. Really, the question is whether a given amount of money spent in building marine rams of the best design would not prove more economical than building armor-plated, gun-bearing ships.

No marine ram has yet been constructed which embodies the idea of looking to her striking force as the single element to be employed; until that is done the question naturally is problematical. It can only be solved through a practical development of the best physical conditions to obtain:

1st. Great speed and facility of manœuvre.

2d. Great strength of construction, so that the blows delivered would be diffused throughout the mass of the ram, and if the bows of the ram enter the hull of an enemy even 20 feet or more, that, however great the velocity may be of the vessel struck, the lateral strength of the ram may be sufficient to insure immunity from serious injury, not to say destruction.

3d. A pilot-house that is capable of resisting any projectile known, and provided with suitable arrangements to secure a proper vision.

4th. An impenetrable armor-plated hull of varying thickness, depending upon the angle it presents as a target for the fire of an enemy.—*Daniel Ammen*, *Rear-Admiral U.S.N.*

Marine Steam-boiler. A form of steam-boiler adapted to use on shipboard. It is composed of an exterior shell or casing, either of a perfect cylindrical form, or with rectangular sides stayed together by tie-bars, or of a combination of both, as in the locomotive boiler, within which are contained the furnaces, flues or tubes, connections, and, generally, the ash-pits; the whole surface exposed to fire being surrounded by water, except the furnace-front, and even this is sometimes partially closed by a water-space, leaving only the area required for the furnace-door opening and the front of the ash-pits. In modern practice the water-front has been abandoned, and it is customary to cover the furnace-front by a perforated plate of iron, shielded from the intensity of the flame by an inner plate also perforated, for the purpose of admitting the air required for the complete combustion of the imperfectly combined gases after they have left the bed of coals; the furnace-doors are also perforated. The quantity of air thus admitted should be about three-tenths of that required for the perfect combustion of the fuel. "Water bottoms" of the ash-pits of flat-bottomed boilers, which are useful only as a protection from fire, are a source of great trouble and expense, and their use has been abandoned in iron ships. The flues or tubes may be variously arranged, the usual method being to place them above the furnaces, thereby returning the gases from the back connection or combustion-chamber to the front of the boiler, where they are discharged through the uptake into a common chimney; but they are sometimes placed so as to return at the sides of the furnaces, or, as in the locomotive boiler, extended beyond the furnace, in which case the flame passes directly to the chimney without change of direction. "Man-holes," of such size as to readily admit the body of a man for the purpose of cleaning and repairing, are provided in convenient positions; and "hand-holes," for removing scale and sediment, are placed at and near the bottom. These holes are covered by elliptical or triangular plates fitted from the inside, so that the steam-pressure has a tendency to tighten them.

The principal attachments to marine boilers are safety-valves, which automatically release the steam when the pressure exceeds a stated amount; steam-gauges for indicating the steam-pressure; stop-valves, which admit steam to the engine steam-pipe; feed check-valves for supplying the boiler with water; water-gauges for ascertaining the height of the water; salinometer-pots for determining the density of the water; reverse-valves for relieving the boiler from outward pressure when the steam-pressure falls below that of the atmosphere; blow-valves or cocks, connected with pipes passing through the bottom or sides of the vessel, for discharging the brine or super-salted water, or clearing the boiler of water altogether.

The number of boilers in a steamship varies from two to ten, depending upon the power required and the design of the boiler.

The cylindrical boiler is in universal use when compound engines are used, or when high pressure is required. The ends and back connections are the only parts requiring stays, the furnaces being cylindrical, and the whole structure is easily accessible for operations pertaining to cleaning, preservation, and repairs inside and out; and, although it occupies on the floor of the hold of the vessel more room than the rectangular-faced boiler, it will probably be the model type for many years to come. Boilers with vertical water-tubes are obsolete.

In the most successful marine boilers of the present day, the water surface exposed to the fire is not less than $1\frac{1}{2}$ square feet for one pound of coal consumed per hour; the diameter of the tubes not less than $3\frac{1}{2}$ inches, and their aggregate cross-sectional area not less than $\frac{1}{7}$ of the area of the grates. Such proportions will admit of a combustion of 20 pounds of semi-bituminous coal on each square foot of grate per hour, and will give an evaporation of about 9 pounds of water for each pound of coal. In the steamship "Gallia," of the Cunard line, about $9\frac{3}{4}$ horse-power was developed for each square foot of grate.—*Albert Aston*, *Chief Engineer U.S.N.*

Marine Steam-engine. A form of condensing steam-engine adapted to use on shipboard. The principal objects to be attained in the modification of the land engine to suit the changes of condition are, compactness, because the machinery necessarily occupies a portion of the most valuable space in the vessel; minimum weight consistent with proper strength; ready accessibility to all parts, and such structural arrangement that all the stress due to the power exerted, except the resultant thrust tending to move the vessel through the water, shall be supported within the machine itself without depending upon the vessel's hull as a foundation. Two or more cylinders, with their pistons connected with cranks placed at such angles as to enable the machinery to be started from any position, are generally adopted, though there are cases where single engines are in use. The two distinct classes of marine engines are the "screw-propeller engine" and the "paddle-wheel engine," the former having superseded the latter for all purposes except river or other light-draft navigation.

The types of engines best adapted to paddle-wheels are the "oscillating engine," the "direct-acting inclined" engine, and, for river service, the "American beam-engine." Side-lever engines are obsolete. For screw-propellers, "direct-acting," or "back-acting" engines, working either horizontally, inclined, or vertically, are in general use. The term "direct-acting" implies that the connecting-rod is extended *from* the cylinder to the crank, and "back-acting" that it returns *towards* the cylinder, immediately at the end of which the crank revolves. Oscillating engines are not adapted to screw propulsion, for the constantly varying moment of inertia of the principal moving parts, caused by the rapid transition of the piston and its attachments from one end of the stroke to the other, tends to create an abnormal stress that no mechanism can sustain; and the valve-gear is necessarily inconveniently complicated. Trunk-engines, and engines geared to the screw-shaft by cog-wheels, are no longer designed by modern engineers, the principal objections to the former being the inaccessibility of important parts and the loss in economic effect due to the radiating and friction-producing sur-

face of the trunk, and to the latter their excessive weight and lack of compactness.

In unarmored vessels of war it is essential that the machinery should be placed below the draft water-line of the vessel, to avoid danger from the shot of an enemy, therefore the cylinders are placed in a horizontal position, or with their axes slightly inclined thereto; but in vessels of the commercial marine, and armored vessels of war, modern experience has demonstrated that the "inverted cylinder" type, in which the cylinders are situated over the cranks, with their axes vertical, is the most successful arrangement. In this form, the friction and consequent wear due to the weight of the reciprocating parts is avoided, and the alignment of the machine readily preserved. These remarks are applicable whether the engines be single or double, plain or compound.

Surface-condensers are now considered indispensable to marine service. Although much heavier and more costly than jet-condensers, the economy due to restricting the use of salt water in boilers fully justifies their adoption. See CONDENSER.

Compound engines are growing into universal favor. They permit the expansion of steam to its utmost beneficial limit without the use of complicated machinery, and high-pressure steam can be used without subjecting the machinery to undue strains therefrom. Their great economy in the use of fuel is but little doubted. See COMPOUND ENGINE.

Vessels of war are frequently propelled by two screws, or "twin-screws," in which cases two independent sets of engines are provided. The principal object of this arrangement, which is accomplished by driving one screw ahead and the other back, is to secure facility in turning a vessel,—a quality of extreme importance in rams or vessels designed to fight "end-on." Twin-screws are also advantageous on light-draft vessels when a single screw of suitable diameter cannot be properly submerged. The weight, and space occupied by machinery, is, however, somewhat increased.

There is a great variety of types of steam-engine adapted to marine service, but the above mentioned include most of those in general use. —*Albert Aston*, *Chief Engineer U.S.N.*

Mariner. A sea-faring man of whatever rank. In early days the term *mariner* was confined to experienced seamen.

MARINER'S COMPASS. See COMPASS, THE MARINER'S.

Maritime. Bordering on, or situated near, the ocean. Pertaining to those who, or that which, border on the ocean. Relating to navigation and naval affairs. In some senses synonymous with *marine*.

MARITIME COUNTRY. A country bordering upon the sea.

MARITIME INTEREST. See BOTTOMRY.

MARITIME POWER. A state which possesses seaports and a navy to protect them.

Maritime Law is that system of jurisprudence which prevails in courts having jurisdiction of maritime causes.

It differs materially from both the civil and the common law in origin, history, and principles, unlike either it is not the outgrowth of the wants of any one nation, nor is it mainly the product of any one mind, nor is it the embodiment of the learning of any one age or of any one people, but it is, on the contrary, the result of the necessities of all, of a necessity experienced by each at a certain stage in its national development, and which, by reason of the universality and inherent justice of its principles, has so commended itself as to lead to its universal adoption.

It is founded on the practices of merchants, the principles of the civil law, approved compilations of maritime rights and usages, the writings of eminent authorities, and the adjudications of the admiralty courts of different countries. It is to the wants of commerce that maritime law owes its origin.

Rhodes was its birthplace, the Mediterranean its nursery, 900 years B.C. The inhabitants of this little island, then the centre of a flourishing commerce, gave to the world its first maritime code. The Rhodian code was subsequently adopted by the Romans, and was incorporated in the Pandects, and thus became the basis of maritime law as known to the ancients.

With the disruption of the Roman empire commerce almost entirely disappeared; and for some years the history of maritime law is buried in oblivion. With the revival of commerce came the re-establishment of consular courts, and the necessity for a system of jurisprudence by which to govern their decrees. The subsequent occurrence of the Crusades and the discovery of the compass gave to commerce an impetus far surpassing any which it had hitherto possessed. And this it was that gave rise to the maritime law of the Middle Ages.

Various maritime codes were promulgated in different parts of Europe, the Consolato del Mare, the laws of Oleron, the laws of Wisbuy, and the maritime ordinances of the Hanseatic League being those most worthy of note. The precise date of publication as well as the authorship of these various codes is doubtful. The question, however, is mainly of antiquarian interest. The laws of Oleron found their way to England in the time of Richard I., and formed the basis on which were decided the earliest cases in the High Court of Admiralty, and even during the present century, in the American courts, decisions have been based on the same authority.

The most noticeable of the maritime ordinances of modern times have been promulgated in France. The Ordinance de Marine, promulgated during the reign of Louis XIV., forms one of the most lasting monuments erected to the memory of that monarch.

Codes have continued to form the basis of the maritime law of continental Europe. Such, however, has not been the case with regard to either England or the United States; though there are points of divergence between the American and English maritime law, yet they are both based, not upon a code, but upon the custom of merchants, upon generally received authorities on maritime law, statutory enactments, and upon precedents established by judicial decisions.

Maritime law is a branch both of international and of commercial law. It is included in the former because it defines the rights, duties, and obligations of nations with respect to each other on the sea; it forms a part of the latter because

of the protection which it gives to individuals engaged in commerce, both as to their person and their property, whether the wrong be one sounding in tort or in contract; it defines the reciprocal rights and obligations of owners and masters, of masters and mariners, gives an adequate remedy to those engaged in supplying the necessities of ships, governs questions of salvage, general average, marine insurance, charter-parties, contracts of affreightment, etc.

For further information refer to Kent's Commentaries, Flanders's Maritime Law, Parsons's Admiralty and Shipping, Abbott on Shipping, Etting on Admiralty Jurisdiction in United States.—*Theodore M. Etting.*

Mark. Any object serving for the guidance of a ship; as, *sea-marks, land-marks*, etc. *Square-marks, sharp-up marks*, bits of twine on braces, lifts, etc., to serve as a guide in bracing, topping up, etc. In marking the lead-line the second, third, fifth, seventh, tenth, thirteenth, fifteenth, seventeenth, and twentieth fathoms are designated by bits of leather and differently-colored bunting. These divisions are called *marks;* the intermediate fathoms are estimated by the leadsman, and are called *deeps*, and in sounding the leadsman gives the result by singing out *by the mark*, 5, 7, 10, etc., or *by the deep*, 6, 8, 11, etc. The two expressions serve to distinguish the soundings even when the numeral part of it is not distinctly heard. The two expressions may be rendered more dissimilar by using *be* when the sounding given is a deep, and *by* when it is a mark; as, "*by* the mark," "*be* the deep." See LEAD.

MARKS AND DEEPS. When a youngster goes on board ship he is first taught the lead of the ropes, boxing the compass, and the *marks and deeps* of the lead-line. "To learn the ropes" and "to learn the marks and deeps" have become expressions signifying to become familiar with the fundamental principles of any subject, or with the inside working of any scheme or project.

Markab. The bright star *α Pegasi.*

Marl. To wind marline, spun-yarn, etc., around a rope, each turn being secured by a peculiar hitch; commonly done to secure the parcelling preparatory to serving.

MARLINE. Fine seizing-stuff, consisting of two yarns laid up left-handed; it is also used for serving.

MARLING-HITCH. A jamming half-hitch, in which the hauling part comes out underneath the standing part; used in marling down parcelling and in lashing up hammocks.

MARLING-SPIKE, or MARLINE-SPIKE. A pointed iron implement used to separate the strands in splicing, and as a lever in marling, putting on seizings, etc.

MARLING-SPIKE HITCH. A peculiar hitch through which the marling-spike is put in heaving taut a seizing.

Maroon. A name given in Jamaica and Dutch Guiana to a runaway slave. The term was first applied to slaves deserted by their masters, the Spaniards, when the British conquered Jamaica (1655).

MAROONING. A custom among former pirates of putting an offender on shore on some desolate cape or island, with a gun, a few shot, a flask of powder, and a bottle of water.

Marque, Letter of. See LETTER OF MARQUE.

Marquette, Jacques, one of the first explorers of the Mississippi. Born at Laon, France, in 1637; died May 18, 1675. Becoming a Jesuit at the age of 17, he sailed for Canada as a missionary in 1666. After passing about eighteen months at Three Rivers, in April, 1668, he founded at Lake Superior the mission of Sault Ste. Marie. In 1699, after a short stay at Lapointe, he followed the Hurons to Mackinaw, where, in 1671, he built a chapel at the mission of St. Ignatius, or Michilimacinac. In May, 1673, he accompanied Jolliet's expedition to explore the Mississippi, and after traveling in canoes over 2500 miles, returned in September. They proceeded to Green Bay, through Fox River to the Wisconsin, and thence by Portage to the Mississippi, which they descended to the Arkansas. Returning they ascended the Illinois, proceeded thence across to Lake Michigan and Green Bay, and to the mission without serious accident. During this expedition he prepared a map of the route. Having promised the Kaskaskia Indians to return and preach to them, after being detained a year by sickness, he set out in October, 1674, with two white men and a number of savages, for the village of Kaskaskia. After wintering at the Portage in the Chicago, he reached Kaskaskia, April 8, 1675, and at once began a mission by erecting an altar and celebrating the festival of Easter; but conscious that his end was approaching, he soon attempted to return to Mackinaw, but died near the mouth of a river on the east shore of Lake Michigan, which still bears his name. He was of a cheerful, joyous disposition, playful even in his manner, and universally beloved. His narrative was published at Paris in 1681, in Thevenot's "Recueil de Voyages." This account, as well as a journal of the missionary's last expedition, is in Shea's "Discovery and Exploration of the Mississippi Valley," New York, 1852.

Marrot. A name for the guillemot.

Marry. To place two ropes alongside of each other that both may be grasped and hauled on at the same time. To join two ropes end to end so both will pass through a block, as in reeving a new brace by the old one.

Marryat, Captain Frederick, R.N., an English novelist. Born in London, July 10, 1792; died August 2, 1848. His mother was the daughter of Frederick Geyer, of Boston. Entering the navy at an early age, he distinguished himself in several engagements, particularly in 1814, by cutting out four vessels in Boston Bay, and in an action with gunboats on Lake Pontchartrain. He also benefited the naval profession by the invention of his well-known code of signals. He commenced his literary career in 1829, producing a great number of sea-tales, among the best of which are "Peter Simple," "Midshipman Easy," "Percival Keene," etc. In 1837 he visited the United States, and on his return published his "Diary in America," which reflected somewhat severely on our national characteristics. This was followed by three additional volumes, and by his "Travels of M. Violet," supposed to be founded on the adventures of Chateaubriand in the woods of the New World.

Mars. The superior planet coming next in position to the earth. Mean distance from the sun, 145 millions of miles; diameter, 4500 miles;

apparent diameter, 4″ to 24″. Mars is distinguished by its red, fiery appearance. Symbol ♂, representing a shield and a spear.

Marsala, on the west coast of Sicily, is a strongly fortified seaport town inclosed by bastioned walls. Its ancient port was filled up in 1580 by Don John of Austria, and it now has an artificial port. Its importance is due to its wine trade, the district yielding annually about 30,000 pipes of wine, two-thirds of which are exported. It also exports corn, cattle, oil, salt, and soda. Pop. 34,000.

Marseilles, the most important seaport of France, is situated at the head of a finely sheltered bay, on the Gulf of Lyons, in lat. 43° 17′ 48″ N., lon. 5° 22′ 15″ E. It possesses a naval observatory, maritime syndicate, a first-class school of hydrography, a special school of commerce and industry, and many other institutions of importance. The harbor is one of the finest in France, perfectly secure in all weathers, with good anchorage for 1200 vessels in from 18 to 24 feet of water. It is strongly defended by two forts, the Tower of St. John and Fort St. Nicholas. Its foreign commerce exceeds that of every other port in France, and extends to all parts of the world. Pop. 318,000.

Marsiliana. A square-sterned Venetian ship of burden.

Marston, John, Commodore U.S.N. Born February 26, 1796. Entered the navy as midshipman, April 15, 1813; served on board the frigate "President," Commodore John Rodgers; "Washington," 74, Commodore Isaac Chauncey; frigate "Java," Commodore O. H. Perry; brig "Prometheus," Capt. Alexander S. Wadsworth; brig "Prometheus," Capt. William Bolton Finch; frigate "Constellation," Commodore Charles Morris; frigate "Constitution," Commodore Jacob Jones; frigate "Congress," Commodore James Biddle; frigate "Brandywine," Commodore Charles Morris, when she took La Fayette to France, and afterwards in the Mediterranean; frigate "Brandywine," Commodore Jacob Jones, in the Pacific Ocean; schooner "Dolphin," Capt. John H. Aulick; sloop "Vandalia," Commodore John D. Henley; frigate "United States," Commodore Lawrence Kearney; frigate "Potomac," Capt. George W. Storer; sloop "Yorktown"; sloop "Cumberland," at the bombardment of Hatteras; steam-frigate "Roanoke,"—commanded at Hampton Roads in that ship when the "Merrimac" came down from Norfolk, Va.; in addition to this, a variety of service performed at the Portsmouth and Philadelphia Navy-Yards.

Promoted from a midshipman, July 13, 1825, to a lieutenant.

Promoted from a lieutenant to a commander, September 8, 1841.

Promoted from a commander to a captain, September 14, 1855.

Promoted from a captain to a commodore, July 16, 1862.

Retired December 21, 1861.

Martello Towers. So named from a tower in the bay of Mortella, in Corsica, which, in 1794, maintained a very determined resistance against the English. A martello tower is built circular, with walls of vast thickness, pierced by loop-holes, and the bomb-proof roof is armed with one heavy traversing gun. They are 30 to 40 feet high, surrounded by a dry fosse, and the entrance is by a ladder at a door several feet from the ground. The following is also given as the origin of the name: "When piracy was common in the Mediterranean, and pirates made plundering descents upon the coasts, the Italians built towers near the sea, in order to keep watch and give warning if a piratical craft was seen to approach the land. The warning was given by striking a bell with a hammer; hence these towers were called *Torri da Martello.*"

Martial Law. Anciently, in England, this term meant the law military. It was not a fixed and permanent code, but a body of regulations which the king, preparatory to actual war, composed, with the advice of the constable and marshal, who were high ministerial officers of the king, and which was administered by the Court of Chivalry, of which the constable and marshal were the constituent members. With the decadence of the Court of Chivalry martial law lost whatever character for regularity of administration it had possessed, and was dispensed by councils of war, commissions, and courts-martial, so called. Being defined by no written statute, its exercise was capricious and tyrannical, and it became an instrument of oppression in the hands of arbitrary sovereigns, who extended its operation to non-military as well as military persons, and to times of peace as well as of war. In the reign of Charles I. its abuse had become so great that the king was compelled by the Commons to give his assent to the bill which they had prepared, called the Petition of Right, one clause of which provided that the commissioners for proceeding by martial law should be dissolved and annulled, and that no such commission should be issued for the future. Under the Commonwealth martial law became somewhat more systemized than it had previously been, but it was not till the passage of the Mutiny Act, April 3, 1689, that there existed in England a regularly enacted statute for the government of the military state. (See MUTINY ACT.) From the passage of this act dates what is now properly understood as military law (which see). It is to be regretted that more care has not been taken by writers on law to distinguish between martial law and military law, as much of the opprobrium which is justly visited upon the former, on account of its capricious and arbitrary character, has come, by reason of such want of discrimination, to attach to the latter.

Sir Matthew Hale, in his history of the Common Law, observes of martial law, that "in truth and reality it is no law, but something indulged rather than allowed as law"; and the Duke of Wellington has defined it as "the will of the general who commands the army." A more expanded definition is given by an English authority as follows:

"Martial law is the suspension of all law but the will of the military commanders intrusted with its execution, to be exercised according to their judgment, the exigencies of the moment, and the usages of the service, with no fixed or settled rules or laws, no definite practice, and not bound even by the rules of the military law."

Martinet. A rigid disciplinarian, but one who, in matters of inferior moment, harasses all under him. An old word for *leech-line.*

Martingale. Ropes or chains from the ends

of jib- and flying jib-boom, to assist in counteracting the strain of the head-stays.

MARTINGALE BACK-ROPES. Ropes or chains from the dolphin-striker and setting up at the bows.

Martin's Shells. An incendiary shell lined with loam and hair and filled with molten iron.

Mascaret. A peculiar movement of the sea near Bordeaux in summer at low-water.

Masoolah Boat. See MASULAH BOAT.

Master. A line-officer of the grade next below that of lieutenant; he ranks with a first lieutenant in the army. He may be ordered to duty as navigator or watch officer, and messes in the ward-room. See NAVIGATOR, WATCH-OFFICER.

Master. The officer commanding a merchantman. His duties comprise the maintenance of discipline, the handling and navigation of the ship, the direction of the internal arrangements and economy of the ship, and the proper stowage of the cargo. To him great powers are confided and upon him great responsibilities rest. His legal rights, duties, and remedies in regard to owners, shippers, passengers, and crew are regulated by special statutes, by agreement with the owners, and by the customs of the sea.

In different ships different methods obtain of manning and provisioning the vessel. In some cases the master makes out an inventory of the stores required and they are accordingly supplied by the owner's order; in others the owners put the provisions on board with directions, more or less liberal, as to the manner in which the master is to dispense them. Usually the shipping of the crew is left to the shipping-masters, who are responsible for their appearance on board at the time of sailing; in other cases, the master, or perhaps the owner, selects his men himself.

Before sailing, the duties of the master (unless also supercargo) are mostly confined to looking after the outfit of the vessel and seeing that she is in sea-going trim. Everything being in readiness, the custom-house and other regulations complied with, the vessel is put under charge of the pilot to be taken clear of the land. While the pilot is on board the master has little else to do than to see the orders of the pilot carried out; when the pilot is discharged, the entire control and responsibility is thrown upon the master; he does not keep a watch, but is to be called whenever circumstances require it. The entire control of the navigation lies with him, though he may call upon his officers for assistance if necessary. He has a power and influence, both direct and indirect, which may be the means of much good or much evil.

Master, or Sailing-master. Formerly, the officer who did the duties now required of the navigator. See NAVIGATOR.

MASTER'S DIVISION. The division of the men stationed at the wheel, in the chains, tops, etc., and who are under the immediate direction of the navigator. The navigator's division.

Master-at-arms. The chief petty officer of a man-of-war. With his subordinates he attends to the police duties of the ship, prevents the smuggling of liquor, quells all disturbances, arrests all disorderly persons, keeps a vigilant watch over the conduct of the men, exercises supervision over all lights and fires, and has special charge of all men in confinement. In early days he instructed the crew in the use of small-arms.

Master-attendant (*Eng.*). An officer in the royal dock-yards appointed to assist in the fitting or dismantling, removing or securing vessels of war, etc., to inspect the moorings in the harbor, to visit all the ships in ordinary, and to attend at the general musters in the dock-yard, taking care that all the individuals registered in the navy-book are present at their duty.

Master Mariner. The shipmaster or captain of a merchant vessel.

Master of Misrule. An officer of an hour or two when the hands were piped "to mischief." The lord or abbot of misrule on shore has immemorially been a person selected to superintend the diversions of Christmas. In these "larks," however, malicious mischief was unknown.

Master's Mate. In early days an officer who assisted the master in his duties in the hold, on the decks, etc.,—generally a midshipman or passed midshipman. See MATE.

Masting. The determination of the position in which the masts of a vessel should be placed, and the mechanical process by which they are placed in position.

The first part of the definition is one of the problems of naval construction, full explanations of which can be found in works upon that subject.

The position in which the masts should be placed varies with the number with which a vessel is to be furnished, the rig, and, in some degree, upon the model. The object to be attained is to place the masts so that the centre of effort of the sails will be at a certain point depending upon the centre of lateral resistance of the vessel. The latter point varies with the trim of the vessel; but in a vessel that is perfectly balanced under sail with the wind on the beam, the centre of effort of sail is directly over the centre of lateral resistance.

By reason, however, of the pressure of the water in the lee bow when the vessel is in motion, the shape of the bow, the length of the middle body, heeling of the vessel, strength of wind, etc., the vessel has the tendency to fly into the wind,—called *ardency*,—which must be corrected by moving the centre of effort of the sails a sufficient distance forward of the centre of lateral resistance. The result, in a small degree, may be obtained by raking the masts forward or aft; but, as a general rule, the centre of the effort of the sails should be placed one-twentieth of the length of the water-line forward of the centre of lateral resistance.

In the masting of steam-vessels this rule cannot always be followed, on account of the necessary position of engines and boilers, and in steam-vessels where the sail-power is merely auxiliary, the placing of the masts by this rule is of less importance, as the sails are merely designed to steady the vessel in a rough sea without adding materially to the speed, or to keep her to the wind when hove to.

The mechanical operation of placing the lower-masts is the work of the seaman, and is performed by means of sheers or a derrick, under which the vessel is hauled, or by sheers rigged on the deck. In the former case either mast may be stepped first, the vessel's position being changed as required in order that the main purchase may plumb the mast-hole.

When a vessel is to be masted without the aid

of permanent sheers, they must be constructed on board the vessel. The deck must first be supported by shores placed under that part where the sheers are to stand.

Heavy spars, such as lower yards or topmasts, should be selected, and these may be strengthened by lashing lighter spars to them. The spars are placed in position one on each side of the deck, with their heels a little forward of the partners and a few feet from the vessel's side. The heads of the spars are crossed amidships, forming the sheer-head, and are lashed in such a manner that by spreading the legs of the sheers the lashing is tightened. The upper block of the main purchase is secured to the sheer-head by a lashing, which passes over the sheer-head lashing and allows the block to hang under the cross, while the upper block of the small purchase is lashed to the after fork of the sheers. Blocks are also lashed to the forks through which girtlines are rove, and guys are placed at the sheer-head and near the middle of the legs to support them, and retain them in position. Under the heels heavy shoes of plank should be placed, and the heels must be securely lashed to prevent them from slipping forward while the sheers are being raised. The sheers are raised by means of the main purchase and capstan, and if necessary a single spar may be used as a derrick to assist in starting the sheer-head.

If all of the lower-masts and the bowsprit are to be taken in, the mast nearest to the stern should be stepped first, as in transporting the sheers from the narrower to the wider part of the deck the sheer-legs will be spread and the sheer-head lashing tightened. Also, when the sheers are raked over the bow, as is required in getting in the bowsprit, they can be better supported if the foremast has been previously stepped.

The mast having been placed alongside with the head aft, the lower block of the main purchase is toggled to the garland, or large selvage strap, which is lashed to the mast at a sufficient distance from the heel to cause it to hang heel-heavy. The garland for the small purchase should be lashed as far above the larger as there is distance between the upper blocks of the two purchases. The mast is then raised by means of the capstan, eased inboard by guys as it comes above the rail, and lowered into its place, using the two purchases for sluing and pointing the mast as desired.

In stepping the other masts the same process is repeated, the sheers having first been transported to a new position.

For a more minute account of masting and sending aloft topmasts, topgallant-masts, etc., works on seamanship should be consulted.

Boat's masts are placed in accordance with the principles already stated, but great precision is not as necessary, as the balance of sail can be easily obtained within certain limits by trimming the boat with the weights on board, and thus changing the centre of lateral resistance as required. Care should, however, always be taken to retain the *ardency* of the boat, as with the wind abeam or close-hauled its pressure on the sails can be quickly lessened by a movement of the helm.

The number of the masts and the rig depends upon the service that is required, but in general those for ship's boats should combine strength with lightness, in order that they may carry the sail with safety and be easily handled by the crew; they should be sufficiently short to allow of being stowed snugly in the boat when not in use, and there should be a sufficient number to give to the boat the requisite amount of sail.—*E. T. Strong, Lieutenant U.S.N.*

Masts. The upright spars which are placed in a vessel to support the yards, gaffs, and booms upon which the sails are spread.

Masts are named from the position in which they are placed. In a vessel with two masts that nearest the bow is called the foremast, and the other the mainmast. When there are three masts they are named the fore-, main-, and mizzen-masts, and with four masts that nearest the stern is called the spanker-mast. In vessels of small size and simple rig each mast may be made from a single spar, but vessels of larger size and of a more complicated rig require the masts to be made in sections on account of the great difficulty in obtaining spars of sufficient length, the inconvenience in handling them, and the necessity of being able to send down the upper parts of the mast and leave the lower in position. These sections in a square-rigged mast are named the lower-mast, topmast, topgallant-mast, and royal mast. With masts fore-and-aft rigged there are but two sections, the upper one being called the topmast.

The lower-masts are stepped upon the keelson, and extend to a certain height above the upper deck, depending upon its position in the vessel, the rig of the vessel, and whether moved by steam or sails. Square-rigged sailing-vessels have comparatively shorter lower-masts than those of fore-and-aft rig, as the latter require them of greater length in order to accommodate the lower sails. The principal parts of the lower-mast are the heel, which rests upon the keelson; the partners, which are at the height of the deck where the mast is wedged; the hounds, or shoulders, where the head commences and upon which the trestle-trees rest; the head, which is that part above the hounds; and the bibbs, which are fitted pieces of timber bolted to the sides of the mast with their upper edges level with the hounds and giving additional support to the trestle-trees. The bibbs also strengthen the mast in that part which is most liable to strain and injury.

Lower-masts for small square-rigged vessels, and for all those of fore-and-aft rig, are made from a single spar, and are called single-tree masts. For large vessels the lower-masts are composed of several pieces united by dowels and hooped, and are called made-masts. These are stronger and more durable than single-tree masts and less liable to be defective.

The topmast is stepped forward of the lower-mast head, and its weight is sustained by the fid, which, passing through the fid-hole in the heel, rests upon the trestle-trees. The topmast also passes through the round hole of the cap which is placed on the lower-mast head, and that part of the two masts between the trestle-trees and the cap is called the doublings of the mast.

Platforms of semicircular shape, called tops, are placed over the lower-mast heads previous to stepping the topmasts and placing the caps, and rest upon the trestle-trees. The maintop is equal in breadth to half the breadth of beam,

while the fore- and mizzen-tops are proportionally smaller. Being secured on the underneath side to the mast below the bibbs, the topmast shrouds are set up to the rim on each side and give lateral support to the mast.

The topmast head is similar in construction to the lower-mast head. The hounds support the trestle-trees upon which the fid of the topgallant-mast rests, and the head of the topmast is surmounted by the cap through the round hole of which the topgallant-mast passes. Each mast is secured in position by shrouds, stays, and backstays independently of each other, so that the upper-mast can be sent down without disturbing the security of those below it.

To ascertain the dimensions of the several masts of a vessel, both as compared with the size of the vessel and with each other, works on shipbuilding should be consulted.

Timber for masting should be not only strong and durable, but also light and elastic. These qualities are found in the cone-bearing trees, as the pine, spruce, fir, etc.

The timber is principally obtained from the forests of Maine, Oregon, Canada, and the northern countries of Europe. Great care is required in its selection. The trees should be of sufficient age and well charged with resin, which gives strength to the wood and preserves it from insects and premature decay. After the timber is felled care is required in its preservation, and to this end the rough spars are buried in mud, or submerged or floated in wet-basins, where they are protected from changes of temperature.

Masts of iron have been constructed to some extent, but its use is confined principally to vessels of that material, as steamers, where extreme length of mast is not required. Iron lacks the elasticity and flexibility which is found in wood, and for that reason is not likely to come into general use. There are, however, some considerations in its favor, such as strength and durability, cheapness in localities where iron abounds, purposes of ventilation, and the facility with which masts of required dimensions may be constructed.

A jury-mast is a temporary mast constructed from such masts or spars as may be at hand to replace one that has been injured or lost by stress of weather or during an engagement.—*E. T. Strong*, *Lieutenant U.S.N.*

MAST-COAT. A canvas covering setting close over the wedges and partners of a mast to keep water out.

MAST-HEAD. The part of a mast above the hounds. *To mast-head*, to hoist up, or send up, to the mast-head; a well-known punishment for midshipmen.

MAST-HOLE. An aperture in a thwart of a boat or deck of a ship to receive a mast when it is stepped.

MAST-HOOPS. Iron hoops on a made-mast.

MAST-ROPE. A heavy rope used in swaying up or striking a mast.

Masulah, or Masoolah Boats. Madras boats, of which the planks are sewed together with coir-yarn, crossing the stitches over a wadding of coir or straw, which presses on the joints and prevents much leakage. The vessel is thus rendered pliable, and yields to the shock on taking the ground in the surf, which at times runs from 10 to 16 feet high. They are rowed by 12 men in double banks, with oars formed by an oval piece of board lashed to the end of a rough piece of wood. They are guided by one man with a long steering-oar, who stamps and yells with excitement as he urges the men to pull when a rolling surf is coming up astern. These boats are from 30 to 35 feet in length, 10 to 11 feet in breadth, and 7 to 8 feet in depth.

Mat. To prevent chafing a thick mat is woven from strands of old rope, spun yarn, or foxes, containing a number of rope-yarns in proportion to the size of the mat to be made. The largest and strongest kinds are called *paunch-mats.* The *thrum-mat* is similar to the cocoa-nut fibre door-mats. Where it is possible rounding is used instead of mats, it being neater and holding less water.

Matanzas, on the northwest coast of the island of Cuba, in lat. 23° 3′ N., lon. 81° 40′ W., is a fortified seaport town, and in commercial importance ranks next to Havana. The imports consist chiefly of articles of food, machinery, and materials for sugar and coffee plantations. Among the exports are sugar, coffee, molasses, tobacco, honey, wax, and fruits. The bay is spacious, easy of access, and completely sheltered from winds except those from the northeast, which bring in a heavy swell. Pop. 36,000.

Match. A *slow-match* is a loosely-twisted cord dipped in a solution of lime-water and saltpetre; it burns 4 to 6 inches per hour. A *quick-match* is cotton-wick saturated with a composition of mealed powder, gum, and spirits; it burns about three inches per second.

MATCH-STAFF. A pointed staff with a slit in the upper end; used to hold the slow-match.

MATCH-TUB. A conical tub about 18 inches in height, with a sunken head perforated with holes, in which the slow-match was hung.

Mate. A line-officer in the navy not in the line of promotion. He holds his position by appointment, messes in the steerage, and may be ordered to do duty in the boats, as mate of a deck, or such other duty as the commanding officer prescribes. The term is also applied to the assistant of the boatswain, gunner, armorer, etc.; and it also means an equal or partner; as, messmate, shipmate, etc.

Mate, Chief. The officer next in rank to the master of a merchantman. He is the active superintending officer carrying out the ideas and orders of the master. While in port the chief mate has more control of the vessel than when at sea, the master being generally engaged in transactions with the merchants and owners on shore. The chief mate has the charge of receiving, stowing, breaking out, and discharging of cargo, and is in command of the ship during the absence of the master. At sea the chief mate has command of the port watch; when all hands are called the master takes charge, and the mate is stationed on the forecastle. He is also intrusted with keeping the log. He is considered a confidential person to whom the owners, shippers, and insurers look for special duties and qualifications; the master, therefore, cannot remove him from office except under peculiar circumstances, and then must be able to prove a justifiable cause. The law makes the chief mate the successor to the master in case he should die or be unable to perform the duties of his office, and this without any action on the part of the

crew. It is, therefore, important that he should have a sufficient knowledge of navigation to take the ship to her destination.

Mate, Second. The second mate commands the starboard watch at sea, but when all hands are called on deck he leads the crew in their work, taking the weather earing in reefing and furling the bunts of the topsail and courses. He ought to have a good knowledge of marline-spike seamanship, as he is expected to attend to the most difficult of jobs in that line. In port the boat-duty falls to his lot, and in receiving and discharging cargo his station is in the hold.

Mate, Third. Merchant vessels bound on long voyages sometimes carry a third mate, but this is so unusual that his duties have not become settled by custom. He belongs to the port watch; he takes the bunt and the weather earing forward as the second mate does aft, and in port does a part of duty which would be otherwise allotted to the second mate.

Mates of Decks, Hold, and Hull. Junior officers who are responsible for the condition of decks, hold, or hull, and superintend all work done within their limits.

Mathemeg. A fish of the cod kind, inhabiting Hudson's Bay.

Maties. Dock-yard artificers, shipwrights, carpenters, etc.

Mato. A shell formerly of some commercial value on the west coast of Africa.

Matthew Walker. A knot, so termed from the originator. It is formed by a half-hitch on each strand in the direction of the lay, so that the rope can be continued after the knot is formed, which shows as a transverse collar of three strands. It is the knot used on the end of the laniards of rigging where dead-eyes are employed.

Maud. A salmon net fixed in a square form by four stakes.

Maund. An Indian weight, which varies in amount, depending on the part of the country. Also, a basket used by fishermen; a measure of small fish.

Maunjee. The native boatmen of the river Hooghly.

Maury, Matthew Fontaine, LL.D., naval officer and hydrographer. Born in Spottsylvania County, Va., January 14, 1806. While he was young his parents removed to Tennessee. Midshipman, February 1, 1825, and while circumnavigating the globe in the "Vincennes" began his treatise on "Navigation." Lieutenant, June 10, 1836. In 1839 he met with an accident which resulted in permanent lameness and unfitted him for active service afloat. While confined from this cause he amused himself by writing a series of articles on various abuses in the navy, published in the *Southern Literary Messenger*, entitled "Scraps from the Lucky Bag, by Harry Bluff." He was then placed in charge of the Hydrographical Office, and on its union with the Naval Observatory, in 1844, he became superintendent. He investigated the physical geography of the sea, and gathered many observations of the ocean winds and currents from the records of naval and merchant vessels. In 1844, Lieut. Maury's paper respecting the Gulf Stream, ocean currents, and great circle sailing was read before the National Institute, and printed in the *Southern Literary Messenger*. The principal results of his researches are embodied in the wind and current charts and the sailing directions published by the Observatory for general distribution among mariners, and in the "Physical Geography of the Sea" (New York, 1855). In 1855 he was made commander, and in 1861 threw up his appointments and joined in the Rebellion. Resigned the presidency of the University of Alabama in 1871. Member of the principal scientific associations of America and Europe, from whom, as well as from foreign governments, he has received distinguished honors. He has beside the above published "Letters on the Amazon, and the Atlantic Slopes of South America," "Relation between Navigation and the Circulation of the Atmosphere," "Astronomical Observations," 1853, and also several addresses before literary and scientific bodies.

Mavis Skate. The sharp-nosed ray.

Maw, or **Sea-maw.** The common gull, *Larus canus*.

Mayaguez is the third town of importance of the island of Porto Rico. It has a very good harbor, and the exports and imports have each exceeded $3,000,000 in a year. Sugar, molasses, coffee, hides, fruit, and turtle-shell are leading exports. Pop. 12,000.

Maze. In the herring trade, 500 fishes.

Mazolet. An Indian bark-boat, calked with moss.

McCawley, Charles G., Colonel U.S.M.C. Born in Pennsylvania. Appointed from Louisiana.

Commissioned as second lieutenant, March 3, 1847; in June, ordered to join battalion of marines for service with army in Mexico; participated in the storming of the castle of Chapultepec and taking of the city of Mexico; brevetted first lieutenant for gallant and meritorious conduct in these actions, September 13, 1847; in August, 1848, was ordered for duty at marine barracks, Philadelphia; December, 1848, marine barracks, Boston; July, 1849, "Cumberland," Mediterranean Squadron; March, 1850, at Naples, to razee "Independence"; August, 1852, marine barracks, Philadelphia; June, 1853, "Princeton," Home Squadron.

Promoted first lieutenant, January 2, 1855; July, 1855, marine barracks, New York; December, 1855, marine barracks, Boston; July, 1857, "Mississippi"; detached, and ordered to Philadelphia; December, 1857, "Jamestown," at Philadelphia, for Home Squadron; March, 1860, marine barracks, Philadelphia; December, 1860, "Macedonian," Home Squadron, Atlantic coast, West Indies, and Spanish Main; January, 1862, marine barracks, Boston; detached immediately, and ordered to join battalion of marines at Bay Point, S. C.; April, 1862, returned with battalion to Washington.

Received commission as captain, July 26, 1861; ordered in command at headquarters; May, 1862, ordered with detachment of 200 men to reoccupy the Norfolk Navy-Yard; hoisted the flag again on the part of the navy; October, 1862, ordered to headquarters, Washington, D. C.; in command until July, 1863; ordered to join battalion of marines, for service in South Atlantic Squadron; served with same on Morris Island during bombardment and destruction of Fort Sumter, and capture of Forts Wagner and Gregg; commanded a detachment of 100 men and officers in

the boat attack on Fort Sumter, September 8, 1863; received a brevet as major for gallant and meritorious conduct in this action; served on Folly Island; and in December, 1863, battalion returned to Philadelphia; marine barracks, Philadelphia.

Promoted major, June 10, 1864; ordered to marine rendezvous, Philadelphia; March, 1865, ordered to command marine barracks, Boston.

Promoted to lieutenant-colonel, December 5, 1867; August, 1871, ordered to command marine barracks, Washington, D. C.; June, 1872, appointed superintendent of recruiting, in addition to other duty ordered to New York to attend to organizing the recruiting service; returned to Washington, November, 1872.

Promoted colonel commandant of the U. S. marine corps, November 1, 1876.

McClintock, Sir Francis Leopold. Born at Dundalk, Ireland, in 1819. Entered the British navy in 1831, at 12 years of age; accompanied Sir John Ross's Arctic Expedition in 1848, and Capt. Austin's expedition in 1850 in search of Sir John Franklin as a lieutenant. Promoted to commander in 1851, and accompanied the expedition of Sir Edward Belcher, which rescued Capt. McClure, who had been imprisoned for three years by the ice near Melville Island; in 1857 he was sent by Lady Franklin in command of the "Fox" in search of Sir John Franklin, and had the satisfaction of proving that Sir John had made a discovery of the northwest passage communicating with the Pacific, and also ascertained the positive fate of Sir John and his expedition; for this he was knighted in 1860. In October, 1871, he was promoted to rear-admiral, and in 1872 was made superintendent of the Portsmouth dock-yard. Promoted to vice-admiral, August 5, 1877.

McDonough, Thomas, Commodore U.S.N., was born in New Castle, Del., December, 1783. He was appointed a midshipman in 1800. He sailed in the "Philadelphia," Capt. Bainbridge, arriving off Tripoli August 24, 1803. When that ship was captured, he was absent in a prize, and did not suffer captivity. He was then sent to the "Enterprise" with Decatur, and was engaged in the destruction of the "Philadelphia" in the ketch "Intrepid." He was engaged in the attacks of August 3 and September 28, particularly distinguishing himself in the former. In 1806 he was a lieutenant in the "Siren" under Stewart, and was very intrepid in protecting American seamen from imprisonment.

In January, 1806, he was promoted to lieutenant. He was sent to command the forces on Lake Champlain in the summer of 1812. In 1813 two ships of his small squadron were captured, but it was increased the following year, and on the 11th of September, while at anchor near Plattsburg, he was attacked by an English squadron of 4 ships and 13 galleys, but by consummate ability and seamanship, particularly in anchoring his ships, he defeated the enemy with his squadron of 4 ships and 11 galleys, after a long and bloody battle. He was wounded slightly. Received a medal, 100 acres of land from the State of Vermont, and was promoted to captain, September 11, he having been already promoted to master commandant, July 20, 1813. From 1816 to 1818, he was attached to the navy-yard, Portsmouth, N. H. From 1819 to 1821, he was in command of the frigate "Guerriere" in the Mediterranean. He was then in command of the "Ohio," 74, in ordinary at New York Navy-Yard, and in 1825 he went again to the Mediterranean, flying his flag on the frigate "Constitution." He died of consumption, while on his way home in her, November 10, 1825, aged 42.—*F. S. Bassett, Lieutenant U.S.N.*

McDougal, David D., Rear-Admiral U.S.N. Born in Ohio. Appointed from Ohio, April 1, 1828; sloop "Natchez," West India Squadron, 1829–31; frigate "Brandywine," Mediterranean Squadron, 1832–35.

Promoted to passed midshipman, June 14, 1834; navy-yard, New York, 1835–36; sloop "Natchez," West India Squadron, 1837–39; brig "Consort," coast survey, 1840–43.

Commissioned as lieutenant, February 25, 1841; navy-yard, New York, 1843–44; steamer "Michigan," on the lakes, 1845–46; sloop "St. Mary's," 1846; attached to steamer "Mississippi," at the capture of Vera Cruz; brig "Bainbridge," 1848–50, coast of Africa; steamer "Michigan," on the lakes, 1852–54; commanding store-ship "Warren," 1855–57.

Commissioned as commander, January 24, 1857; navy-yard, Mare Island, Cal., 1859–60; commanding steam-sloop "Wyoming," Asiatic Squadron, 1861–64; while in command of the "Wyoming," engaged 6 batteries and 3 vessels of war, at Simonsaki, Japan, July 16, 1863, sinking a brig and exploding the boilers of a steamer, with a loss of 11 killed and wounded on the "Wyoming."

Commissioned as captain, March 2, 1864; commanding navy-yard, Mare Island, Cal., 1865–66; commanding steam-sloop "Powhatan," South Pacific Squadron, 1868–69.

Commissioned as commodore, 1869; commanding South Squadron, Pacific Fleet, 1870–72; retired, December 27, 1871.

Commissioned as rear-admiral, September 27, 1873.

McKean, William, Commodore U.S.N. Born in Pennsylvania, in 1801; died near Binghamton, N. Y., April 22, 1865. Son of Judge McKean. Midshipman, November 30, 1814; lieutenant, January 13, 1825. Commander, September 8, 1841; captain, September 14, 1855; commodore, July 16, 1862; governor of Naval Asylum, 1858–61; retired, July 16, 1862. Commanded a schooner in Porter's West India Squadron, 1823–24, and active in suppressing piracy there. In 1860 on special service of conveying the Japanese Embassy home, and on his return was for a short time in command of the West Gulf Blockading Squadron.

McKeever, Isaac, Commodore U.S.N. Born in Pennsylvania, April, 1793; died in Norfolk, Va., April 1, 1856. Midshipman, December 1, 1809; lieutenant, December 9, 1814, and commanded a gunboat in the flotilla of Lieut. Jones, which was captured by the British on Lake Borgne, La., December, 1814. In the engagement, which was very warm, he was severely wounded. In the galliot "Sea-Gull," in 1825, aided by some boats of the British frigate "Dartmouth," he, after a sharp fight, captured two pirate schooners. May 27, 1830, he was made a commander, and a captain in December, 1838. He commanded the squadron on the coast of Brazil in 1851–54.

Mealed Powder. See POWDER.

Mean. A term implying medium; average.

MEAN NOON. See NOON.

MEAN SUN. A fictitious sun which is conceived to move uniformly in the equinoctial with the mean velocity that the true sun has in the ecliptic.

MEAN TIME. See TIME.

Meck. A notched staff in a whale-boat on which the harpoon rests.

Medical Corps of U. S. Navy. The active list of the medical corps of the navy consists of 15 medical directors, ranking with captains; 15 medical inspectors, ranking with commanders; 50 surgeons, ranking with lieutenant-commanders or lieutenants; and 100 passed assistant and assistant surgeons, ranking with lieutenants, masters, or ensigns, according to length of service.

Assistant surgeons enter the service after examination by a board of medical officers, and at the completion of two years' sea-service are subject to another thorough examination, which is competitive, and which determines their permanent place upon the register.

The surgeon-general is selected by the Secretary of the Navy, and appointed by the President from among the senior medical officers, and is commissioned for four years, by and with the advice and consent of the Senate. The surgeon-general is chief of the Bureau of Medicine and Surgery in the Navy Department, and has charge of all matters pertaining to the medical outfit of vessels, to naval hospitals, and to the naval laboratory; the detailing of medical officers for service; and all papers and records pertaining to the medical department, as well as the expenditure of all moneys for the purchase of supplies and for the maintenance of hospitals. See MEDICAL OFFICERS, DUTIES OF.—*E. Shippen.*

Medical Officers of U. S. Navy, Duties of. *Surgeons of the fleet*, who are usually medical inspectors or senior surgeons, are to exercise supervision over all medical officers serving under them, and from time to time to inspect their journals, abstracts, instruments, dispensaries, and store-rooms. The fleet-surgeon is also to assure himself of the correctness of all medical reports and returns, and indorse as approved all certificates of death or disability, and reports of survey, before forwarding them to the Bureau of Medicine and Surgery.

He also examines and approves all requisitions for medical and hospital stores for the fleet or squadron, and inspects their quality. On foreign stations he purchases these supplies, or selects them from the naval store-house, making requisitions therefor, as far as possible, at regular periods.

He makes and transmits to the Bureau of Medicine and Surgery records of the character and treatment of diseases occurring in the fleet or squadron. He is also to suggest measures for the preservation of health in the fleet.

On the probability of an engagement he is to assure himself that the medical department of every ship is prepared for the treatment of wounded; and after battle will make to the commander-in-chief, and to the bureau, a summary report of casualties. He is also to forward to the bureau an aggregate report for each quarter, comprising all diseases in the squadron, with a summary of bills incurred, and an epitome of the remarks of medical officers in cases likely to give rise to claims for pension.

General Duties of Naval Medical Officers.—The senior medical officer of every naval station and of every vessel in commission shall keep, or cause to be kept by a medical officer subordinate to him, the following official records, viz.:

A *list of patients*, with complete description of person, details of and final disposition of each case. This is to be embodied in a quarterly report.

A *medical journal*, with complete description of person, and history of cases, properly indexed.

A *yearly abstract of patients*,—a concise, alphabetical record of every case of injury or disease occurring in the navy, with full personal description, and whether occurring in the line of duty or not.

A daily *report of sick*,—made every morning to the commanding officer, in a sealed envelope.

A daily *binnacle list*, of all persons excused from duty.

Whenever a patient is transferred from the charge of one medical officer to that of another, he must be accompanied by his effects, with a list thereof upon a *hospital ticket*, which ticket gives a description of the person, and all facts in the case, as well as the origin of the disability,—whether in line of duty or not.

A *report of sick* is made *quarterly* to the surgeon of the fleet, or to the Bureau of Medicine and Surgery, and with it are forwarded triplicate receipts for articles obtained from public stores during the quarter, and a triplicate of all bills paid; a daily record of atmospheric observations, and, on April 1 and October 1, requisitions for supplies for the next six months. Medical officers of cruising vessels are required to note on this quarterly report of sick the ports visited, and the number of days at sea and in port during the quarter.

Certificates of disability, and *certificates of death*, and all other papers interesting to parties claiming pensions, are to be forwarded without delay, through the proper channel, to the surgeon of the fleet or to the bureau direct.

The senior medical officer is to prepare his own receipts and returns; and if relieved, is to leave to his successor all necessary official papers, taking a receipt for them in duplicate.

At shore-stations, hospitals, and receiving-ships the senior medical officer is required to make, on July 1 of each year, an *inventory* of all property in his charge, which inventory is to be transmitted to the Bureau of Medicine and Surgery.

The senior medical officer of every vessel and station is required, on each 1st of January, to make a *sanitary report* to the bureau, embracing *hygiene*, *climatology*, and *medical topography* of all places visited, with all attainable information respecting statistics of disease and its causes, medical schools, hospitals, charitable institutions, etc.

By law, all spirits on board ship are to be under the charge of the senior medical officer, and issued only on his prescription.

Assistant surgeons, candidates for promotion, must present to the Board of Examiners testimonials of proper habits from the medical officers with whom they have been associated on

duty, and a medical journal in the candidate's own handwriting. Also observations upon the hygiene of vessels and stations to which they may have been attached, and upon medical topography, hospitals, and other matters of professional interest.

Passed assistant and assistant surgeons, when in separate charge, will be governed by the same instructions as surgeons.

Director of the laboratory will receive timely notice of the probable force to be kept afloat, and for this and other current wants will keep in hand, by manufacture or otherwise, an adequate stock of the articles enumerated in the supply table. Accurate invoices, inventories, and receipts are required in receiving supplies from the laboratory, or in returning them, after a vessel has been put out of commission; at which time a final return of property is also to be made to the bureau. When medical stores are publicly sold, an invoice and account of sale are to be sent to the bureau, and the money resulting from such sale to be deposited, without delay, with the nearest government depositary, proper receipts being taken.

Recruiting.—An important duty of medical officers is connected with recruiting, and they are held strictly accountable to the bureau for improper enlistments.

Medical officers are required to make *certificates of physical examinations* of enlisted men, and to keep a *record of physical condition* of all minors, including cadets and apprentices,—examinations of whom are to be made at intervals of twelve months. The record of the cadets is to be retained at the Naval Academy. In case of apprentices and enlisted minors it will constitute their descriptive list, and accompany them throughout their career in the service.

An accurate list of persons examined for enlistment or appointment is to be kept wherever such enlistments are made, in every case to be signed by the medical officer making the examination.

A *descriptive list* of all men transferred or discharged is to be signed by the executive-officer and the senior medical officer.

When defects are waived by the Navy Department, in cases of enlisted men, the medical officer is fully to describe the same, and report the case to the Bureau of Medicine and Surgery, as a bar to claims for pension.

Medical officers are to vaccinate all recruits, and to make regular reports of the results.

In *sea-going ships*, as soon as possible after reporting for duty, the senior medical officer is to inspect the dispensary and store-rooms, examine the outfit, prepare medicines and instruments for use, and report his department ready for inspection. Having secured everything for sea, he opens his medical journal upon the day when the officers and crew are received on board. He examines the crew, by divisions, and reports those whom he considers disqualified for service, and calls for a medical survey if necessary. He causes all who may require it to be vaccinated, and instructs such persons as the commanding officer shall designate in the use of the tourniquet. He will always be prepared for battle, and, after an engagement, will report casualties to the commanding officer and to the surgeon of the fleet, with complete details of each case.

On board ship, all wines, spirituous liquors, mineral acids, and inflammable fluids in the medical department must be locked up by themselves, to be disposed of, in case of fire, as the exigency demands.

Naval Hospitals.—The medical officer in charge of a naval hospital is to enforce strict obedience to the laws and regulations of the Navy Department, in accordance with the established usages and discipline of the service. The hospital, its grounds and appurtenances, and all persons and property attached to it, are to be under his control. He is responsible for the proper treatment of the sick and wounded, and for the good order, cleanliness, discipline, and economy of the entire establishment, and is to preserve everything in good condition. No punishment is to be inflicted without his orders. The medical officer second in rank is to reside in the hospital, and to have general charge in medical duty, but is to consult the officer in charge in all important matters. He is to assign duty to the junior medical officers, and to report to the officer in charge any neglect of duty or breach of discipline.

He is to see that the hospital records are carefully and neatly kept, and signed by the proper officers with name and rank. He, or an assistant, by his order, is to make a careful inspection, daily, of the wards, dining-rooms, kitchens, laundry, and cellars, and report their condition to the medical officer in charge. He is also to inspect all provisions, medicines, groceries, and bed and table furniture that may be received, and report any deficiency to the officer in charge.

Junior medical officers serving in hospitals, in addition to their duties in the wards, shall be detailed, in turn, as officer of the day, and are not to leave the building during their tour of duty. The officer of the day is to inspect the food at meal-times, and to attend to the admission and discharge of patients, and to see that proper papers are sent and received.

The medical officer in charge of a hospital ward is responsible for order, neatness, and good conduct therein, as well as for everything regarding the welfare of the sick and wounded.

The medical officer in charge of a hospital is to make no changes in the hospital buildings or grounds without permission of the Bureau of Medicine and Surgery. He is carefully to scrutinize the monthly pay-roll of persons employed under the bureau before signing it.

The products of the ground attached to a naval hospital are to be expended for the benefit of the hospital, at the discretion of the surgeon in charge.

The official papers pertaining to the conduct of naval hospitals are principally as follows, viz.: hospital tickets, alphabetical register, quarterly list, abstract of patients, journal of subsistence, case papers, ration notices, certificate book, certificates of ordinary disability and certificates of death, reports of surveys, declarations for pension, vouchers for expenditure, hospital ration return, receipt and expenditure book, requisitions, weekly report of sick, weekly report of beds, and monthly pay-roll.

Surveys, upon persons and upon medical property.—Personal surveys, next to the preservation of life and limb, are the most important duties of medical officers. The Commissioner of Pensions founds his decisions upon them. In

case of surveys, and all matters connected with the evidence in pension claims, medical officers are forbidden to give information to agents or others. All such persons must be referred to the Commissioner of Pensions.—*E. Shippen.*

Medicine-chest. A chest containing a supply of medicines for the use of the crew of a merchantman. Every vessel of 150 tons or more, navigated by 10 or more persons in all, and bound on a voyage beyond the United States, and every vessel of 75 tons or more, navigated by 6 or more persons in all, is required to have a chest of medicines, put up by an apothecary of known reputation, and accompanied by directions for administering the medicines. The chest must be examined at least once a year, and supplied with fresh medicines. In case of dispute the owner must prove the sufficiency of the medicine-chest; it does not lie with the seaman to prove its insufficiency. If a seaman requires further medicines and medical advice than the chest and directions can give, it would seem that the ship ought to bear the expense. If the medicine-chest can furnish all the needs, the ship is exempted.

Medico. A familiar appellation for the ship's surgeon.

Mediterranean Pass (*Eng.*). A document formerly granted by the lords of the Admiralty to registered vessels, which was valuable when the Barbary powers were unchecked.

Meermaid. A name given by the English fishermen to the *Lophius piscatorius*, or frog-fish, without reference to the mermaid.

Meer-swine. The porpoise (from the German *meerschwein*).

Meet Her! The order to adjust the helm so as to check any further lateral movement of the ship's head.

Melanurus. A small fish of the Mediterranean; a species of *Sparus*, or gilt-head.

Melbourne is situated on the Yarra Yarra, 8 miles from its mouth, in Southeastern Australia, colony of Victoria, of which it is the capital. Lat. 37° 43′ 53″ S.; lon. 144° 47′ 42″ E. The river has a bar at its mouth, and a second half-way to the town, which compels the largest shipping to anchor at Hobson's Bay, near the mouth of the harbor, to which there is now a railway direct from Melbourne, with two piers projecting into deep water. The commerce of Melbourne is very extensive, and represents about nine-tenths of the entire trade of the colony. Melbourne is the first and last port of call for the mail-ships to Galle. Pop. 62,000; including adjacent boroughs, 247,000.

Memel. A seaport town of Prussia, at the north end of the Curische-Haff, where the Dange falls into the Baltic. Lat. 55° 43′ 42″ N.; lon. 21° 6′ 12″ E. It is the seat of an admiralty court, and contains an exchange, marine hospital, school of navigation, and other fine buildings. It is the entrepôt of the foreign trade of Western Russia. It has extensive manufactures, but the great source of its prosperity is its trade, which consists chiefly of timber, corn, flax, hemp, etc. The harbor is large and safe, and has a depth of water of from 14 to 17 feet. Ship-building is carried on to a considerable extent. Pop. 20,000.

Memphis, Shelby County, Tenn., is the principal city in the State, and is the most important and populous town on the Mississippi River between St. Louis and New Orleans. It is beautifully situated on a bluff, elevated about 60 feet above high-water mark, the base of which is washed by the river for a distance of three miles, while a bed of sandstone projects into the stream and forms a convenient landing. It occupies the only eligible site for a commercial depot from the mouth of the Ohio to Vicksburg. As a market for cotton it is surpassed by only two or three cities in the United States; the quantity received in a year is about 400,000 bales, valued at $33,000,000. Pop. 62,500.

Mend. *To mend sail*, or *mend the furl*, to skin the sails up afresh when they have been badly furled.

Menendez de Aviles, Pedros, a distinguished Spanish officer of an ancient Asturian family. Born in 1519; died about September 15, 1574. Wild in his youth, he gained distinction in cruises against the corsairs and the French; acquired wealth in the New World; was captain-general of the fleet sent with troops to Flanders, contributing, it is said, to the victory of St. Quentin. Afterwards went to the West Indies as general of the fleet and army; amassed vast riches, and, in 1561, on his return to Spain, was arrested by the Council of the Indies, imprisoned, and heavily fined for his conduct there. At the head of an expedition for the conquest and colonization of Florida, he sailed from Cadiz, June 29, 1565. September 7 he discovered the bay and river, which he named St. Augustine, and landing, took formal possession on the 8th, and laid the foundation of St. Augustine, the oldest town in the United States. September 21, at daybreak, he surprised and put to the sword the French Huguenot garrison at Fort Caroline,—a piece of cruelty afterwards avenged by De Gourgues upon the Spanish garrison there. He returned to Florida two years later, rebuilt San Mateo, and in 1574, after his return to Spain, was given the command of the Armada of 300 sail at Santander, destined against England, when he died suddenly, at the age of 55.

Menkalinan. The star β *Aurigæ.*

Menkar. The bright star α *Ceti.*

Menopome. One of the largest batrachians found in some of our rivers, and known by many names, such as *hell-bender*, *tweeg*, *mud-devil*, *ground-puppy*, etc.

Mensa. See CONSTELLATION.

Merak. The star β *Ursæ Majoris.*

Mercantile Marine. A collective designation of the persons and vessels engaged in transporting the commodities exchanged in commerce.

Mercator's Chart. A chart constructed on what is called Mercator's projection. All the meridians are parallel right lines, and the degrees of longitude are all equal; the parallels of latitude are at right angles to the meridians, and the degrees of latitude increase in length from the equator to the pole in the same proportion as the degrees of longitude decrease on the globe. It may be constructed with the aid of a table of meridional parts. The property which makes the Mercator's chart so useful for purposes of navigation is, that on it the track of a ship appears as a straight line. See CHART.

Merchantman. A vessel employed in conveying freight or passengers, as distinguished from a national vessel, and from vessels in the revenue service, coast survey, etc.

Merchant Service. The mercantile marine.

Mercurial Gauge. A pressure-gauge which depends for its action upon the effect of the fluid on a column of mercury; the pressure may act directly on the column or be transmitted by an intervening fluid, one or more pistons, or an elastic diaphragm of metal or other suitable material.

Mercury. The nearest planet to the sun. Mean distance, 37 millions of miles; diameter, 3000 miles; apparent diameter, 5″ to 12″. Symbol ☿, representing a wand. See VULCAN.

Merganser. A genus of birds of the family *Anatidæ.* They inhabit the coasts of northern regions, but migrate southwards in winter.

Meridian. A great circle passing through the poles of a sphere. A *terrestrial* meridian is an ellipse formed by the intersection of the earth's surface by a great circle passing through the poles. A *celestial* meridian is a great circle of the celestial sphere passing through the poles; it intersects the horizon in its north and south points. *Prime meridian,* the origin whence longitude is reckoned. A *meridian-line* is the line formed by the intersection of the meridian and the plane of the sensible horizon; a north-and-south line. *Meridian altitude,* the altitude of a heavenly body when it bears due north or due south. *Meridian zenith distance,* the complement of the meridian altitude. *Meridional difference of latitude,* the quantity bearing the same proportion to the difference of latitude that the difference of longitude bears to the departure. *Meridional parts.* At the equator a degree of longitude is equal to a degree of latitude, but, as we approach the poles, while (supposing the earth to be a perfect sphere) the degrees of latitude remain the same, the degrees of longitude become less and less. In the chart on Mercator's projection the degrees of longitude are made everywhere of the same length, and therefore, to preserve the proportion that exists at different parts of the earth's surface between the degrees of latitude and the degrees of longitude, the former must be increased from their natural lengths more and more as we recede from the equator. The lengths of small portions of the meridian thus increased, expressed in minutes of the equator, are called *meridional parts.* *Meridional projection,* a projection of a sphere in which the plane of projection coincides with or is parallel to the meridian.

Merkin. An old name for a sponge for cleaning cannon.

Merling. A small fish; *Merlangus vulgaris* (*Gadus merlangus* of Linnæus); the whiting.

Mermaid (German *meer,* sea, and *magd,* maid). A fabulous creature, the fore part woman, the hinder part fish. The species of actually existing animals that, viewed at a distance in the sea, may have originated the idea of mermen and mermaids are the cetaceous *dugong* and *manatee.* These have their fore fins rudely fashioned like arms and hands, and terminate behind in a fish-like tail. The nipples are pectoral, and they are often seen ascending to the surface to breathe, clasping their sucking young to the breast. The mermaid is a not unfrequent heraldic bearing. In the heraldry of France she is called a siren, and in Germany she is occasionally fitted with two fishy tails.

MERMAID'S GLOVE. The name of a peculiar sponge (*Spongia palmata*) abundant at Bermuda. It derives its name from a somewhat finger-like arrangement of its branches.

MERMAID'S PURSE. The oblong, horny cases with long filiform appendages developed from each of the four corners, found on the sea-shore, being the outer coverings of the eggs of several species of rays and sharks. Also, the hollow root of the seaweed *Fucus polyschides.*

Merman. See MERMAID.

Merry Dancers. The glancings and coruscations of the aurora borealis or northern lights.

Merry Men of May. Dangerous currents formed by the ebb-tides.

Mesh. The opening between the lines in a net.

Mess. A company of officers or men of a ship who take their meals together. The commanding officer messes alone; if there be more than one cabin-officer on board, they may form one mess if they desire. The wardroom mess is composed of the staff-officers above the grade of ensign, and of line-officers from lieutenant-commander to master, inclusive. If an ensign has charge of a watch and a division he messes in the wardroom. If a staff-officer having the relative rank of ensign is the head of a department he messes in the wardroom. The steerage mess is composed of ensigns, midshipmen, and clerks. The warrant-officers' mess is composed of the boatswain, gunner, carpenter, and sailmaker. Passengers mess with the officers of corresponding rank. The caterer of a mess has charge of its general conduct and order, but the executive-officer has the power to interfere to prevent disorder.

The master-at-arms, orderly sergeant, all yeomen, apothecary, machinists, coppersmiths, and boiler-makers mess together on the berth-deck. Petty officers may be messed by themselves. The crew is divided into messes of convenient size, and a certain part of the deck assigned them; they are allowed to commute as many rations as may be authorized by the commanding officer, and the money is expended for fresh provisions or may be divided up among them.

MESS-CLOTH. A tarpaulin spread on the deck, answering the purpose of a table-cloth.

MESS-GEAR. Pots, pans, spoons, knives, forks, etc.

MESSMATES. Members of the same mess.

MESS-TRAPS. Mess-gear (which see).

Messenger. An endless rope or chain going around the capstan and a roller at the manger. The messenger is securely bound to the cable by nippers, and as the capstan is hove around the cable is hauled in. As the nippers approach the capstan they are taken off and others put on near the hawse-hole. Messengers are out of date, and are not to be met with on board men-of-war, except in a few old sailing-vessels. The cable is now brought direct to the capstan. See CAPSTAN, NIPPERS. Also, a boy to carry messages from the quarter-deck.

Messina, Sicily, is situated on the Strait of Messina, in lat. 38° 11′ 10″ N., lon. 15° 34′ 45″ E.; is strongly fortified, being walled and defended by a citadel and forts. The harbor, one of the best in the Mediterranean, is of great depth and perfectly secure in all weather. Its manufactures of silk goods and satins have long been famous, and its commerce is very extensive.

The exports consist chiefly of silks, fruits, wine, spirits, sumac, etc. It has valuable tunny and other fisheries. Population, including suburbs, 112,000.

Meta-centre. The meta-centre of a floating body is the point where the vertical passing through the centre of buoyancy in the position of equilibrium meets the vertical drawn through the new centre of buoyancy, when the body has been slightly displaced from this position. It is a point in a ship above which the centre of gravity of weight must never be placed, because if it were the vessel would at once capsize.

Metal. The ordnance of a ship. *Heavy metal*, guns of great calibre.

Metallic Packing. Piston-packing of one or more metallic rings, usually iron or brass; also, a patent piston-packing composed of braided wire.

Metalline. A soft metallic compound for lining journal-boxes.

Meteor. See AEROLITES.

Meteorology. The science which treats of the air and its phenomena.

Metonic Cycle. A cycle of 19 years, which contains 235 lunations, and results in a correspondence of the solar and lunar years. The discovery of this astronomical period may be assigned to Meton in 432 B.C. See CYCLE.

Mètre (*Fr.*, from Gr. *metron*, a measure). The French standard measure of length, being the ten-millionth part of the quadrant of the meridian. The other measures of length are referred to this, the whole system being decimal; Latin prefixes are used to indicate division, Greek prefixes, multiplication. Thus, a *decimètre* (*decem*, ten) is the tenth of a mètre; a *centimètre* (*centum*, a hundred), the hundredth part of a mètre; a *millimètre* (*mille*, a thousand), the thousandth part of a mètre. Again, a *decamètre* (*δέκα*, *deka*, ten) is ten mètres; a *hectomètre* (*ἑκατόν*, *kekaton*, a hundred) is one hundred metres; a *kilomètre* (*χίλιοι*, *chilioi*, a thousand), one thousand mètres; a *myriamètre* (*μυριάς*, *murias*, ten thousand), ten thousand mètres. A mètre is equal to 39.37079 English inches; and from this all the other French measures may be obtained by shifting the decimal point.

Micrometer (Gr. *mikros*, little, and *metron*, a measure). An instrument used with the telescope or microscope for measuring minute distances, or the diameters of objects which subtend very small angles. Contrivances of various kinds, and depending on different principles, have been employed for this purpose. The micrometer is of the utmost importance in astronomy, and to it that science is as much indebted as to the telescope itself. Its most simple form, as applied to astronomical purposes, is that of a short tube, across the opening of which are stretched two parallel threads, which can be made to approach or recede from each other by means of screws. These two threads are crossed by a third perpendicularly, and the whole apparatus is placed in the focus of a lens. The distance of two stars is found by adjusting the two parallel threads, one to pass through the centre of each star, taking care that the threads are placed perpendicular to the line joining the stars, and finding how many turns and parts of a turn of the screw are required to bring the wires to coincide. The angle of position of two stars is also obtained by turning round the instrument till the third wire, which is normally horizontal, bisects both stars, and reading off on the circumference the arc passed over. Another form of micrometer is the circular, the principle of which may be described as follows: if the field of a telescope be perfectly circular, and if its diameter be determined from observation, the paths of two celestial bodies across the field may be considered as two parallel chords, which are given in terms of a circle of known diameter. The differences of the times at which two stars arrive at the middle of their paths will be their ascensional difference; and the distance between the chords, which is readily computed from their lengths, gives the difference of the declinations of the two bodies. The most approved construction of the annular micrometer is that of Fraunhofer, which consists of a steel ring surrounded by a flat rim of glass and mounted in a brass tube, so that it may be accurately adjusted in the focus of the eye-piece of the telescope. When so applied the steel ring is alone visible and appears as if suspended in the atmosphere, whence the instrument is called the *suspended annular micrometer*. The advantage of this construction consists in the accuracy with which the moment of ingress or egress is determined from the body being seen in the field of view before it comes up to the edge of the steel ring. The annular micrometer is conveniently used for comparing the place of a small star or a comet with that of a known star in nearly the same parallel of declination. The Abbé Rochon, in the beginning of the present century, conceived the ingenious idea of applying the principle of double refraction to micrometrical measurement. He constructed an instrument composed of two prisms of rock-crystal or Iceland spar. These prisms were fixed together with their axes of crystallization at right angles to each other, to increase the deviation of the two images; and the micrometer thus constructed was placed *within* the focus of the object-glass of a telescope, thus giving two images to be observed by the eye-piece. The distances between these images depend on the relative positions of the eye, the micrometer, and the object; and consequently, after the instrument has been graduated, all that is required to determine the apparent diameter of a heavenly body is to move the crystal backwards or forwards till the two images appear to touch, and the graduation corresponding to the place of the crystal gives the required result. This form of micrometer has been improved by Arago, Dollond, and others. Besides the instruments here mentioned many other micrometers exist.

Microscopium. See CONSTELLATION.

Mid. Abbreviation for *midshipman*.

Mid-channel. The middle part of a channel.

Middle Latitude. With reference to two places situated in the same hemisphere, the middle latitude is the latitude of the parallel passing midway between them; its value is therefore half the sum of the latitudes of the two places.

MIDDLE-LATITUDE SAILING. An approximate method of solving certain cases of spherical sailing, founded on the consideration that the arc of the parallel of middle latitude of two places intercepted between their meridians is nearly equal to the departure.

Middle Timber. That timber in the stern which is placed amidships.

Middle Watch. The period from midnight to 4 A.M. The men on watch during that time.

MIDDLE-WATCHER. A light meal taken by the officer of the middle watch.

Middleton, Edward, Rear-Admiral U.S.N. Born in South Carolina. Appointed from South Carolina, July 1, 1828; frigate "Java," Mediterranean Squadron, October, 1828, to May, 1831; sloop "Vandalia," West India Squadron, 1831–33; receiving-ship, Brooklyn, 1833–34.

Promoted to passed midshipman, June 14, 1834; frigate "Constitution," Mediterranean Squadron, 1835–38; sloop "Marion," Brazil Squadron, 1839–42.

Commissioned as lieutenant, March 2, 1841; store-ship "Lexington," 1843–44; sloop "Plymouth," Mediterranean Squadron, 1844–45; frigate "Cumberland," Home Squadron, 1846; steamer "Princeton," 1847–49; store-ship "Erie," 1849; navy-yard, Philadelphia, 1849–51; razee "Independence," Mediterranean Squadron, 1852; receiving-ship, New York, 1853; executive-officer of sloop "Decatur," Pacific Squadron, 1854–56; operating against a combination of hostile Indians of the various tribes of Washington and Oregon Territories during the war of the winter of 1854–55; attacks upon Seattle, Washington Territory, January 26, 1856.

Commissioned as commander, April 16, 1856; commanding sloop "Decatur," 1856–57; commanding steam-sloops "St. Mary's" and "Saranac" at different times, Pacific Squadron, 1861–65.

Commissioned as captain, April 24, 1863; special duty, New York, 1866; navy-yard, Mare Island, Cal., 1867–68; commanding steam-sloop "Pensacola," Pacific Squadron, August 27, 1868, to January 7, 1869.

Commissioned as commodore, November 26, 1868; commanding steam-sloop "Lackawanna," Pacific Fleet, February 6, 1869; commandant navy-yard, Pensacola, Fla., June 1, 1870, to March 8, 1873.

Commissioned as rear-admiral, August 15, 1876. Retired, December 11, 1872.

Middy. An abbreviation for *midshipman.*

Mid-feather. A water-bridge in the rear of the furnace of a steam-boiler, in a mid-position in the flue-space to enable the flame to pass above and below it; object, to increase circulation.

Midshipman. This term originated from the place assigned to the "young gentlemen," as they used to be called, amidships, or abreast of the mainmast.

In the larger class of vessels which, in the old build, had immensely high forecastles, quarter-decks, and round-houses, there were no means of going from the quarter-deck to the forecastle without descending into the waist; hence messengers were necessary in order to prevent the captain, or the officer of the watch, from having thus, in a measure, to desert his station, and these messengers took the orders from the officer at the break of the quarter-deck, and carried them to the forecastle, and likewise brought the various reports from the officers stationed forward to those in command abaft, and thence from their station were called *midshipmen.* It was from this class and that of quartermaster in the British navy that the master's mates were generally taken, as the contact into which they were naturally thrown with their superior officers led to this distinction when their conduct was meritorious; the promotions from the class of midshipman were much more numerous than those from the class of quartermaster, the former being necessarily selected from active, smart young men, while the latter were taken from the thoroughbred old tars. This patronage invested in the captains of ships of war gradually led to the sons of persons of respectability being appointed to these stations, whence with a slight degree of interest they were advanced to superior rank. Later, a set of youngsters was introduced into the British service by what is called a "king's letter." These were called "king's letter boys," and were but little relished by the rougher class of their associates for having, as they termed it, "Come in at the cabin windows instead of at the hawse-holes."

The midshipmen at first messed with the ship's company, having one or more tables given them on the lower deck, according to their number. They afterwards, in some vessels, had the heart of one of the cable tiers—quite a roomy place when hemp-cables were in vogue—given them as a mess-place, the quartermasters and boatswains' mates having the other. Those midshipmen or master's mates in whom the captain or officers took an interest were occasionally invited to their table, and in process of time the custom became general. See ACADEMIES, NAVAL.

MIDSHIPMAN, PASSED, is a midshipman who had passed an examination entitling him to promotion to a lieutenant whenever there occurred a vacancy in that grade. Since the title of ensign has been adopted, graduates of the U. S. Naval Academy waiting promotion to the grade of ensign are styled midshipmen, while undergraduates are called cadet-midshipmen.

In October, 1819, a board of senior captains, of whom Commodore Wm. Bainbridge was the president, was ordered by the Secretary of the Navy to convene at New York to examine midshipmen for promotion. This was the first examination instituted in our navy. It has continued ever since, and was the origin of the title "passed midshipman."

MIDSHIPMAN'S NUTS. Broken pieces of biscuit as dessert.

MIDSHIPMAN'S ROLL. A slovenly method of rolling up a hammock transversely, and lashing it endways by one clew.

Midships. The middle part of the vessel, either with regard to her length or breadth.

MIDSHIP BEND, or MIDSHIP FRAME. The frame of the ship which is the most capacious.

Mile (Lat. *mille passus*, a thousand paces). The common mile is the *statute* mile so called, from being incidentally defined in a statute of Queen Elizabeth. The *geographical*, *nautical*, or *sea*-mile is the mean length of a minute of latitude, and hence is sometimes called a *minute.* The length of the statute mile is 5280 feet; that of the nautical mile, 6082.66 feet; therefore one nautical mile = 1.1515 statute miles, and one statute mile = .8684 nautical mile. The kilomètre is sometimes called a *metrical* mile, and its length is equal to 1093 yards.

Military Law may be defined as a rule of conduct for military persons prescribed by the legislative power in a state, commanding what is to be done, and prohibiting the contrary.

In the United States, military law is principally expressed in Articles of War enacted by Congress pursuant to authority vested in it by the Constitution (Art. I. Sec. 8) "to make rules for the government and regulation of the land and naval forces." To this principal code is, however, to be added a body of regulations formulated by the Executive and ratified by Congress. These two, the Articles of War and the Army Regulations, taken together, constitute the written military law of the United States. What is known as the "custom of war" forms the unwritten part of the law military, and its aid is sought to explain doubtful questions arising in the course of procedure in military tribunals. The custom appealed to must be that of our own service, must be certain and well defined, and must not contravene any portion of the written military code.

Naval law has the same source and authority as military law, is constructed on the same principles, and is similarly administered, the points of divergence being mainly such as necessarily result from the differing spheres of action of the land and naval forces. See COURTS-MARTIAL, JUDGE-ADVOCATE, JUDGE-ADVOCATE-GENERAL, MARTIAL LAW, MUTINY ACT, OATHS.

Milky-way. See GALAXY.

Miller. *To drown the miller*, to put an extra quantity of water into grog. A fish of the genus *Myliobatis.*

Miller's Thumb. A fresh-water fish, the *Cottus cataphractus.*

Milt. The soft roe, or spermatic part, of the male fish.

Milwaukee, the most populous town of Wisconsin, is situated on the west shore of Lake Michigan, at the mouth of Milwaukee River, in lat. 43° 3′ 45″ N., lon. 87° 57′ W. The Menomonee River joins the Milwaukee about half a mile from its mouth, and the largest boats of the lakes can ascend the Milwaukee 2 miles from its mouth, as also the Menomonee for some distance from its confluence with the Milwaukee. The city has now one of the best harbors upon the whole chain of lakes. This city is the outlet and shipping port of a rich and rapidly improving country, and is said to be the greatest primary wheat-market in the world. Steamers run across the lake during the whole year. Six railroads centre here, the Chicago, Milwaukee and St. Paul, Chicago and Northwestern, Detroit and Milwaukee, Milwaukee, Lake Shore and Western, Western Union, and Wisconsin Central. Pop. 130,000.

Mine, Submarine. A defensive torpedo. See TORPEDO.

Minion. An old 4-pounder gun about 7 feet long. Its point-blank range was 120 paces, with a random one of 1500. Bourne, in 1578, mentions the minion as requiring shot 3 inches in diameter.

Minister. In affairs of state the designation of two classes of functionaries. The first of these embraces those officials who preside over the administrative departments of public business, and who in most countries form what is generally known as the "cabinet" of the executive head of the government. In the United States these officers are officially known as "secretaries."

The other class of public servants known as ministers are diplomatic agents accredited to the sovereigns or chief executives of foreign states. In the diplomatic service of the United States two grades of ministers exist, the higher being designated *ministers plenipotentiary*, and the lower *ministers resident.*

Minnow. A small fresh-water fish,—the *Leuciscus phoxinus.*

Minor Planets. See PLANETS, MINOR.

Minute. The sixtieth part of an hour. The sixtieth part of a degree. A nautical mile is sometimes called a *minute*, as being the mean length of a minute of latitude.

MINUTE-GUNS. Guns fired at an interval of a minute, as a mark of respect, on the death of a high official.

Mira. A remarkable variable star, *o Ceti.*

Mirach. A name given each of the stars β *Andromedæ* and ϵ *Boötis.*

Mirage. An optical illusion very common at sea, especially in high latitudes, and sometimes also witnessed on land, particularly in Lower Egypt, Persia, Tartary, the western plains of the United States, and on the margin of rivers or lakes, or on the sea-shore. It arises from unequal refraction in the lower strata of the atmosphere, and causes remote objects to be seen double, as if reflected in a mirror, or to appear as if suspended in the air. When the effect is confined to apparent elevation, the English sailors call it *looming;* when inverted images are formed, the Italians give it the name of *Fata Morgana.* Ships in the whale-fisheries are often descried and sometimes recognized by means of the mirage at considerable distances. Capt. Scoresby, while cruising off the coast of Greenland in 1822, recognized his father's ship at the distance of more than 30 miles, and consequently when below the horizon, by its inverted image in the air, though he did not previously know that it was cruising in that part of the fishery. A very remarkable case of mirage occurred at Hastings, England, on the 26th of July, 1796, when the French coast, 50 miles distant and extending from Calais to near Dieppe, was distinctly visible for the space of three hours.

Mirfak. The star α *Persei.*

Mirkles. The radical leaves of the *Fucus esculentus.*

Mirzam. The star β *Canis Majoris.*

Misrepresentation. Misrepresentation to the underwriters of any fact or circumstance material to the risk of insuring, whether fraudulent or not, and whether by the insured or his agent, renders the contract null and void.

Miss Stays. To fail to get around in tacking ship, whether from the bad working qualities of the vessel, the lightness of the wind, or the carelessness or inexperience of the officer in charge of the deck.

Mist. Visible vapor suspended in the air near the surface of the earth; a light fog.

Mistico. Equivalent to *hermaphrodite*, being a small Mediterranean vessel, between a xebec and a felucca.

Mistral. A cold northwest wind experienced on the Mediterranean shores of France.

Mitre. The joining of two pieces together so that when connected the joint shall make an angle with the side of each piece that shall be common to both.

Mizar. A name given to each of the stars β *Andromedæ*, ϵ *Boötis*, and ς *Ursæ Majoris.*

Mizzen. A term which distinguishes the

mast next abaft the mainmast, and the yards, sails, and rigging belonging thereto. The name is sometimes given to the spanker. The lower yard across the mizzen-mast is called the *cross-jack* yard.

MIZZEN MAST-MAN. A man stationed to attend to the gear of the mizzen-mast. See MAST-MAN.

MIZZEN-ROYAL. See ROYAL.

MIZZEN STAY-SAIL. A sail which hoists on the mizzen-stay.

MIZZEN-TOP. See TOP.

MIZZEN-TOPGALLANT. See TOPGALLANT.

MIZZEN-TOPMAST. See TOPMAST.

MIZZEN-TOPSAIL. See TOPSAIL.

Mobile, Ala. (port of entry), is situated on the west bank of the Mobile River, at its entrance into the bay of the same name, in lat 30° 41′ 48″ N., lon. 87° 59′ W. It is the most important city in the State, and ranks third as a cotton-market in the United States. It has an advantageous position for trade, being the natural outlet of the greatest cotton region in the United States. The harbor has been improved by the government, and it will now admit vessels drawing 13 feet of water to the wharves. The total value of foreign exports in the year 1877 was $12,812,-066, and that of foreign imports $648,404. Pop. 42,000.

Mocha. The most strongly fortified seaport, and once the capital, of the province of Yemen, in Arabia. It is situated on the Red Sea, at the head of a little bay, near the Strait of Bab-el-Mandeb, 130 miles W.N.W. of Aden.

Model. A model of a ship is the exact shape of the ship intended to be built, and is made to a scale. It is sometimes made solid or in one piece, but generally in horizontal pieces, for the convenience of taking off the lines from all the parts.

Moderate Breeze. A breeze blowing from 8 to 12 miles per hour; it is denoted by 4 on the Beaufort scale.

Moidore. A former gold coin of Portugal, equal to 4800 reis; called also *Lisbonine.*

Moist Daughters. Spenser's term for the Hyades, a group of seven stars in the head of the Bull. See HYADES.

Moke. The mesh of a fishing-net.

Mold. The matrix in which an object is cast. A pattern by which an object is shaped. In founding, molds are made in green sand, dry sand, or loam.

MOLDED. The size of a timber the way the mold is applied. The opposite of *sided.*

MOLDED BREADTH. The greatest breadth of a ship to the outside of the frame-timbers.

MOLDER'S CLAMP. A frame which holds together the parts of a flask.

MOLD-FACING. A fine powder sprinkled over the pattern before it is covered with loam.

MOLDING. The marking out of the ship's timbers by the use of the molds made in the mold-loft, by placing the molds and bevels upon each separate piece, and lining it into the shape of the mold.

MOLDING-BOARD. The board on which the pattern lies when ramming the loam.

MOLDING-EDGE. The edge which is traced by the molds from which the bevels are applied in order to obtain the required shape of the timber.

MOLDING-LOAM. A mixture of sand and clay used in molding.

Mole. A massive work of solid masonry extending into the sea to defend a port from the violence of the waves; also, sometimes, the harbor itself.

Mole-bat. A clumsy fish of the genus *Orthagoriscus;* the short sun-fish.

Mollusks (Lat. *mollis*, soft). The name applied by Cuvier to the great primary division of the animal kingdom, which includes all those species having a gangliated nervous system, with the ganglions or medullary masses dispersed more or less irregularly in different parts of the body, which is soft and inarticulate. The pulmonary or branchial circulation is separate and distinct, but is aided by the direct propulsion of a heart in one class only. There is always a heart for the systematic circulation, and it mostly consists of one ventricle and one auricle. Some of the mollusks breathe air, but the greater part respire through the medium of salt or fresh water. The blood of the mollusks is white or bluish. In one class only is there a rudiment of an internal skeleton giving attachment to a part of the muscular system; in the rest it is absent, and the muscles are attached to various points of the skin. Their contractions produce inflections and extensions of their different parts, and, alternating with relaxations, enable the species to creep, climb, swim, burrow, and seize upon various objects, according as the form of these parts may permit; but as the locomotive organs are not supported by articulated and solid levers, the mollusks cannot leap or advance rapidly on dry land. Many of the aquatic species are encumbered with a heavy shell. Nearly all the mollusks have an extensive fold of the skin reflected over their body, which it covers like a mantle; it is sometimes produced into a breathing pipe, or extended and divided in the form of fins. When the mantle is simply membranous or fleshy, or when a horny or testaceous rudiment of a shell is developed, but remains concealed in the substance of the mantle, the mollusk is said to be *naked.* When the shell is so much enlarged that the contracted animal finds shelter beneath or within it, the species is said to be *testaceous.* In many of the mollusks the shell is composed of a single piece, which is usually a spiral tube, closed at one end and gradually increasing in size towards the open extremity, from which the animal is able to protrude itself. Shells of this description are called *univalves.* In others the shell is composed of two pieces or valves, attached to each other at one point by a hinge, which is furnished with an elastic ligament that serves to open the valves when it is not opposed by the action of the *abductor* muscles, whose office it is to keep the shell closed. Shells of this kind are termed *bivalves.* These differences in the character of the shells correspond with differences in the conformation of the animals inhabiting them. The bivalve mollusks exhibit no traces of a head, and hence are termed *Acephalous* mollusks; while the univalves have a distinct head, provided with organs of the special senses, and hence, by way of distinction, some writers have termed them *Cephalophora* (head-bearing).

Molly-mawk. A small kind of albatross which follows in the wake of a ship rounding the Cape.

Moneres. Galleys with but one rank of oars.

Money.

United States of America.

10 mills = 1 cent.
10 cents = 1 dime.
10 dimes = 1 dollar.
10 dollars = 1 eagle.

Argentine Confederation.

100 centesimos = 1 dollar or patacon = $1.00.
17 patacons = 1 doubloon.

Austria.

100 kreutzers = 1 florin = $0.47.

Belgium. See France.

Brazil.

Mil reis = $0.50. See Portugal.

British India.

12 pies = 1 anna.
16 annas = 1 rupee = $0.48.
15 rupees = 1 mohur.
Lac of rupees = 100,000 = £10,000.
Crore of rupees = 10,000,000 = £1,000,000.

Burmah.

4 great rweh (rees) = 1 bais = $0.03.
4 bais = 1 math.
4 maths = 1 tical or kyat.

Canada.

Accounts are kept in dollars and cents, and also in pounds, shillings, and pence. See United States, Great Britain.

Cape of Good Hope. See Great Britain.

Chili.

100 centavos = 1 dollar = $0.90.

China.

10 cash = 1 candareen (fun).
10 candareens = 1 mace (tsien).
10 mace = 1 tael (lëang).
Among foreigners 1000 cash (about) = 1 dollar = $1 00.

The only native coin in use in China is the *tsien*, called *cash* by the English, and *sapeque* by the French, who derive it from the Portuguese *sapeca*. It bears on one side the name of the province in which it is cast, in Manchu letters, and also the Chinese word "money"; and on the other side the name of the reigning emperor, and above and below the words "current money," in Chinese characters.

Spanish, Mexican, South American, and United States trade dollars, though not acknowledged by the government, are employed as a commercial medium throughout the maritime provinces and at the interior treaty ports. Lumps of stamped silver, called *sycee*, pass current at a fixed standard of purity.

The nominal moneys of account are the *lëang*, *tsien*, *fan*, and *li*, called by foreigners *tael*, *mace*, *candareen*, and *cash*, the proportion of which, one to the other, is decimal; but, from various causes, there is great diversity in the number of cash given in exchange for the *tael*. The terms *tael*, *mace*, *candareen*, and *cash* are merely denominations of weight.

The circulating medium, in transaction with foreigners at the open ports, is chiefly in whole or broken dollars, "clean" or "chopped"; and the value of the dollar in relation to the tael is variable, the latter being approximately one-third more.

Denmark.

96 skillings = 1 daler or rixdaler = $0.53.

Egypt. See Turkey.

France.

100 centimes = 1 franc = $0.193.
20 francs = 1 napoleon or louis.

Germany.

10 pfennings = 1 groschen.
10 groschen = 1 mark = $0.235.

Gibraltar.

16 quartos = 1 real.
12 reals = 1 dollar = $1.00.
100 cents = 1 dollar.
10 decimas de real vellon = 1 real de vellon.
20 reals de vellon = 1 dollar = $1.00.
100 reals de vellon = 1 doblon.

Great Britain.

12 pence = 1 shilling.
20 shillings = 1 pound = $4.8665.

Greece.

100 lepta = 1 dracham = $0.193.

Holland.

100 cents = 1 guilder or florin = $0.40.

Italy.

100 centimes = 1 lira = $0.193.

Japan.

10 rin = 1 sen.
100 sen = 1 yen = $1.00.

Mexico.

100 cents = 1 dollar = $1.00.

Norway.

24 skillingen = 1 mark or ort.
5 marks = 1 species-daler = $1.07.

Portugal.

400 reis = 1 cruzado.
480 reis = 1 cruzado novo or pinto.
1000 reis = $1.08.
4500 reis = £1.

Russia.

100 copecks = 1 silver rouble = $0.75.
10 roubles = 1 imperial.
The paper rouble = $0.60 (about).

Siam.

200 to 450 cowries or bier = 1 p'hainung.
4 p'hainungs = 1 fuang.
2 fuangs = 1 salung or miam.
4 salungs = 1 tical.
4 ticals = 1 tamlung = $2.40.

Spain.

100 centimos = 1 peseta = $0.19.

Sweden.

100 öre = 1 riksdaler = $0.27.

Turkey.

40 paras = 1 piastre.
100 piastres = 1 medjidie or lira turca = $4.32.

Money-bound. A phrase expressive of such passengers as are detained on board till a remittance arrives for paying the passage made.

Monger. A fishing-vessel of small size.

Monitor. A vessel of war designed by Ericsson. See Ironclads.

Monk, George, Duke of Albemarle. Born in Devonshire, England, December 6, 1608. After spending the earlier years of his life in the service of Holland, he entered the English army at the age of 30, attaining the rank of lieutenant-colonel in the war against the Scots in 1639. During the Irish rebellion (1642) he was colonel of Lord Leicester's troops sent to crush it. When the civil war began he was supposed to favor Parliament, and was imprisoned, but soon after released. In 1644 he was defeated and captured by Fairfax. After two years' imprisonment in the Tower, he was liberated on his swearing to

the Covenant. He was then given the command in the north of Ireland. Cromwell having a high opinion of his military ability, made him his lieutenant-general and chief of artillery; and for extraordinary services rendered at the battle of Dunbar he was promoted to commander-in-chief of the army in Scotland. It required in those days but a small amount of professional training to convert a general into an admiral, so in 1653 we find Monk in command of a division of the fleet of Admiral Blake, consisting of 100 ships, with which he defeated Admiral Van Tromp off Nieuwpoort. He also fought with him again off Katwijk, in which battle Van Tromp was killed. In 1654 he was made governor of Scotland, his principal residence being at Dalkeith, where he lived until the death of Cromwell, when seeing everything in confusion, and regarding his own position as perilous, he crossed into England with 6000 men in January, 1660, and uniting his troops with those which Fairfax had collected for Charles II., he entered London unopposed, although as yet he had kept his views profoundly secret. On the 21st of February he called together the remaining members of the Parliament, and Charles II. being presently recalled, Monk was made Duke of Albemarle, and intrusted with the highest offices in the state. In 1666 we again find him at sea, as second in command of the fleet sent against the Dutch. He was defeated by De Ruyter in a sea-fight off Dunkirk, but soon after gained a bloody victory over him off North Foreland. He died January 3, 1670.

Monk-bag. A small bag strung around the neck, in which sailors keep their money. See BAG.

Monkey. A heavy weight which acts by the force of gravity, as in driving piles, etc.

Monkey-boat. A half-decked boat above-bridge on the Thames. A small boat used about docks.

Monkey-block. A small swivel-block used as a leader for running rigging.

Monkey-jacket. A short, close-fitting coat worn in cold weather.

Monkey-pump. Straws or quills for sucking the liquid from a cask, through a gimlet-hole made for the purpose,—a practice as old as the time of Xenophon, who describes this mode of drinking from the prize jars of Armenia.

Monkey-spars. Small masts and yards for a vessel devoted to the instruction and exercise of boys.

Monkey-tail. A lever for training a carronade.

Monkey-wrench. A wrench with an adjustable jaw, usually worked by a screw.

Monk-fish. The *Squatina angelus*.

Monk-seam. The seam made after sewing the edges of sails together, one over the other, by stitching through the centre of the seam. Also, the fash left at the junction of the molds when a ball is cast.

Monmouth Cap (*Eng.*). A flat worsted cap formerly worn by soldiers and sailors.

Monoceros. See CONSTELLATION.

Monoxylon (*Gr.*). Boats in the Ionian Isles propelled with one oar.

Monsoon (Malayan, *musim*) is derived from the Arabic word *mausim*, a set time or season of the year, and is applied to those winds prevailing in the Indian Ocean which blow from the southwest from April to October, and from the opposite direction, or northeast, from October to April. The existence of these winds was made known to the Greeks during the Indian expeditions of Alexander, and by this knowledge Hippalus was emboldened to sail across the open sea to Muzeris, the emporium of Malabar. The monsoons depend, in common with all winds, whether regular or irregular, on the inequality of heat at different places and the earth's rotation on its axis; but more particularly they are occasioned by the same circumstances which produce the trade-winds and the land- and sea-breezes, being, in fact, the combined effect of these two sets of causes.

If the equatorial regions of the earth were entirely covered with water, the trade-winds (see TRADE-WINDS) would blow constantly from the northeast in the north, and from the southeast in the south torrid zone, with a belt of variable winds and calms interposed; the whole system, following the sun's course, moving northward from December to June, and southward from June to December. But, especially in the eastern hemisphere, large tracts of land stretch into the tropics, and give rise to the extensive atmospheric disturbances for which those parts of the earth are so remarkable. During the summer half of the year, the north of Africa and the south of Asia are heated to a higher degree than the Indian Ocean, while Australia and South Africa are much colder. As the heated air of Southern Asia expands and rises, and the colder air from the south flows in to supply its place, a general movement of the atmosphere of the Indian Ocean sets in towards the north, thus giving a *southerly* direction to the wind; but as the air comes from those parts of the globe which revolve quicker to those which revolve more slowly, an easterly direction will be communicated to the wind; and the combination of these two directions results in the southwest monsoon, which prevails there in summer. Since, during winter, South Asia is colder than the Indian Ocean, which, again in its turn, is colder than South Africa, a general motion of the atmosphere sets in from the south and west. As this is in the same direction as the ordinary trade-wind, the effect in winter is not to change the direction, but only to increase the velocity of the trade-wind. Thus, while south of the equator, owing to the absence of sufficiently large tracts of land, the southeast trade-winds prevail throughout the year; on the north of the equator we find the southwest monsoon in summer and the northeast in winter, it being only in summer and north of the equator that great changes are effected in the direction of the trade-wind.

Similar, though less strongly marked monsoons prevail off the coasts of Upper Guinea in Africa and Mexico in America. The east and west direction of the shores of these countries, or the large heated surfaces to the north of the seas which wash their coasts, produce, precisely as in the case of South Asia, a southwest monsoon in summer. As might have been expected, the monsoon off the coast of Mozambique is easterly, and that off the coast of West Australia northwesterly. The trade-winds also suffer considerable change in their direction on the coasts of Brazil, Peru, Lower Guinea, etc. These, though

sometimes considered monsoons, are not truly such, for they do not change their directions periodically, so as to be opposite to each other, like true monsoons, but only veer through a few points of the compass.

In April, the northeast monsoon changes into the southwest, and in October the southwest into the northeast. These times depending on the course of the sun, and consequently varying with the latitude, are called the "breaking up" of the monsoons, and are generally accompanied by variable winds, by intervals of calm, and by furious tempests and hurricanes.

Monsoons, when compared with the trade-winds, will be found to play a most beneficial and important part in the economy of the globe. Their greater velocity, and the periodical changes which take place in their direction, secure increased facility of commercial intercourse between different countries. But the full benefits following in their train are not seen unless they be considered in their relation to the rain-fall of Southern Asia. Indeed, the fertility of the greater part of this fine region is entirely due to the monsoons, for if the northeast trade-wind had prevailed there throughout the year, Central and Western India, and many other places, would only have been scorched and barren saharas. The rain-fall of India depends entirely on the monsoons. The coast of Malabar has its rainy season during the southwest monsoon, which brings thither the vapors of the ocean. On the Coromandel coast, on the other hand, it is the northeast monsoon which brings the rain from the Bay of Bengal. The two coasts of Hindostan have therefore their seasons reversed, the dry season of one corresponding with the wet season of the other.

Monte Pagnote. In former days an eminence out of cannon-shot of operations, where spectators were not exposed to danger.

Montevideo, a seaport city and capital of the republic of Uruguay, is situated on a peninsula in the estuary of the La Plata, in lat. 34° 53′ S., lon. 56° 15′ W. Its port, open to the southwest, is the best on the Plata. The principal exports are hides, beef, hair, feathers, Chilian copper, and Paraguayan tea. Pop. 92,000.

Montgomery, John B., Rear-Admiral U.S.N. Born in New Jersey. Midshipman, June 4, 1812; lieutenant, April 1, 1818; commander, December 9, 1839; captain, January 6, 1853; commodore, July 16, 1862; rear-admiral (retired list), July 25, 1866; served on Lake Ontario, in attack on Kingston, Canada, November 10, 1812; capture of York, April 27, and of Fort George and Newark, May 27, 1813; in the "Niagara" in Perry's victory on Lake Erie, September 10, 1813 (receiving a sword and the thanks of Congress); in Decatur's squadron in the Mediterranean in 1815, and participated in the capture of Algerine frigate and brig, and blockade of Algiers; commanded sloop "Portsmouth," Pacific Squadron, 1845–48. During the cruise of the "Portsmouth" in the Pacific, he took possession of California, and blockaded Mazatlan some months. In October, 1847, he, with Capt. Lavalette, in the "Congress," captured Guayamas, on the Gulf of California; commanded Pacific Squadron, 1860–61.

Month. Originally, the period of the moon's revolution round the earth. If this is reckoned from the position of the moon among the stars to her return to the same position, the period is called a *sidereal* month, and consists of $27^d\ 7^h\ 43^m\ 11\frac{1}{2}^s$; but if from new moon to new moon, it is longer, being $29^d\ 12^h\ 44^m\ 3^s$; this is called a *synodic* month. There are several other periods used by astronomers to which this name is applied, as the *tropical* or *periodic* month ($27^d\ 7^h\ 43^m\ 4.7^s$), reckoned from the moon's passing the equinox till her return to the same point; the *nodal* month ($27^d\ 5^h\ 5^m\ 29^s$), from ascending node to ascending node; the *anomalistic* month ($27^d\ 13^h\ 18^m\ 37^s$), from perigee to perigee; and the *solar* month, which is the twelfth part of a solar year, consisting of $30^d\ 10^h\ 29^m\ 4^s$. Distinct from these is the *civil* or *calendar* month, fixed by law for ordinary purposes, and consisting of a fixed number of days,—from 28 to 31.

Monthly Allowance. A sum paid monthly to seamen, marines, and boys serving on board.

Montreal, the commercial metropolis of the Dominion of Canada, is situated on the island of Montreal, in the St. Lawrence River, in lat. 45° 31′ N., lon. 73° 34′ W. It is at the head of ocean navigation, and at the commencement of lake and river navigation. The harbor, which is formed towards the St. Lawrence, is secure, and improvements are being made every year to accommodate the large increase of shipping. Among the manufactories are foundries of iron, distilleries, breweries, sugar-refineries, manufactories of hardware, carriages, locomotives, steam-engines, etc. Pop. about 115,000.

Montrose. A seaport town of Scotland, in lat. 56° 42′ 30″ N., lon. 2° 28′ W. The harbor is one of the best on the east coast of Scotland. It is formed by the entrance of the South Esk into the North Sea, and has good docks and quays. The quays and wet-dock are about $1\frac{1}{4}$ miles from the entrance of the river. The chief imports are flax, hemp, coals, etc., the exports manufactured goods, grain, and cattle. Pop. 15,000.

Moon. The earth's satellite. Diameter about 2214 miles; mean apparent diameter 32′; distance from the earth 240,000 miles. The light of the full moon is equal to about 1-800,000 that of the sun; the heat is about equal to that of a candle 15 feet distant. The moon always shows the earth the same face, with little variation; hence it is known that she turns on her axis just once during each revolution about the earth. But on account of oscillations and vibrations, called librations, small portions of the opposite face are occasionally seen, so that an observer on the earth is enabled in the course of time to see four-sevenths of the surface. The absence of twilight, the absence of refraction when the light of a star passes near the moon, and researches with the polariscope indicate that the moon has no atmosphere. Without air, water can exist in the form of vapor only; but there is no evidence even of vapor of water. Without air and water no form of vegetable or animal life can exist. Even if these conditions were satisfied, the slow rotation of the moon, alternately shutting off the sun's rays, and exposing plants and animals to their fierceness for two weeks at a time, would require organizations materially different from those found on the earth. See Weather, Tide.

Moon-blink. A temporary evening blindness occasioned by sleeping in the moonshine in

tropical climates; it is technically designated *nyctalopia*.

MOON-CULMINATING STAR. A star which comes to the meridian about the same time with the moon. The difference of the right ascensions of the moon and star are observed at two places; the change in the difference is the moon's proper motion; as the moon's proper motion is known, the difference of longitude can be thus determined.

MOON-FISH. A fish whose tail-fin is shaped like a half-moon.

MOON-RAKERS. Sails above the sky-sails. They are usually called *moon-sails*.

MOON-SHEERED. A ship the upper works of which rise very high, forward and aft.

MOON-STRUCK. An influence imputed to the moon in the tropics, by which fish, particularly of the *Scomber* class, though recently taken, become intenerated, and even spoiled; while some attribute poisonous qualities to them in this state. Human beings are also said to be injured by sleeping in the moon's rays.

Moor. To secure a ship with cables attached to two anchors, to a wharf, or to permanent moorings. To moor *head and stern*, to moor ship with one cable leading from the hawse-hole and others leading aft from the stern; from this position the ship cannot swing. To moor with an *open hawse*, to lay out the anchors in a line at right angles to the prevailing wind. *To moor across*, to lay out the anchors on each side of a stream. *To moor along*, to anchor in a river with a hawser on shore to steady the ship. To make a *flying-moor*, see MOORING.

MOORING-BRIDLE. The fasts attached to permanent moorings, and taken through the hawse-holes when mooring.

MOORING-POST. A heavy vertical timber in the ground or on a wharf, to which vessels are made fast by means of chains or hawsers.

MOORINGS. Heavy chains permanently anchored in a harbor; to them are attached buoys with chains of sufficient length and strength to heave the fast up the hawse-hole.

MOORING-SWIVEL. A device used to connect two chain-cables in such a manner that the swinging of the ship will not bring turns in the hawse,—the object being to avoid the trouble of tending ship and clearing hawse. Frequently, one of the chains is unshackled in order to facilitate veering. With the mooring swivel on, if a gale comes on in a line with the anchors, the vessel is in the same condition as if at single anchor, except that in case another anchor is to be let go, it must be the sheet. If the gale comes on at right angles to the line of the anchors, the anchors and cables are in the worst possible situation, it being impossible to alter the angle between the cables from the swivel to the anchors. See MOORING.

Mooring (Dutch *marren*, to tie; to fasten). Securing a vessel in a particular position by means of cables attached to the shore, or to her own anchors at the bottom of the anchorage. *To moor ship*, or simply "to moor," is generally understood to mean the letting go of a second anchor in such a relative position to the first that the vessel may ride between the two. It may be readily understood that a vessel riding to a single anchor and a good scope of cable would take up too much room in any ordinary harbor. Tending, moreover, to each change of tide, the cable would soon become wound about the upper fluke of the anchor, rendering it liable to trip in the first puff of wind that struck the ship. If, then, the ship is to remain some time in port, it is customary *to moor*. This is effected as follows: after letting go the first anchor (see ANCHORING) cable is veered to double the ordinary scope, paying out the chain gradually as the vessel drops astern, so that it may lie on the bottom in a straight line from the anchor. Anchored in 6 fathoms water, veer to, say 90 fathoms chain, and let go the second anchor. The first cable is then brought to the capstan and hove in 45 fathoms, veering meanwhile on the second, so that when the operation is completed the ship may be midway between the two anchors and have 45 fathoms on each chain. She will now swing in a very small circle and keep both anchors clear.

In the foregoing it is supposed that the tide enables the ship to drop into the proper position for letting go the second anchor. Should this not be the case, a steamer would effect the object by resorting to her engines, a sailing-vessel to her sails; or a kedge and hawser may be run out in order to haul the ship over to the desired place; or the anchor may be carried out by the ship's launch, as must be done when it is to be planted in shoal water. After mooring put on the *mooring-swivel* (which see).

A flying-moor is made on first anchoring by combining the two manœuvres in one. Standing in for the anchorage, let go the first anchor with good headway on, running out double the mooring scope and then letting go the other anchor, after which proceed as before. This method is rarely desirable, particularly with sailing-vessels.

In a tide-way a ship is moored with her anchors up and down the stream. In roads where there is little or no tide, they are generally placed at right angles to the quarter whence the strongest winds are expected. To be moored under the latter conditions, however, is not always desirable. For let a ship be riding to her anchors placed on an east and west line and a gale to come on from the northward, then is the ship riding to a span, and does not derive the full benefit of her two anchors. Should the wind haul to the eastward, the lee-anchor, being astern, or to the westward, is of no use at all. Should the mooring-swivel part, the ship is entirely adrift with the loss of both bowers. Should it become necessary to let go a third anchor, the swivel still holding on, and the wind haul to another quarter, there would be danger of the three cables becoming hopelessly fouled. These, among other reasons, induce many good seamen to lie at single anchor where admissible, and veer to a long scope on the approach of bad weather. If obliged to let go the second anchor, a good scope is veered on each chain, the ship in that case getting the full benefit of both. This is not "mooring," however. There is a prejudice, too, against the *mooring-swivel*, many seamen preferring to take the occasional trouble of *tending ship* (see TENDING SHIP) and *clearing hawse* (which see) when necessary. A vessel may be moored "head and stern" by dropping one, or both, bowers under foot, and then veering astern the proper distance, letting go both sheets, bringing the

cables in through the stern chocks or ports. This done, heave in to the proper scope on the bowers. Or she may veer away on her bow cables till her stern is within the proper distance of the shore, mole, or pier, and then secure to the latter by fasts (hawsers or cables, either of hemp or chain) run out astern.

To moor to a buoy, or fixed or stationary moorings. The latter are large buoys well anchored in convenient positions, to which ships may secure instead of anchoring. To one of these a ship may moor by shackling her chain to the ring fitted for the purpose. A vessel may also *moor* alongside of a wharf or dock.

To unmoor is simply to pick up one of the two anchors (generally the lee one) used in mooring in the stream. To pick up either anchor, it is necessary to veer away on one cable as the other is hove in. After weighing one anchor, heave in to the proper scope on the other cable. The term *unmooring* is applied almost exclusively to this case, never to that of a ship moored to a dock.—*S. B. Luce, Captain U.S.N.*

Moot. A gauge for sizing tree-nails.

Mop. A young whiting.

Moppat. An early name for the sponge of a cannon.

Mopusses. A cant-term for money in general.

Mormyrus. A Linnæan genus of malacopterygious fishes, resembling the pike, found only in the rivers of Africa.

Morning Gun. The gun fired from the flagship to announce daybreak.

Morning Star. See VENUS.

Morrhua. A genus of fishes, including the common cod.

Morris, Charles, Commodore U.S.N. Born at Woodstock, Conn., July 26, 1784. Entering the navy in 1799, he made his first cruise as a midshipman in the "Congress"; his next cruise was in the "Constitution" (1803–5), under the famous Commodore Preble, in the war against Tripoli; he was in the attack on the "Philadelphia" in the harbor of Tripoli, under Decatur, and was the first of the boarders on the deck of the captured vessel, and also participated in all the attacks on Tripoli in the following summer. The next four years were passed in a short cruise in the "Hornet" in European waters, and on duty enforcing the embargo of Jefferson at Portland, Me. From 1810 to 1812 he cruised in the "Constitution." Soon after his return to the United States, and while still executive-officer of the "Constitution," with Hull as captain, the war of 1812 broke out, and he was on that vessel when she made her famous escape from a British squadron, and in the fight between the "Constitution" and "'Guerriere" he was wounded through the body. Upon his recovery he was promoted to a captaincy and given command of the "Adams," which vessel he commanded until she was destroyed at Hampden to avoid capture by the British. After the establishment of peace with England, Morris commanded the "Congress," in the war against Algiers. Upon his return, and while still in command of the "Congress," he was sent on a mission to Hayti and San Domingo, where he conducted important negotiations for the State Department. In 1819–20 he was sent with a squadron to Buenos Ayres on a mission of political importance. On his return he was appointed a navy commissioner, which high position he held for many years. In 1825 he commanded the "Brandywine," the vessel which carried Lafayette back to France. After leaving France he made a tour of inspection of the naval stations of France and England, returning to his position of navy commissioner in 1827. This position he held until 1841, except during two years when he was in command of the Boston Navy-Yard. For some years after this he was on duty in Washington as chief of the Bureau of Ordnance, and died at the age of 72, in 1856, while on that duty.

Morris. A fish of the genus *Leptocephalus*, resembling the eel, but having a very slender body compressed so far as to be thin and flat, like tape.

Morris-pike. A formidable Moorish weapon, the precursor of the boarding-pike.

Morse. See WALRUS.

Morsing Powder. An old term for priming-powder.

Mort. A salmon in his third year.

Mortar. A short piece of ordnance with large bore, used for throwing shells at high angles in order to reach objects by their vertical fire. They are used in the navy only under exceptional circumstances, the one pattern used being the 13-inch of 17,000 pounds, made of cast iron.

MORTAR-VESSEL. A vessel fitted for carrying and working a mortar. To enable the mortar to be properly manœuvred and to resist the recoil, the vessel should have considerable breadth in proportion to her length. The mortar is slung amidships in a massive bed. The ancient form of mortar-vessel was the bomb-ketch, convenient because of the length of deck without a mast.

Mortised Block. A block of which the shell is made of a single piece mortised out to receive the sheave.

Moruach. A peculiar seal, which has been frequently mistaken for a mermaid.

Moscow is situated on the Moskva River, is the capital of the government of Moscow, and one of the most important cities of Russia. Lat. 55° 45′ 21″ N.; lon. 37° 34′ E. Manufactures of various kinds are carried on to a great extent within the city, the principal of which are for textile fabrics, chiefly woolen, cotton, and silk. The other principal articles are hats, hardware, leather, chemical products, beer and brandy. From its central position Moscow is the great entrepôt for the internal commerce of the empire. Great facilities for this commerce are given by water communication, which extends on one side to the Baltic, on another to the Caspian, and on a third to the Black Sea, and by the important railways which centre here. Pop. 602,000.

Moses. A flat-bottomed boat used in the West Indies for bringing off hogsheads of sugar; it is termed single or double according to its size.

Moses' Law. The term among pirates for inflicting 39 lashes on the bare back,—forty save one.

Moses-seam. See MONK-SEAM.

Mosquito Fleet. An assemblage of small craft.

Moss-bunker. A name for the *hard-head* (*Alosa menhaden*).

Motella. A genus of fishes, including the whistle-fish.

Mother Cary's Chicken. The stormy petrel, *Procellaria pelagica.*

Mother Cary's Goose. The name given by Captain Cook's people to an oceanic brown bird, *Procellaria gigantea*, which Pernety calls *quebranta-huesos* (bone-breaker).

Mother-of-pearl. The iridescent nacreous inner layer of several species of shells, especially the "pearl-oyster" (*Meleagrina margaritifera*).

Motion. The relation between two points in space when a straight line joining them is changed in length, or in direction, or in both; its unit of measure is one foot or one degree of arc.

MOTION, PROPER. The motion of a heavenly body due to its own movement as distinguished from its apparent change resulting from a change in the position of the spectator. The term is technically used for such motion of a body as is independent of the earth's diurnal motion. Thus, the proper motion of the sun is his motion in the ecliptic as distinguished from his apparent motion in a diurnal circle; the former is the result of the earth's motion in her orbit, as the latter is of her diurnal revolution.

Motor. A mechanical contrivance to utilize force; a prime mover, such as a steam-engine, a water-wheel, or an electro-magnetic machine.

Mount. To place a gun on its carriage. To carry; as, a ship mounts 44 guns.

Mountebank. The *Gammarus arcticus*, or arctic shrimp.

Mourning. In the navy mourning is denoted by half-masting the ensign, narrow-pennant, broad-pennant, or the flag of an admiral, and by the firing of minute-guns. (See FUNERAL HONORS.) In the merchant service the colors are half-masted and the yards topped up. In early days, on special occasions the sides were painted blue.

Mouse. A bunch raised on a piece of rigging by means of spun-yarn, parcelling, etc., to prevent a running-eye from slipping. *To mouse a hook*, to take several turns of small stuff around the point and back of a hook to prevent its unhooking.

MOUSING. The small stuff used to keep a hook from unhooking.

Mouth. The opening of a port or outlet of a river.

Moving-sands. Synonymous with *quicksands.*

Mud-digger. A light-draft vessel fitted with appliances for dredging out a harbor or channel. A dredging-machine.

Mud-dredger. See MUD-DIGGER.

Mud-fish. The *Lepidosiren*, a very remarkable fish of the Gambia and other African waters.

Mud-hole. A covered opening in the bottom of a boiler, for removing dirt and sediment.

Mud-hook. A familiar term for an anchor.

'Mudian, 'Mugian, or Bermudian. A boat special to the Bermuda Islands, usually decked, with the exception of a hatch; from 2 to 20 tons burden; it is short, of good beam, and great draft of water abaft, the stem and keel forming a curved line. It carries an immense quantity of ballast. Besides a long main- and short jib-boom, it has a long, tapering, raking mast, stepped just over the forefoot, generally unsupported by shrouds or stays; on it a jib-headed mainsail is hoisted to a height of twice, and sometimes three times, the length of the keel. This sail is triangular, stretched at its foot by a long boom. The only other sail is a small foresail or jib. They claim to be the fastest craft in the world for working to windward in smooth water, it being recorded of one that she made five miles dead to windward in the hour during a race; and though they may be laid over until they fill with water, they will not capsize.

Mud-lands. The extensive marshes left dry by the retiring tide in estuaries and river mouths.

Mud-larks. People who grovel about bays and harbors at low water for anything they can find.

Mud-lighter. A flat-bottomed boat which receives the mud or other matter from a dredging-machine.

Mud-plug. A tapered plug, in the lowest part of the bottom of a boiler, which can be conveniently removed to allow the escape of mud and sediment.

Mud-valve. A valve placed in a pipe connected to the bottom of the boiler, or in the bottom itself, for the removal of mud and sediment, —much used in Western river steamboats.

Muffle. To deaden the sound of; as, to muffle a drum. When necessary to deaden the sound of the oars, as on a night expedition, thrum-mats or pieces of canvas are wrapped around the looms of the oars in the wake of the rowlocks or tholepins. Whaleboats have their oars muffled to avoid frightening the whales.

Mufti. Citizen's clothes. Officers are required to wear their uniform when on board ship, or when on duty at a navy-yard. When on shore they may wear citizen's clothes or their uniforms; but no portion of the uniform must be worn with citizen's dress.

Muggy. Half intoxicated; a sheet in the wind. Also used to express damp, oppressive weather.

Mullany, J. R. Madison, Rear-Admiral U.S.N. Born in New York, October 26, 1818. Appointed from New Jersey, January 7, 1832; attached to frigate "Constellation," Mediterranean Squadron, from February, 1832, to December, 1834; receiving-ship, and Naval School, navy-yard, New York, from June, 1835, to April, 1836; frigate "United States," Mediterranean Squadron, from May, 1836, to December, 1837; schooner "Shark," Mediterranean Squadron, from December, 1837, to March, 1838; Naval School, navy-yard, Norfolk, from March, 1833, to June, 1838.

Promoted to passed midshipman, June, 1838; naval rendezvous, New York, from November, 1838, to August, 1839; brigantine "Dolphin," coast of Africa, from August, 1839, to September, 1840; receiving-ship and rendezvous, New York, from October, 1840, to December, 1841; steam-frigate "Missouri," Home Squadron, from December, 1841, to July, 1842; receiving-ship at New York, from July, 1842, to April, 1843.

Commissioned as lieutenant, February 29, 1844; brig "Somers," West Indies, from April, 1843, to April, 1844; brig "Washington," coast survey, deep-sea soundings, and observations for temperature in Gulf Stream, from July, 1844, to May, 1847; brig "Washington," Home Squadron, from May, 1847, to August, 1847; active service on the Mexican coast during the Mexican war; took part in the attack on and capture of the city of Tabasco, June, 1847; brig "Wash-

ington," coast survey, from September, 1847, to May, 1848, engaged in deep-sea soundings, and observations for temperature in Gulf Stream; sloop-of-war "St. Louis," Brazil Squadron, from June, 1848, to April, 1849; frigate "Brandywine," Brazil Squadron, from May, 1849, to December, 1850; receiving-ship at New York, from April, 1851, to September, 1851; gunboat "John Hancock," special service on coast of United States, and in West Indies to search for filibustering vessels, from September to October, 1851; receiving-ship at New York, from October, 1851, to September, 1852; frigate "Columbia," West India Squadron, from September, 1852, to April, 1855; inspector of ordnance, navy-yard, New York, from May, 1855, to May, 1858; brig "Arctic," special service, West Indies, from May to August, 1858; frigate "Niagara," as executive-officer, special service, coast of Africa, from September to December, 1858; frigate "Constellation," as executive-officer, fitting her for sea, April and May, 1859; frigate "Sabine," as executive-officer, West India Squadron, May, 1859, to December, 1860; frigate "Sabine," off Pensacola, commencement of war, from January to March, 1861, assisting in the protection of Fort Pickens; commanded gunboat "Wyandotte," April and May, 1861, occupying a position inside of the harbor of Pensacola, in rear of Fort Pickens, to aid in protecting it from a threatened attack from the enemy; assisted in towing in the boats and landing forces, composed of sailors and marines, April 12, 1861, reinforcing Fort Pickens; commanded store-ship "Supply," Home Squadron, May and June, 1861, off Pensacola, and during passage to New York; inspector of ordnance, Fort Pitt Foundry, Pittsburgh, and other places, from July, 1861, to March, 1862.

Commissioned as commander, October 18, 1861; commanded steamer "Bienville," North Atlantic and West Gulf Squadrons, from April, 1862, to May, 1865,—except as hereafter noted,—frequently engaged with, and coming under the fire of the forts off Charleston and other points on the Southern coast.

Arriving in command of the "Bienville" off Mobile shortly before the battle of August 5, 1864, volunteered his services for the engagement then being planned. The "Bienville" not being considered by Admiral Farragut a fit vessel to engage the forts, he was assigned by Admiral Farragut to the command of the "Oneida," which, on the passing of Fort Morgan, occupied the side exposed to the fire of the fort, the "Galena" being lashed to the opposite or port side, and being under his control by virtue of his seniority. The "Oneida" occupied the rear of the line of battle, and was exposed to a very destructive fire from Fort Morgan. The first shell by which she was struck entered the ship just under the mizzen rigging, killing the cabin steward, cutting the wheel-ropes, and setting the cabin on fire. The steering-gear being promptly repaired, the vessel was again struck, the shot exploding the starboard boiler and scalding 16 men. The "Oneida" was partly disabled by this shot, but steam on the port boiler was still available, and sufficed to move the ship.

As rearmost vessel, the ship was exposed to a very heavy fire for some time after she was able to return it, owing to the fact that she had passed too far beyond the fort to be enabled to train her guns sufficiently aft to bring them to bear on it.

When nearly free from the fire of Fort Morgan, the "Oneida" was assailed by the ram "Tennessee," with whom she exchanged shots in passing. The latter, coming up under her stern, was enabled to rake her, one shot visiting serious loss upon the ship, and inflicting several severe wounds upon Commander Mullany, one of which necessitated the amputation of his left arm.

Up to this time he had exercised active command of the two vessels, standing upon the poop and "conning" the ship, and encouraging the crew by voice and example. After this injury the vessel was not again struck, and the engagement, as far as the "Oneida" and "Galena" were concerned, terminated.

While commanding the "Bienville," off Charleston, 1862, captured steamers "Stettin" and "Patras," under English flag, loaded with munitions of war, vessels and cargoes valued in the aggregate at half a million dollars. Also captured 9 schooners from Nassau, all under English colors.

Commanded division of West Gulf Squadron, extending from Sabine Pass to Rio Grande, from April to September, 1863.

While in the "Bienville," off Galveston, Texas, sent in boat expedition, and captured and brought off two schooners with 576 bales of cotton.

Inspector in charge of ordnance at navy-yard, New York, from May, 1865, to May, 1868.

Commissioned as captain, July 25, 1866; special duty as one of Board of Visitors to Naval Academy, May and June, 1868; special duty on board to select sites for powder-magazines, Portsmouth, N. H., Boston, and New York, June and July, 1868; court-martial duty at New York, August, 1868; commanded sloop "Richmond," European Squadron, December, 1868, to November, 1871.

Commissioned as commodore, August 15, 1870; commanded Mediterranean Squadron, European Fleet, from October, 1870, to November, 1871; occasional court duty from November, 1871, till September, 1872; commanded navy-yard, Philadelphia, from October, 1872, to June, 1874; in addition to which, commanded Naval Station, League Island, from April, 1873, to June, 1874.

Commissioned as rear-admiral, June 5, 1874; commanded North Atlantic Station from June, 1874, to February, 1876; during this period was engaged with portion of squadron at New Orleans from September, 1874, to March, 1875, acting in co-operation with Gen. Emory, and afterwards with Gen. Sheridan; in September and October, 1875, was at Aspinwall with his flagship and one other vessel of squadron, to protect American interests on the Isthmus, then menaced by the rebellion in the state of Panama. Was authorized by Navy Department at this time to command for the purpose the vessels of the South Pacific Squadron, then in the harbor of Panama, consisting of the flag-ship "Richmond" and the "Omaha"; Naval Asylum and station, Philadelphia, as governor, from March 1, 1876, to October 26, 1879, when he was retired.

Mulet. A Portuguese craft with three lateen-sails.

Mullet. A well-known fish, of which there are several species. The gray mullet, *Mugil*

capito, and the red mullet, *Mullus surmuletus*, are the most common.

Mulls. The nickname of the English in Madras, from mulligatawney having been a standard dish among them.

Mulrein. A name in the Firth of Forth for the frog-fish, *Lophius piscatorius*.

Multiple Star. When several stars appear in close proximity to each other they are spoken of, collectively, as a multiple star.

Multi-tubular Boiler. A boiler in which the water passes through a large number of tubes of small diameter. Object, rapid circulation and increased generation of steam.

Mumbo Jumbo. A strange minister of so-called justice on the Gold Coast, who is usually dressed up for the purpose of frightening women and children. He is the arbiter of domestic strife.

Mummy-chog. A small fish of the carp kind.

Munduc. A sailor employed in the pearl-fishery, to haul up the diver and oysters.

Mundungus (from the Spanish *mondongo*, refuse, offal). Bad, rank, and dirty tobacco.

Munition. Military or naval stores of every description. *Munition ships* are vessels which carry military and naval stores, and attend or follow a fleet to supply ships of war.

Munjak. A kind of pitch used in the Bay of Honduras for vessels' bottoms.

Munnions. Pieces placed up and down to divide the panels in framed bulk-heads.

Muræna. An eel-like fish, very highly esteemed by the ancient Romans.

Mural Circle. A circle of metal, which, as it turns on a pivot, keeps the telescope always in the meridian; the circle is accurately graduated on its rim. When the telescope is horizontal, a stationary index points to zero on the circle; as the telescope is moved a portion of the circle passes by the index, which thus shows the amount of elevation.

Murderer. The name formerly used for large blunderbusses, as well as for those small pieces of ordnance which were loaded by shifting metal chambers placed in the breech.

Murex (Lat. *murex*, a shell-fish). A name applied by Linnæus to a genus of gasteropodous mollusks having a univalve spiral shell, with an oval aperture ending in an entire, straight, or slightly ascending canal. The mollusks thus characterized form a family (*Muricidæ*, or rock-shells), belonging to the order *Pectinibranchiata* of Cuvier. The *Muricidæ* all prey on other mollusks, boring through the shells with their hard-toothed proboscis. Species are found in all parts of the world, the largest in tropical regions. Some, from the length of the beak, are called "woodcock shell." Some have the shell beset with long and regularly arranged spines. The whorls of the shell are marked with ridges or *varices*. The celebrated dye of the ancients, called Tyrian purple, was derived from species of the *Muricidæ*. Another species—*Muricidæ tribulus*—is the "Venus Comb" of the Indian Seas, a very delicate and beautiful shell, with numerous long, thin spines. Fossil *Muricidæ* are numerous, but are seldom found in any formation older than the eocene tertiary.

Murlock. The young pickled dog-fish.

Murray, Alexander, Rear-Admiral U.S.N. Born in Pennsylvania. Appointed midshipman August 22, 1835; served three years in West Indies; 1839 and 1840, Seminole war. Passed midshipman in 1841, and returned to Seminole war; joined the Pacific Squadron in 1843; was made acting lieutenant, and served in the "Shark," "United States," and "Levant," and returned home in 1845. In 1846 joined the Gulf Squadron, and was at the battles of Alvarado, Tabasco, Vera Cruz, Tuspan, and Tampico; was slightly wounded at Alvarado.

Commissioned lieutenant in August, 1847; served on coast survey until 1849, when he joined the razee "Independence," Mediterranean Squadron; returned to United States in 1851. In January, 1852, appointed to command the steamer "Fulton," and sailed, with Vice-President King on board, for the West Indies; after visiting two or three ports, Mr. King's health demanded his return, and the "Fulton" landed him at Mobile, where he died in a few days; the "Fulton" returned to Norfolk in May; served on board the "Pennsylvania" (receiving-ship) until 1853. Appointed to command the surveying steamer "Bibb"; joined the frigate "Cumberland" in 1860 as executive-officer, and after arriving at Vera Cruz was appointed to command the "Pocahontas"; was detached in Norfolk, and returned to the "Cumberland" without orders; was present at the burning of the navy-yard. Appointed to command the steamer "Louisiana," August 3, 1861; had a conflict, and repulsed the rebel steamer "Yorktown" off Newport News, September 20; October 5 had another fight, in Cocklin's Creek, Eastern Shore, resulting in the destruction of a vessel being equipped as a privateer; participated in the battles of Roanoke Island, February 9, of Elizabeth, February 10, of Newbern, N. C., February 14; was appointed senior officer in York and Pamunkey Rivers; co-operation with the army in its movement on Richmond.

May 17, 1862, pushed up the river in advance of the army, and, aided by some volunteers from the army in small transports, forced the enemy to destroy his transports, 17 vessels in all, 2 of them steamers. Battle was not offered, though he sighted the enemy at many points.

Commissioned commander on July 16, 1862; ordered to navy-yard, Portsmouth, N. H.; November, 1862, was ordered by telegram to return to sounds of North Carolina as senior officer; attacked Kingston, N. C., to create a diversion in favor of the army, which was moving on Goldsboro'; February 14, with the gunboats repulsed the attempt of the enemy to recover Newbern; April, 1863, ordered to resume duties at Portsmouth Navy-Yard; September, 1865, appointed to command "Rhode Island"; and October 24, sailed for Havana with tender "Hornet" and crew for "Stonewall," which Commander Murray had been directed to receive from authorities in Havana; November 24, 1865, returned to Washington, bringing "Stonewall"; May 6, 1866, sailed from New York with "Augusta" (side-wheel), "Miantonomah" (double-turret), and "Ashuelot" (double-ender), for Russia.

Promoted to captain, July 25, 1866; in July, 1867, the expedition returned to United States, having, in company with the monitor, visited the Mediterranean and West Indies, after leaving the Baltic; navy-yard, Philadelphia, 1868–69; light-house inspector, 1870–72.

Promoted to commodore, April, 1871; member of Light-House Board until June, 1866.

Promoted to rear-admiral, April 26, 1876, and ordered to command Pacific Fleet; May 1, 1878, retired at his own request after forty years' "faithful service," under act March 3, 1873, the admiral's service in the Pacific being highly commended by the Navy and State Departments in official documents.

Musca. See CONSTELLATION.

Muscat is a seaport of great commercial importance on the Indian Ocean, near the eastern angle of Arabia, in lat. 23° 34′ N., lon. 58° 50′ E. The cove of Muscat, as the harbor is called, is an inlet of the sea about three-quarters of a mile long by one-half of a mile wide, opening to the northwest, and completely sheltered from the prevailing monsoons. The excellence of its port and its convenient position near the entrance of the Persian Gulf make it important as a station for shipping. The docks for building and repairing shipping are situated at Muttra, at the foot of the bay, about 3 miles from Muscat. The imports of Muscat consist chiefly of almonds, aloes, sulphur, nitre, coffee, etc., from Persia and Africa, most of which are re-exported. Large quantities of dates, wheat, horses, and fish are among the exports. Population of Muscat, Muttra, and intervening villages is about 50,000.

Musgum, or Misgurn. A kind of fish resembling the eel in size and form.

Mushroom-anchor. An anchor with a head like a mushroom, and having no stock; it is used for permanent moorings. See ANCHOR.

Musketoon. A short kind of blunderbuss with a large bore, to carry several musket- or pistol-bullets. It was much used on boat-service. They were mounted on several crutches, and termed top-pieces or quarter-pieces in barges and pinnaces, where timbers were especially fitted for them.

Muster. When all hands are called to muster, the men assemble on the port or lee side of the quarter-deck, and the officers on the opposite side. If, after the special purpose for which the crew has been assembled has been accomplished, it be desired to call the roll, the petty officers form a line in the opposite gangway, where they are mustered by the paymaster's clerk. Having finished with the muster of the petty officers, the remainder of the crew is mustered, beginning with the seamen. As each man's name is called, he takes off his cap, crosses the deck, and walks forward. At muster, the officer of the deck accounts for those on duty, the master-at-arms for those in confinement, and the apothecary for the sick. Every person unaccounted for is so entered in the log-book. *To muster the watch*, to call the names of the watch, in order to make sure that all are on deck; this duty is done by the junior officer of the watch just after 8 bells, and as often thereafter as the officer of the deck directs. *To pass muster*, to pass inspection; to answer the purpose intended.

Mute. A prisoner arraigned before a court-martial, when called upon to plead, may, through obstinacy, remain silent. This is technically termed *standing mute*. In such a case the court proceeds with the trial as though a plea of not guilty had been made. The same course is pursued in cases where the prisoner, instead of pleading properly, answers foreign to the purpose with the deliberate design to obstruct the proceedings.

A prisoner may stand mute by the visitation of God, in which case, if it be only an inability to articulate, the court proceeds as above.

By the common law of England, obstinately standing mute, upon arraignment for certain species of offenses, was deemed equivalent to conviction, upon which judgment followed.

Mutiny. An insurrection against constituted authority, particularly military or naval authority. An open and violent resistance to the authority of officers. It may be the act of an individual or the concerted action of several. The Articles for the government of the navy provide that any person in the navy who makes, or attempts to make, or unites with, any mutiny or mutinous assembly, or who being witness to or present at any mutiny does not do his utmost to suppress it; or who, knowing of any intended mutiny or mutinous assembly, does not immediately communicate his knowledge to his superior or commanding officer, shall suffer death or such other punishment as a court-martial may adjudge.

MUTINY ACT. An English statute for the government of military persons, and vesting in the crown power to frame articles of war.

The occasion that gave rise to the Mutiny Act was a rebellion on the part of some English and Scotch troops in the first year of William and Mary's reign, upon their being ordered to Holland to replace some of the Dutch troops which King William had brought over with him, and intended to keep in England. The Scotch were disgusted because Lord Dumbarton had been supplanted in the command of one of their regiments by Marshal Schomberg, and the disaffection of the English was occasioned by emissaries of James, who intimated to them that they were being ordered out of the country because of their fidelity to their late sovereign. King William immediately communicated this event to both houses of Parliament, who readily agreed to give their sanction to punish the insurgents; and on the 3d of April, 1689, passed an act for punishing mutiny and desertion, and establishing a code for the general government of the army, which was to continue in force till November following, and no longer. It was, however, renewed again the next January, and has, with the interruption of about three years only, in the peaceable part of King William's reign, viz., from the 10th of April, 1698, to the 20th of February, 1701, been annually renewed since, with occasional alterations and amendments.

The Mutiny Act was the first regularly enacted statute ever passed in England for the regulation of the military state, and may therefore with propriety be considered as the original of *military* in contradistinction to *martial* law. (See MARTIAL LAW.) It formed the model of our own Articles of War, though, unlike it, our Articles are not limited to one year's duration, necessitating, as in the case of the Mutiny Act, their annual re-enactment.

Mutton-snapper. A large fish of the *Mesoprion* genus, frequenting tropical seas, and prized in the Jamaica markets.

Muzzle. The forward extremity of a piece of ordnance.

MUZZLE-BAG. A painted canvas-bag placed over the muzzle of broadside-guns at sea to keep the water out.

MUZZLE-LASHING. The rope which confines the muzzle of a gun when housed.

Muzzy. Half-drunk.

Myopara. An ancient corsair's vessel.

Myrmidon (from *mur-medon*, a sea-captain). The Myrmidons were a people of Thessaly, said to have first constructed ships.

Mystico. A Greek piratical boat. See MISTICO.

Myth. Obelisk, tower, land, or anything for directing the course by sight.

N.

N. Abbreviation for *not* in the U. S. General Service Signal Code.

Naca, or **Nacelle.** A French row-boat used as early as the twelfth century.

Nacta. A small transport of early times.

Nadir. The inferior pole of the celestial horizon. It is the point of the heavens vertically under a spectator's feet,—the vertex of the invisible hemisphere. The nadir is diametrically opposite to the *zenith*.

Nagasaki, on the southwest side of the island Kioo-Sioo, Japan, in lat. 32° 44′ 8″ N., lon. 129° 51′ 33″ E., is one of the import seaports of the empire. The harbor is about 7 miles long by 1 mile wide, with good anchorage, securely sheltered, in from 5 to 7 fathoms of water. It has a large European and Chinese trade, and is also the supply station for U. S. men-of-war, as the naval store-house for the Asiatic Station is located here. Pop. about 70,000.

Naides. A natural order of endogenous plants found in the ocean, and also in lakes and streams.

Nail. *To nail a gun*, to spike it.

Nake. The old word to unsheath swords, or make them naked.

Naked. State of a ship's bottom without sheathing.

Nakhadah, or **Nacodah.** An Arab sea-captain.

Name-board. The arch-board, or part whereon the ship's name and port are painted.

Nancy Dawson. A popular air by which seamen were summoned to grog.

Nankin. A species of cloth used for making working-clothes, and for facings for cuffs and collars.

Nantes, on the river Loire, at the confluence of the Erdre and Sèvre-Nantaise, is the capital of the department of Loire-Inférieure, and one of the principal cities of France. Merchant vessels are built here, and the town has numerous manufactories of cottons, muslins, cordage, etc.; also an extensive maritime commerce, although the harbor receives only small vessels, large vessels being compelled to unload at Paimbœuf. It possesses among its many institutions a tribunal of commerce, a hydrographical school, and a magazine of munitions for the marine. Pop. 123,000.

Naphtha. A very inflammable, fiercely-burning fluid, which oozes from the ground or rock in many different localities, and may be obtained by the distillation of coal, wood, and other substances.

Naples, the most populous city of Italy, is situated on the Bay of Naples, at the foot of Mount Vesuvius, in lat. 40° 51′ 8″ N., lon. 14° 15′ 5″ E. The city is surrounded by walls, and defended by three castles, St. Elmo, Nuovo, and Del Ovo. Immediately adjoining is a large arsenal and cannon-foundry. The city contains a royal marine hospital, ship-building yards, and a military school. The most important manufactories are those of macaroni, vermicelli, silk stuffs, fire-arms, chemical products, etc. Although the Bay of Naples is very extensive, the harbor proper is of small dimensions, and the water near the town is only deep enough to float shallow vessels. It is a regular stopping-place for the Mediterranean steamers. Pop. 450,000.

Narke. A ray of very wonderful electric powers.

Narrowing of the Floor-sweep. For this peculiar curve, see RISING HALF-BREADTH.

Narrows. The most confined part of a channel between two lands; any contracted part of a navigable river.

Narwhal. The *Monodon monoceros*, an animal of the cetacean order, found in the Arctic seas, and distinguished by the single long pointed tusk projecting straight forward from its upper jaw, whence it is also termed *sea-unicorn*.

Nath. The name of the bright star *β Tauri*.

Naturalization. The process by which an alien is made a citizen. By Art. I., Sec. 8, of the Constitution of the United States, Congress is vested with power "to establish an uniform rule of naturalization," and although formerly it was held by some that the State governments possessed a concurrent authority with the United States upon the subject of naturalization, it has now long been settled that the power vested by the Constitution in Congress respecting naturalization is exclusive. The power to admit to citizenship aliens desiring naturalization has been committed by Congress to the various courts of record, both Federal and State having common law jurisdiction. The naturalized citizen of the United States enjoys all the privileges and immunities of the native-born, save only eligibility to the office of President.

The process of naturalization in the United States consists in the declaration, on oath or affirmation by the alien, before a court of competent jurisdiction, or the clerk of such court, of his intention, *bona fide*, to become a citizen of the United States, and his renunciation of all

allegiance to any foreign prince or power, and particularly of his allegiance to the sovereign or state of which he is at the time a subject; which declaration and renunciation must be made at least two years before his admission to citizenship. At the time of his application for admission he must further declare, in the same manner and form, that he will support the Constitution of the United States, and make a further absolute and entire renunciation of all allegiance and fidelity to every foreign prince, potentate, state, or sovereignty whereof he was before a citizen or subject; and of these proceedings the clerk of the court makes record. The court, before admitting the alien, must be satisfied by evidence, other than that of the applicant himself, that he has resided in the United States five years at least, and in the State or Territory wherein the court is held, at least one year; and it must further appear that during that time he has behaved as a man of good moral character, attached to the principles of the Constitution of the United States, and well disposed to the good order and happiness of the same. If the alien shall have borne any hereditary title, or been of any of the orders of nobility, in the kingdom or state from which he came, he must make renunciation of the same. The previous declaration of intention is dispensed with in the case of an alien who, being a minor, shall have resided in the United States three years next preceding his coming of age, and who shall have continued to reside therein to the time of his applying for admission to citizenship, but, including the three years of his minority, he must have had a continuous residence of five years, and at the time of his admission he must declare on oath or affirmation that for the three years next preceding it has been his *bona fide* intention to become a citizen of the United States. If an alien who has declared his intention dies before he is actually naturalized, his widow and children are considered citizens, and shall be entitled to all rights and privileges as such upon taking the oaths prescribed by law. The children of persons duly naturalized, who were minors at the time of their parents' admission to citizenship, are, if dwelling in the United States, considered as citizens; and the children of persons who now are, or have been, citizens of the United States, are citizens; but the rights of citizenship cannot descend to persons whose fathers have never resided in the United States. The naturalization of a father *ipso facto* makes his son then residing in the United States, and under 21 years of age, a citizen. No alien who shall be a native, citizen, denizen, or subject of any country, state, or sovereign with whom the United States shall be at war at the time of his application can be then admitted to be a citizen of the United States. A seaman, being a foreigner, having declared his intention of becoming a citizen of the United States in any competent court, and having served three years on board a merchant vessel of the United States subsequent to the date of such declaration, may be admitted to citizenship on making application to any competent court, and producing his certificate of discharge and good conduct, together with the certificate of his declaration of intention. This provision does not extend to seamen in the naval service. Admission to citizenship does not necessarily carry with it the right to vote. The elective franchise is regulated by the several States, each for itself, the only restriction imposed by the Federal Constitution being that contained in Art. XV., Sec. 1, that "the right of citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude."

Natural Projections. Perspective delineations of a surface on a given plane. They are formed by drawing from the eye straight lines, indicating the visual rays, through every point of the surface to meet the plane. The original and the representation produce the same effect on the organ of vision. Examples,—the orthographic, stereographic, and central projections of the sphere.

Naumachia. The appellation given by the Romans to a spectacular diversion consisting in a naval engagement which usually took place in theatres (called also naumachiæ) made especially for the purpose. These exhibitions were originally instituted for the purposes of naval discipline, but in process of time only malefactors or captives whose lives had been forfeited participated in them. They appear to have been conducted on a scale of such magnificence as almost to exceed belief. Within the places set apart for them whole fleets went through their evolutions without inconvenience or confusion, and all the appliances of human ingenuity were put in play to give an air of reality to the representation. Suetonius narrates that in an exhibition of this sort given by Nero, sea-monsters were seen swimming about in the artificial lake; and in the sea-fight on the lake Fucinus, given by Claudius, there are said to have been no fewer than 19,000 combatants. Julius Cæsar appears first to have given a naumachia on an extensive scale; his example was followed by many of his successors on the imperial throne; and at last they were frequently exhibited at the expense of private individuals as a means of increasing their popularity.

Nauropometer. An instrument for measuring the amount of a ship's heel or inclination at sea.

Nauscopy. The tact of discovering ships or land at considerable distances.

Nautical (Lat. *nauta*, Gr. *nautēs*, a seaman; Lat. *navis*, Gr. *naus*, a ship). Belonging to ships; pertaining to a seaman's business. The term is applied in a general, comprehensive sense; thus, *nautical science* includes the two branches of *navigation* and *seamanship*.

Nautical Almanac. See Almanac, Nautical.

Nautical Astronomy. That part of astronomy made use of in navigation.

Nautical Day. See Day, Nautical.

Nautical Mile. See Mile, Nautical.

Nautical School-Ships. See School-Ships, Nautical.

Nautical Stars. The bright stars used by navigators in observations for the determination of latitude and longitude.

Nautical Tables. Tables especially computed for the solution of problems in navigation.

Nauticum Fœnus. Marine usury; bottomry.

Nautilus. The pearly nautilus, *N. pompilius*, is a marine animal, belonging to the same class (*Cephalopoda*) as the cuttle-fish, but protected by a beautiful, chambered, discoid shell. The paper-

nautilus (*Argonauta argo*) belongs to a different family of the same class, and has a simple, delicate, boat-like shell.

Naval. Pertaining to ships. Of, or belonging to, the navy.

Naval Apprentice. See NAVAL TRAINING SYSTEM.

Naval Architecture. See SHIP BUILDING.

Naval Brigade. In a preceding article on "landing-parties," the equipment and organization of men from single ships, for operations on shore, has been treated. It has been customary in the service to give the name of "naval brigade" to even a single ship's company, although by rights it refers to a larger organization. We shall treat it in its true meaning, although what applies to it will be found applicable on a reduced scale to smaller parties.

The ships of a squadron being assembled for offensive operations, and each ship having a battalion organization, the organization of the brigade becomes a very simple matter. In modern armies the tactical unit is the company, having a war strength sometimes as high as 250 men. As the naval company is necessarily small, on account of the limited number of officers and the comparative want of experience of the men, the battalion of four such companies would seem to furnish a good basis. The larger ships would each furnish a full battalion, any companies remaining over being joined with those of the smaller ships to complete their quota,—the marines forming a battalion under their own officers. Arrangements should also be made to form a brigade supply-corps and brigade hospital. The artillery should be formed into batteries of two or three platoons each, care being taken to have the guns in each battery of the same class. An artillery supply-train must also be organized.

The naval brigade is commanded by a commodore or captain, assisted by a staff consisting of an adjutant-general, an ordnance-officer, a signal-officer, a paymaster, a surgeon, and several aids. Attached to the headquarters are a squad of orderlies and signalmen, one of whom carries the headquarters flag, which should always mark the point where the commander-in-chief is to be found, but should not be so conspicuous as to draw the enemy's fire.

The battalions should each have two field-officers, an adjutant, and a paymaster; the batteries one field-officer, an adjutant, paymaster, and gunner.

Landing.—All the details of organization having been completed, such as the assignment of companies and guns, the appointment of commanders of battalions and batteries, the assignment of battalions and batteries to positions in line, the amount of ammunition and stores to be carried by the men, the amount for the brigade supply and for the base of operations, the detail of ships to cover the landing, or in the absence of such ships, the fitting out and arming of such small vessels as may be available. In the absence of either, when the landing is to be in force, beyond the range of the ship's guns, gun-rafts should be built, on which some of the lighter ship's guns or heavier howitzers should be mounted behind hammock breastworks. At any rate, some of the large boats should be fitted to carry the heavy howitzers and to act as gunboats. The boats should all be distinctly numbered on each bow and on the stern. Each boat should be provided with a good anchor and long cable. The force is divided into fighting line, supporting line, and reserve line. Writers on this subject generally advocate the use of the marines for the skirmish or fighting line, the reason being that the marines are supposed to be better drilled in skirmishing. This may be the fact, but it should not be so, as blue-jackets can be just as well instructed when there is a desire to do so. The marines are undoubtedly the best-disciplined infantry, and should, therefore, form the reserve. If it is decided to assign the marines to the fighting line, they should be put in boats by themselves, pulled by men from the reserve battalions, unless the marines have been instructed in rowing, as they certainly should be. All the large boats should have four, and the smaller ones two, boat-keepers, armed as riflemen. The steam-launches and permanent covering-boats should have regular crews. An officer, with assistants, should be assigned to the command of the boats and boat-keepers.

The men to form the expedition having been thoroughly inspected on board their ships, signal should be made for them to embark in their boats. The lines should then be formed in order that all may learn their stations. When all is ready to start, the boats should be taken in tow by the steam-launches or small vessels. The tows should proceed in the order most convenient for reforming the lines. The artillery-boats should be on the flanks, and in rear of the centre of the line. A convenient method of towing artillery-boats near the enemy is to lash one on each side of the towing boat.

The circumstances under which a landing has to be made are so variable that no general rule can be laid down. We will discuss the two which seem the best to cover the subject: 1st, landing on the water front of a town; and, 2d, landing on a beach,—the enemy opposing the landing in both cases.

On approaching the town the covering-vessels will take up position so that they can shell the landing, and at the same time cover the land-approaches to prevent the arrival of reinforcements. The artillery-boats will then advance and take up positions to clear the landing and command the principal streets and buildings likely to shelter the enemy's riflemen. The sea-force having been well shelled, the first line of infantry will pull in to the best landing-places; once ashore, the first line of buildings will be occupied and manned on the land side. The second line will now pull in and land; forming under cover of the buildings, they will prepare to move up as many of the streets normal to the shore as possible. The light guns and machine-guns will now be landed. Some will be placed in position on the first line of buildings, others will join the different street columns. The reserve will now be landed and massed so as to move by the principal thoroughfares. The advance will then be sounded. The first line will move through the buildings to the front, dislodging all of the enemy's men. The second line will move in support of the first through the streets, extending wherever it is found possible, and clearing all the streets parallel to the shore. Care must be taken to keep up a good line of communication. The reserves will support the

second line, and will be prepared to reinforce any point of the fighting line which may be hard pressed. In moving up streets it will be found best to have the men remain close to the houses, taking advantage of the shelter offered by door-steps, doorways, etc. The men on the right side of the street must dislodge any of the enemy who may appear in the windows or on the roofs on the left side, and *vice versa*. In case the enemy exposes masses of men, the machine-guns must be brought up. If barricades are met, counter-barricades must be erected as soon as possible and the howitzers brought up.

On approaching a beach, the covering-vessels must take position so as to enfilade any work which the enemy has erected, and to command the approaches. The artillery-boats must clear the beach and sand-hills of bushes backing them. The first line must then land, contending as skirmishers and taking possession of the first line of sand-hills. The second line and light guns must then land and occupy the positions taken by the first line, the first line advancing to new positions if possible. The reserve will then land and the enemy will be attacked in force. The first line will be in extended skirmish order, the second in line in single rank, the reserve in column of fours or double column of fours. The artillery will take up and maintain the most commanding positions which can be found, and, having gotten a good position, will retain it until the range becomes too great. Great care will be taken to have all persons who are not actually engaged kept as much under cover as possible; this not only protects the men, but deceives the enemy. The reserve should be kept constantly intrenching itself, and the advance should do the same whenever it is possible and does not retard the movement.

In both cases, as soon as the main body has moved to the front, the boats should be placed so as to render an embarkation as speedy as possible. Off a beach it will be found best to anchor and have a hauling-line to the shore from the stern, the cable being long enough to run into the beach. The boat-guard will then throw up rifle-pits along the first line of sandhills or barricade the first line of houses and street openings as the case may be.

In case of a retreat, the first troops at the landing will relieve the boat-guards, who will proceed to the boats.

If the objective-point of the landing is inland and necessitates a regular campaign, the greatest care must be taken to observe all the precautions and provide all the essentials which would be observed and provided by regular land-troops.

Every means should be taken to collect wheeled transportation, and draft animals, not only for the wagons, but for the guns. If possible, the field-officers and a number of marines, or other men who can ride, should be mounted as orderlies and videttes.

The column should never move without a regular advance- and rear-guard and flankers. Scouting-parties should be sent out in all directions. The artillery should be massed in the centre with the baggage, a few of the lighter guns being detailed to the out-guards.

If it is found necessary to bivouac, the ground should be selected in regard to its defensibility, its healthiness, and its nearness to water. Strong lines of sentinels and outposts should be established to guard against surprise.

When the main body is in a valley or gorge, the heights should always be occupied.

For those who wish to prepare themselves more thoroughly for naval brigade duties we would recommend a perusal of portions of the "Ordnance Instructions," 1880; Cook's "Gunnery," 2d edition; Bedford's "Sailors' Pocket-Book," 3d edition; Worsley's "Soldiers' Pocket-Book," etc.—*Theo. B. M. Mason, Lieutenant U.S.N.*

Naval Chaplain. The origin of the title chaplain is said to be this. St. Martin divided his cloak with a naked beggar whom he found perishing with cold at the gate of Amiens. The cloak, miraculously preserved, was carried by the French monarchs as a sacred banner. The oratory in which this cloak or cape (French, *chape*) was preserved acquired the name "*chapelle*," and the person intrusted with its care was termed "*chapelain*," and thus, according to Collin de Planey, came our words "chapel" and "chaplain." The office of chaplain is one of the most ancient in the British navy, being almost coeval with its establishment. In a report of the commission appointed to inquire into the state of the navy in 1618, it is shown among other abuses that "in the narrow seas there is an allowance demanded for a preacher and his man, though no such devotion be used on board." July 26, 1620, George, Duke of Buckingham, wrote to the University of Cambridge in behalf of the appointment of Daniel Ambrose to one of the king's ships, and about the same date there was a grant of groats from the seamen's wages to chaplains. In 1678, Henry Teonge was chaplain of the "Bristol," 48, who, though fond of "piggs," "ghoose," and that "strange liquor, punch," which he first tasted on board, was evidently an honest, pious, and orthodox Parson Adams of the sea. His Diary, when chaplain on board the "Assistance," "Bristol," and "Royal Oak," 1675 to 1679, first published in 1825, is a most amusing book, as well as portrait of a chaplain in the royal navy 200 years ago. He says in the beginning: "May 20, 1675.—This day I began my voyage from my house" "with small accoutrements, saveing what I carried under me in an old sack." "My steed like that of Hudibras." (23d) "My stock of moneys was also proportionable to the rest, being little more than what brought me to London in an old coate, and britches of the same, an old payre of hose and shoes, and a leathern dublett of 9 yeares olde and upward. Indeed, I had (by reason of the suddennes of my jurny) nothing but what I was ashamed of, save only

> 'An old fox broade-sword, and a good black gowne;
> And thus Old Henry cam to London towne.'"

Chaplains have been in the U. S. navy almost from its commencement. We find Elie Vallette a chaplain February 26, 1800, discharged June 8, 1801, under the Peace Establishment Act. Rear-Admiral Elie A. F. Vallette, or La Vallette, as subsequently called, was appointed a lieutenant December 19, 1814, and was probably his son.

At the present time (1880) there are 24 chaplains on the active list in the U. S. navy, 4 holding the relative rank of captain, 7 the rank of commander, 13 the rank of lieutenant. On the

retired list, 6 with the rank of captain, and 1 with that of commander.

Naval Constructors. The first naval constructor of the U. S. navy who was appointed under the War Department before the Navy Department was established was Joshua Humphreys, who died or retired from office October 26, 1801. His son, Samuel Humphreys, succeeded him, and died in office August 16, 1846. There are now (1880) in the service on the active list:

One chief constructor with the relative rank of commodore.

Two naval constructors with the relative rank of captain.

Three naval constructors with the relative rank of commander.

Five naval constructors with the relative rank of lieutenant.

One assistant naval constructor with the relative rank of lieutenant.

Four assistant naval constructors with the relative rank of master.

And on the retired list:

One chief naval constructor with the relative rank of commodore.

Three naval constructors with the relative rank of captain.

Naval Crown. One of the nine crowns in heraldry, consisting of a rim of gold or silver, round which are placed alternately prows of galleys and square sails. It is said to have originated with the Roman emperor Claudius, who, after the conquest of Britain, instituted it as a reward for maritime services. He who first boarded an enemy's ship, and was the occasion of its being captured, was entitled to a naval crown.

Naval Hoods. Those hoods wrought above and below the hawse-holes, outside a ship, where there are no cheeks to support a bolster.

Naval Hospital, Brooklyn. The United States Naval Hospital Establishment for the New York Station is in Brooklyn, half a mile to the eastward of, but separated from, the navy-yard. It occupies the hill portion (56 feet above tidewater) of the Schenck farm, purchased by the government in 1820. The grounds, inclosed by a high and substantial brick wall, comprise 20 acres, laid out in lawns, walks, flower- and kitchen-gardens, with an abundance of well-grown shade- and fruit-trees.

At first the family mansion and farm buildings were metamorphosed and extended so as to answer the hospital requirements of our adolescent navy, and it was not until 1828 that the main building of the present hospital became ready for occupancy. This edifice, 200 by 60 feet, is two stories, with full basement and attic. There were added to it in 1840 two wings, each 73 by 49 feet, of same height as main building; and at the same time was built a "pest-house" of uniform height and style,—this latter structure was subsequently transformed into the naval laboratory, and an ample building for pestilential diseases located more remotely. By another change the dead-house was converted into a tasteful chapel. These buildings are of white marble from the quarries near Sing Sing.

The hospital is appointed to accommodate 125 patients, though during the Rebellion the lists ran up as high as 450, but many of these were billeted in a wooden annex, which was torn down after hostilities ceased. The general conveniences and appurtenances of the hospital, and the system of heating and ventilation, are as complete as it is possible to arrange. The same machinery that drives heated air throughout the buildings during winter fans the wards and rooms and corridors with a cooling breeze in summer.

Connected with the grounds is a naval cemetery, where many officers and members of their families have been buried, as well as sailors and marines. Up to 1880 there had been registered 1134 interments.

The residence of the medical officer in charge is a comfortable suburban villa, built half a century ago, and sequestered by an intersecting wall. The more modern and conspicuous dwelling near the hospital was erected during the war for the director of the laboratory. Besides these are the usual and necessary lodges and houses for employés, conservatory, engine-house, sheds, barns, stables, etc.

Medical Inspector Delavan Bloodgood is in charge of the hospital, and Medical Director Samuel F. Coues of the laboratory.—*Delavan Bloodgood, Medical Inspector U.S.N.*

Naval Hospital, Chelsea, Mass., is beautifully situated on the left bank of the Mystic River. It furnishes accommodations for all the sick or wounded officers, seamen, and marines of the navy at Boston, Portsmouth, N. H., and New London, Conn., and for all invalids from our naval vessels on foreign stations who may come into the port of Boston. The land occupied by the hospital was purchased from Dr. Aaron Dexter, of Boston, on the 22d of September, 1823, by a commission composed of the Secretary of the Navy, the Secretary of the Treasury, and the Secretary of War. There were originally 115 acres in the tract, for which the government paid $18,000; there now remains about 75 acres, the remainder having been transferred to the Ordnance Department of the navy, and to the Marine Hospital Service. The hospital building is 149 feet by 71 feet, and was completed January 7, 1836; a wing was added in 1865. It is substantially built of granite, and is capable of accommodating 100 sick men comfortably. It has three floors beside the cellar and the attic, and has a pyramidal roof. On the first or ground floor are the entrance-hall, the dispensary, kitchen, and offices. The second story contains the wards that are usually occupied by the sick. The hospital fronts the river, and is on the southern exposure of the hill. There is a good supply of sunlight, the sun shining into all the windows at some period of the day. There are westerly breezes from the river, and the hospital is perfectly protected by the hill from the northeast storms, which prevail for six months of the year, and are very penetrating. The ventilation of the hospital is by flues in the partition-walls, which are continued four feet above the roof. The water is supplied from the Mystic reservoir, and is abundant in quantity and very good in quality. The particular merit of this hospital is that it is the only naval hospital on the entire Atlantic coast that is absolutely free from malarial poison. Patients suffering from this disease have been sent here from all the naval hospitals south of Boston, and often recover. Most of the cruising of our naval vessels is within the tropics, and

nearly all cases of sickness are more or less complicated by malarial poison, so that this hospital is better situated for treating the sick of the navy than any other that we have.—*Wm. T. Hord, Medical Director U.S.N.*

Naval Hospital, Mare Island, Cal. *Topography.*—This hospital comprises an area of about 27 acres, situated near the southeastern extremity of Mare Island, and about 1 mile from the navy-yard, with which it is connected by a smooth roadway and a planked walk. It lies upon the eastern slope of a series of curving, somewhat elevated hills, which incline gently to the straits, an arm of San Pablo Bay, separating the island from the mainland.

The soil is a thin, dark loam, with underlying clay and a bedrock of granite. Midway upon the hill-side, the ground has been leveled for the site of the hospital building. Above this is a young park of eucalyptus-trees, while the remainder of the grounds is covered with a variety of trees, chiefly eucalyptus and acacia, and ornamental shrubbery, all laid out into roadways, walks, and garden-plots, where flowers of the temperate and subtropical zones are grown in profusion. Here and there a fountain throws a jet or a spray from the centre of a fish-pond or a rockery.

The view from the hospital affords a pleasing variety. To the left is the navy-yard, with the town of Vallejo opposite; in the middle distance lie the straits, with a cultivated, rolling plain beyond them, dotted with residences, while a chain of mountains fills in the background and the right, as we look eastward from the hospital front.

Buildings.—The hospital building was erected in 1869–70, under the supervision of Medical Director (then Surgeon) J. M. Browne, U.S.N., and was opened for the reception of patients in February, 1871.

Its length is 256½ feet, height 3½ stories, including the basement, and the shape a rectangular parallelogram, the regularity of the outline being broken by jutting portions.

The structure is brick, made from clay obtained near the site of the hospital. It is strengthened by perpendicular iron rods anchored in the walls and crossing five lines of similar rods, which encircle the building in a horizontal direction.

The building consists of a central portion and two wings. The latter are provided with verandas for the first and second stories, which extend their entire length, and are easily accessible from the wards. In the central portion is the main entrance, protected by a portico, at each end of which a jutting tower rises several feet above the Mansard roof, and supports an iron tank from which water is distributed to various parts of the house.

In the basement are the general mess-room, kitchen, smoking-room, store-rooms, chambers, and mess-room for all attendants, bakery, laundry, with stationary tubs and drying coils, and the fire-room, with donkey-engine for filling the tower-tanks and flushing the sewers.

On the first floor are the reception-room, general and private offices, quarters and mess-room for the attending medical officers, and the dispensary on either side of a central corridor, near the extremities of which are a nurse's room and a diet-kitchen. At each end of this corridor is a ward for patients of the following dimensions, viz.: length 68 feet 5 inches, width 24 feet, height 14 feet 9 inches. It is lighted by 13 windows, 5 on each side and 3 at the farther end, each 9 feet 2 inches by 2 feet 11 inches, heated by an open grate at either end of the ward, and ventilated satisfactorily by the windows and 8 ventilating flues. It is provided with water-closets, stationary marble wash-basins, and a bath-room with hot and cold water. The capacity is 20 beds, and when all are occupied each patient has about 82 square feet of floor-space.

On the second floor are the two remaining wards, similar in all respects to those below. They also are connected by a corridor, opening upon which are apartments for invalid officers and the executive surgeon. A nurse's room and a diet-kitchen are near each ward.

On the attic floor are additional chambers for attendants, the *post-mortem* room, a prison for refractory patients, and the bag-room for the patients' hammocks.

There are two water-closets and a bath-room on each floor besides those in the wards. A linen shute near each ward and an elevator extend from the attic to the basement.

Electric call-bells are attached to the officers' rooms, and a telephone connects the hospital with the navy-yard.

The building is lighted at night by gas manufactured on the premises, heated throughout by open grates, and provided with a good sewerage, the conformation of the grounds rendering efficient drainage easy.

The water used in the hospital is rain-water collected by drainage from the neighboring hillsides into a large reservoir, whence it is delivered through iron pipes into two subterranean cisterns near the building having each a capacity of 90,000 gallons.

The ward for patients affected with contagious diseases is situated beyond the hills, and about one-half mile west of the hospital. It is an ordinary frame building, and merits no particular description.

The administration of the hospital consists of a medical director in charge, an executive and two attending surgeons, an apothecary, purveyor, two nurses, and general subordinates.

Climatology.—In the absence of complete meteorological data it must suffice to say that the mean annual temperature of Mare Island is about 60°, the extremes 35° and 86° F. The latter are the minimum and maximum *recorded* during the 10 years from 1869 to 1879. The rain-fall varies from 16 to 38 inches, approximately, and occurs almost wholly between November and May in a succession of April showers. Snow rarely falls, and never lies upon the ground longer than a few minutes. Ice, and even heavy frost, is exceptional, so that flowers may be seen blooming in the open air throughout the year, and but little fire is commonly needed even in midwinter.

The prevailing winds are westerly, and during the summer months are steady, fresh, and sometimes chill. The nights are always cool.

As a sanitarium, this hospital is probably unsurpassed by any similar institution in the country. The mildness and equability of the climate, and the picturesque surroundings, invite the invalid to an out-of-door life with its attend-

ant sunshine, fresh air, and gentle exercise, and while conveniently near Vallejo and San Francisco for the purchase of supplies, the comparative isolation of the hospital affords the quiet and repose of country life. It is the sanitary resort of patients from all the United States men-of-war cruising on the Pacific, and although they come from the coast of Mexico, Central and South America, Japan, and China, yet all find the climate grateful and conducive to restoration of health.—*J. M. Browne, Medical Director U.S.N.*

Naval Institute. The United States Naval Institute was organized at Annapolis, in the fall of 1873. The object of the institute is to provide a medium for the circulation of knowledge on subjects of interest to the profession, and to bring the subjects under discussion.

As the officers of the navy are scattered all over the globe, it is impossible to get any very great number of them together in one locality; for this reason the society is divided into branches, each branch holding its own meetings and electing its own local officers. The headquarters are at Annapolis.

The papers read in the branches, and the discussions which arise from them, are forwarded to headquarters, where, with those from that place, they are published for general circulation among the members. All officers holding positions under the Navy Department are eligible to membership. Provision is also made to admit, as associate and honorary members, such persons out of the profession as may desire to become members, or whom it may be thought desirable to associate with the undertaking.

Any person eligible to membership has only to send in his name to the secretary of the institute, who is stationed at the Naval Academy, Annapolis, in order to become a member.

The published proceedings form a very interesting and instructive collection of service literature. As we have stated, they are sent to all members from the date of admission, and may be purchased by any person at a slight advance on the cost price.

The institute has met with great success in the service, and the membership is becoming larger every year. There is hardly a quarter of the globe where, during one evening in each month, some of the members may not be found assembled for discussion.

Each year the institute offers a gold medal and a life-membership as a prize for the best essay on some subject selected and published during the preceding year.

The general officers of the institute are a president, a secretary, a corresponding secretary, and a treasurer. Each branch has a vice-president and a corresponding secretary, who acts as local secretary and treasurer.

The dues are very small, $3 for a member, and $1 for an associate, and are payable annually on the first day of January. The admission fee is only nominal. As yet the government has done but very little to foster this undertaking, but it is hoped that before long it may be recognized as one of the institutions of the Navy Department, as is the case with similar societies under foreign governments.—*Theo. B. M. Mason, Lieutenant U.S.N.*

Naval Lyceum. The United States Naval Lyceum was organized at the New York Navy-Yard, November 28, 1833, by the officers of the navy and marine corps stationed at the yard or living in its vicinity. Master-Commandant M. C. Perry presided at the first meeting, and Commodore Chas. G. Ridgely, then commandant of the yard, was the first president. In May, 1835, the lyceum was incorporated by the Legislature of New York, and authorized to hold property valued at $25,000.

The constitution of the society in its preamble declares that it was formed "in order to promote the diffusion of useful knowledge, to foster a spirit of harmony and a community of interests in the service, and to cement the links which unite us as professional brethren." To carry out the objects mentioned a library and reading-room were formed, a museum was established, and papers on naval ordnance, construction, and equipment, etc., were read and discussed, the lyceum being thus the forerunner by forty years of the United States Naval Institute.

During the years 1836 and 1837 a bi-monthly called *The Naval Magazine* was published by the lyceum, with Chaplain C. S. Stewart as editor; it contained articles on professional subjects, narratives of cruises, and general naval intelligence. J. Fenimore Cooper, Commander A. S. Mackenzie, Wm. C. Redfield, Esq., Chaplain Walter C. Colton, and Dr. Usher Parsons were among the contributors to what it is believed was the only purely naval periodical ever issued in the United States. The lyceum was an earnest advocate of the establishment of a naval school and of the increase of the steam navy, and in addition to its magazine published, during its earlier years, various pamphlets on professional subjects. In those days, having a permanent librarian, the lyceum took charge of letters directed to its care and forwarded them to the various foreign stations. The society flourished with a very large membership for over 25 years; during the war of the Rebellion, however, it dwindled in size, and its organization was suspended for some time; it was reorganized in 1871, and now has over a hundred members.

The museum, library, and reading-room occupy the upper floor of the building in the navy-yard, which derives its name from the society, but which is also used for the offices of the commandant, captain, and paymaster of the yard, and their assistants.

The museum grew very rapidly at first, and received many donations from citizens as well as more numerous contributions from officers; it contains a fair collection of coins, minerals, models of vessels, and general curiosities, a fine lot of autographs, and a valuable set of portraits in oil of the earlier Presidents of the United States and of distinguished naval officers, including Bainbridge, Chauncey, Decatur, Hull, Nicholson, Shaw, and Rogers. It is one of the chief objects of interest in the yard, and is daily visited by numerous parties from all sections of the United States, and even from other countries; in 1879 the number of visitors was over 10,000.

The library, like the museum, received many valuable contributions during the earlier years of the society from citizens, as much as $500 being given at one time by some marine insurance companies for the purchase of books; of late years many books have been donated by the various bureaus of the Navy and War Depart-

ments, the naval observatory and the coast survey. It now has 5000 volumes, many of them of great value, and not easily replaced; this is particularly the case with the volumes pertaining to military and naval history, biography, and science; there is also a valuable collection relating to voyages and travels. Nearly all the professional journals of this country and some of the best European ones are taken, as well as several of the literary periodicals of the day.

The officers of the society consist of a president, vice-president, secretary, treasurer, librarian, auditor, and library committee. The commandant of the yard is *ex officio* the president. The entrance fee is $3, and the annual dues $1; the regular meetings occur monthly, on officers' pay-day, at 11 A.M. All cadet midshipmen and cadet engineers are invited to avail themselves of the benefits of the institution by the tender on the part of the society of access to its rooms, cabinet, and library; and the same privilege is extended to all the officers of vessels temporarily at the New York Navy-Yard. Contributions of books and pamphlets and curiosities are solicited from old members and friends of the society, particularly of books relating to naval affairs and maritime explorations.—*F. Hanford, Lieutenant U.S.N.*

Naval Officer. An officer in the naval service. A custom-house officer. See CUSTOMS.

Naval Songs. Lyrical poetry is the most ancient and enduring method of instructing the young, and of keeping alive the history and traditions of a nation.

With every intelligent people there is a natural curiosity to know something of past events, and of those who have rendered themselves illustrious. When, therefore, books were scarce and libraries unknown, metrical composition became a necessity. Those who could compose or recite high themes in pleasing numbers were held in great esteem; not simply that their verses delighted the ear, but because they instructed the heart and mind, and stimulated the memory to retain all that was good and noble and worthy of emulation in the past. These verses were not only repeated at high festivals and great banquets, but beneath the vine and fig-tree, and in the seclusion of home; the earliest lays that caught the infant ear told of the glories of other days. Thus was handed down from father to son the history of a race.

Of all the works of man, Song is the most enduring. The great Assyrian empire has crumbled into dust, Nineveh and Babylon, Tadmor and Baalbek have suffered Time's remorseless doom; and yet the Song of Moses, telling how the Lord delivered his people out of the hands of Pharaoh's hosts, is as fresh to-day as when Miriam and all the daughters of Israel raised their dark Jewish eyes to heaven and to the sounding timbrels sang praises to their fathers' God.

The Sacred Songs of David have carried hope and comfort to the hearts of thousands upon thousands; and the "Song of Songs," so old that its authorship is unknown, has told, and will for all ages continue to tell, of the ineffable pleasures of pure and faithful love.

The wrath of Achilles, the devotion of Patroclus, the noble actions of Hector, the love of Andromache, all embalmed in immortal verse, have served to incite countless generations of youths to deeds of daring. From the days when the Argonauts rowed in unison to the charmed melodies of Orpheus, the sailors of ancient Greece ceased not to enliven with song the labors of the oar. They chanted hymns on going into battle, and sang pæans in honor of victory.

Cato, the Censor, in speaking of the ballad poetry of ancient Rome,—unhappily lost,—said that many ages before his time there were ballads in praise of illustrious men, which it was the fashion for the guests, at banquets, to sing in turn while the piper played.

"Where," Cicero mournfully asks, "are those old verses now?" Valerius Maximus observes that the ancient Roman ballads were probably of more benefit to the young than all the lectures of the Athenian schools, and that to the influence of the national poetry were to be ascribed the virtues of such men as Camillus and Fabricius. This observation certainly lends weight to the oft-quoted remark of Andrew Fletcher, of Saltoun, who said, "I knew a very wise man that believed that, if a man were permitted to make all the ballads, he need not care who should make the laws of a nation."

We have the authority of Tacitus for saying that songs were the only memorials of the past which the ancient Germans possessed. The brave actions of the ancient Gauls were commemorated by their bards, and the ancient Skalds sang in Runic rhymes the deeds of the sons of the fjords.

The exploits of Athelstane were sung by the Anglo-Saxons; those of Canute by the Danes. The chants of the Welsh harpers preserved through ages of darkness a memory of Arthur, and the long struggle of the Servians against the Ottoman power was recorded in lays full of martial spirit.

The sea victories achieved by the heroes of modern times have not wanted poets to celebrate them in verse. The "Battle of the Baltic," by Thomas Campbell, will continue to tell of "Nelson and the North" long after St. Paul's shall have fallen into ruin. But the poet *par excellence* of the English navy was Dibdin. What was said of the effect of the ballads of ancient Rome in forming the character of the Roman youths is certainly true of the sea-songs of Charles Dibdin. He not only sang of England's naval heroes and their victories, but of the sailor and the sailor's life; of his loyalty, his courage, and his devotion. Most of Dibdin's sea-songs, indeed, are pervaded by a wholesome moral tone and an elevation of principle that could not but exert the happiest influence on the young.

"Poor Jack," quoting the chaplain, says:

> . . . "let storms e'er so oft
> Take the topsails of sailors aback,
> There's a sweet little cherub that sits up aloft,
> To keep watch for the life of poor Jack."

What more touching tribute to the memory of a departed shipmate than the lines to poor Tom Bowling? He was

> "The darling of our crew;
> No more he'll hear the tempest howling,
> For death has broached him to.
> His form was of the manliest beauty,
> His heart was kind and soft;
> Faithful below he did his duty,
> But now he's gone aloft."

The virtues of another tar are told of Tom Tackle, who

> "Was noble, was true to his word;
> If merit brought titles, Tom might be a lord;
> How gayly his bark through life's ocean would sail!
> Truth furnished the rigging and Honor the gale."

And so of Tom Transom, "a seaman sound to the backbone," and scores of others.

The great influence of Dibdin's songs may be estimated from the fact that in 1803 the British government engaged him to write a series of songs, "*to keep alive the national feelings against the French.*" His biographer adds, "His engagement ceased with the war *he thus assisted in bringing to a glorious close.*"

While Dibdin's songs of victory were being sung, not only on every forecastle, but in every town and hamlet of England, the infant navy of the United States found itself suddenly confronted by ships fresh from the glories of Trafalgar! When, therefore, the news spread over the country that the "Constitution" had captured the "Guerriere," an English frigate of about the same rating, there was scarcely any bounds to the popular enthusiasm. Songs were composed in honor of the event, and sung at public dinners, public meetings, and in the navy. For years after the close of the war of 1812, such songs as "Constitution and Guerriere," "Decatur and the Navy," "The United States and Macedonian," "The Hornet; or, Victory Number Five," contributed very materially towards keeping up the popularity of the navy. The Revolutionary war gave rise to comparatively few naval songs. One of them, however,—"Paul Jones's Victory,"—was for many years a great favorite in the navy. A memory of the *quasi* war with France is well preserved in "Truxtun's Victory":

> "Come all ye Yankee sailors, with swords and pikes advance,
> 'Tis time to try your courage and humble haughty France;
> The sons of France our seas invade,
> Destroy our commerce and our trade,
> 'Tis time the reck'ning should be paid
> To brave Yankee boys."

The war with Mexico gave rise to very few naval songs,—the late war of the Rebellion to very few.

That our old naval songs have died out is due in no slight degree to the comparatively small proportion of native-born seamen who have manned our ships. Of those who could claim to be Americans, many were interchangeable with the merchant service, so that the recognized body of American men-of-war's-men was extremely limited. Furthermore, there were no means of making good the waste by death, casualties, etc. The old type of sailor, therefore, died out, and with him passed away the songs and traditions of the old navy.

But a new era has opened for the American sailor. The training of boys for the navy will now yield a continuous supply of American men-of-war's-men of the best type. The songs which commemorate our early naval victories, once revived, could not fail to inspire the rising generation of seamen with that spirit of loyalty to their flag and devotion to duty which distinguished those who laid the foundation of our naval renown. (Macaulay's "Lays of Ancient Rome," Aikin's "Origin of Songs," Dibdin's "Universal Songster," London, 1827; "Songs for Sailors," W. C. Bennett; "The Book of Battle Songs and others.")—*S. B. Luce, Captain U.S.N.*

Naval Station, Key West, Fla. The naval station at Key West, Fla., is situated on the western side of the island, and directly on the harbor. It embraces 2¼ acres of land, with an L-shaped wharf. Length of wharf from store-house to water front 225 feet, and breadth 31 feet; length of water front 250 feet, with a breadth of 41 feet. The wharf contains a double railroad track and a heavy crane. Mean depth of water at low-tide at wharf is 18 feet, running abruptly to 25 feet, so that the largest ships can remain alongside at all times.

At the northern end of the station is the store-house, a heavy brick building of two stories, 184 by 80 feet, the brick-work of which was completed in 1857. The building underwent the necessary improvements at different times until it was finished in 1866, and has been used ever since as a store-house for the different bureaus, and contains offices for the officers of the station. The room at present occupied by the paymaster of the station was the first office of the International Ocean Telegraph Company in Key West.

Connected with the store-house are two cisterns containing 75,000 gallons each, which were constructed in 1862.

The next naval building is the coal-shed, built in 1868 of wood, 150 by 60 feet, capable of containing 2400 tons, and connected with the water front of wharf by a railroad track, but separated from the store-house by the U. S. custom-house, U. S. light-house building, and the lots called the Mallory property.

Next is the foundry, built of brick in 1873, 73 by 43 feet; and very near the foundry, at the southern end of the station, is the machine-shop, built of wood in 1862, 137 by 41 feet.

There are the following smaller buildings: 1 store-house, 25 by 16 feet, of wood; 1 store-house, 23 by 13 feet, of wood; 1 scale-house, 8 by 6 feet, of wood; 1 transit-house, 8 by 6 feet, of wood; 1 carpenter's shop, 23 by 17 feet, of wood. Total value of property, $230,000.

In 1874, on account of anticipated trouble with Spain, the North Atlantic, South Atlantic, and the greater part of the European fleets were ordered to Key West, numbering in all 26 vessels of every description, under the command of Admiral A. L. Case. Commodore F. A. Parker was detailed for special duty as chief-of-staff, to superintend the grand naval drill in accordance with his tactics. Four thousand men were landed on the south beach of the island, and were exercised in skirmish and battalion drill. In May of the same year, the trouble having been amicably settled, the fleets were dispersed to their respective stations, and the North Atlantic Squadron was left in command of Rear-Admiral G. H. Scott. In April, 1875, the fleet left this place on account of yellow fever, and it has never since that time been used as headquarters for the squadron.

List of line- and staff-officers from 1872 to the present time:

Line-officers.—Lieut.-Com. A. N. Mitchell, from 1872 to 1873; Commander A. E. K. Benham, from 1873 to 1874; Commander A. R. Yates, from April, 1874, to June, 1874; Lieut. J. K. Winn, from 1874 to 1875; Lieut. E. B.

Thomas, from December, 1876, to 1879; Lieut.-Com. J. K. Winn, from November, 1879, to the present time.

Paymasters.—Passed Assistant Paymaster Henry Girrard, from 1871 to 1872; Passed Assistant Paymaster F. C. Alley, from 1872 to 1873; Assistant Paymaster F. Clark, temporarily, 1873; Passed Assistant Paymaster F. Bissell, from 1873 to 1874; Paymaster A. J. Clark, from 1874 to 1875; Passed Assistant Paymaster E. Melach, from 1875 to 1877; Passed Assistant Paymaster H. C. Machette, from 1877 to 1879; Assistant Paymaster Wm. W. Galt, from 1879 to the present time. Passed Assistant Paymaster E. Melach was in charge of depot from 1875 to 1876.

Surgeons.—Acting Assistant Surgeon R. J. Perry, from April, 1872, to May, 1876; Acting Assistant Surgeon L. H. Armstrong, from May, 1876, to May, 1878; Acting Assistant Surgeon R. J. Perry, from May, 1878, to June 30, 1879, when he was discharged by the Hon. Secretary of the Navy, in accordance with act of February 15, 1879, to abolish the volunteer navy of the United States.

In February, 1878, by order of the Secretary of the Navy, this was made a station, and no longer included as a part of the Home Squadron.

One beautiful feature is the monument opposite the front entrance of the store-house, at the intersection of Whitehead and Front Streets, on land owned by the city of Key West, which was erected by the Navy Club of Key West in memory of the gallant officers, sailors, and soldiers of the U. S. army, navy, and marine corps who died while on duty on this station from 1861 to 1865.

Until Lieut. Thomas, who rebuilt the wharf and otherwise improved and beautified the station, assumed command, owing to very limited appropriations, very little care had been bestowed upon this monument and its surroundings, but one of his first acts was to have the lot on which it stands surveyed and inclosed in a neat picket-fence, grass-seed sown, and shade-trees planted; and his successor, Lieut.-Com. Winn, has continued to bestow the same solicitous supervision, so that each year it is becoming more beautiful in appearance and creditable to those who had it erected.

The importance of Key West as a naval station has never been overestimated by the government, and as far back as 1824 it was used as a rendezvous by the gallant Commodore Porter when in command of a fleet of gunboats engaged in cruising for pirates on the coast of Cuba and in the West Indies.

During the late civil war the port of Key West was brought prominently into notice by being the headquarters of the Gulf Squadron. It was the only port in the Gulf possessed by the government, until the capture of New Orleans and the evacuation of Pensacola.

Key West has a fine harbor, easy of access, and safe anchorage; 28 feet of water can be carried at all times through the southwest channel.

Naval ships of the class of the "Colorado" and "Niagara" have visited this port often, and have never experienced any difficulty in entering it.

Naval Station, New London, Conn. The New London Naval Station was established by the government in 1868. It is situated on the east bank of the Thames River, and about 6 miles from its entrance to the sound,—containing about 100 acres of land with a mile of shore front. The Thames River has depth for the largest vessels for some miles above the site, within the harbor of New London, reputed to be one of the best harbors on the Atlantic coast. It is about equidistant from New York and Boston, and has a fine, clear entrance to and from the ocean.

The government has made appropriations from time to time for improvements at this site; a wharf 800 feet long, 2 store-houses, and several other buildings have been constructed, and some 25 acres of ground has been graded to a proper level for the purposes of the yard.

Commodore T. A. Hunt was the first commandant; then Commodore R. Werden, who was succeeded by Commodore D. McN. Fairfax. Commodore Edward Simpson is the present commandant of the yard.

No vessels have yet been built at this yard, but it is considered admirably adapted for that purpose, and for the erection of any structures which may be required at a navy-yard, the foundations being solid and plenty of excellent granite close at hand. It was recommended by a board of officers in 1862, of which Rear-Admiral Stringham was president, and it is believed has the unanimous approval of all nautical men.

The "Dictator," "Florida," and other vessels of large draft have been at its wharf. The "Minnesota," the largest of the Training Fleet, commanded by Capt. Luce, is stationed there during the winter, with 500 or 600 men and boys in training. The site was a gift from the State of Connecticut to the government for naval purposes, and it has been recommended by the different Secretaries of the Navy as one of the best locations for a national navy-yard, as the Thames River never freezes, and is accessible from the sea at all seasons.

Naval Station, Port Royal, S. C. Port Royal possesses many natural advantages, one of the greatest being its salubrity of climate, which is much warmer than many places situated far south of it. The depth of water on the bar at the entrance to the harbor is 20 feet at dead low-water, with a mean rise and fall of tide of between 6 and 7 feet, and as it is from 200 to 300 miles nearer to all the Southern and Western shipping centres than New York, this fact of itself would seem to insure its eventually becoming a place of importance; but, in addition to this fact, it is the only place on our whole coast between Norfolk and Key West which has this great depth of water in the harbor, and at the same time is large enough to afford shelter to our largest ships of war, and where a naval station possessing the requirements for refitting and replenishing our squadrons could be established. But before establishing such a station it would be necessary to select the site beyond the reach of an enemy's long-range guns, and to have the approaches defended by fortifications which an enemy would not attempt to pass.

Port Royal was first occupied by Rear-Admiral Dupont in 1861, and continued an important naval station until 1865, since which time its importance has been decreasing until the present time, when, although the vessels of the North Atlantic Squadron may obtain supplies

of nearly every description, there are no facilities for repairs.

Although no ships have ever been built, the government had large shops established here during our late war, where repairs of nearly every description could be effected. The town of Port Royal is gradually increasing in mercantile importance, and capitalists are realizing the fact of its many natural advantages, and recently large and extensive docks and a large steam cotton-compress have been constructed, and a grain-elevator and cotton-factory are now under contemplation.

The harbor of Port Royal was the rendezvous for our ironclad fleet until the spring of 1877, and after its removal the "New Hampshire" was converted into a training-ship for apprentices; but owing to her being so heavily sparred as to render anything like seamanship evolutions impossible, the apprentices, 60 in number, were, in June, 1879, transferred to the other training-ships, since which time she has been used as a store- and receiving-ship, the only other permanent vessel being the "Pawnee," which is used as a store-ship for coal.

The station has generally been commanded by a flag-officer, the first being Commodore I. M. B. Clitz, who was relieved, in the spring of 1877, by Commodore A. K. Hughes, who remained in command until August, 1878, when he was succeeded by Commodore George M. Ranson, who was relieved by Commodore Thomas Pattison, in January, 1879, and he was succeeded, in August, 1880, by Capt. James E. Jouett.—*W. E. Whitfield, Ensign U.S.N.*

Naval Stores. Ship's stores.

Naval Tactics (Greek *τακτικος*, capable of being arranged, as in the order of battle). Tactics may be defined as the art of military movements. Naval tactics comprehend those evolutions which are designed to bring the ships of a fleet or squadron into a determined order, or to change them from one order to another. They have for their object the conducting, according to certain rules, of a naval force in and out of port; anchoring and getting it under way; navigating it on the high seas; the formation of the line of battle; the pursuit of any enemy; the protection of a convoy; retreating from a superior force; and, when the several ships of the command have been dispersed by battle, by the violence of the elements, or other cause, their restoration to any one of the recognized orders. These various movements, and the evolutions necessary to effect them, are to be found in the Signal Book (see SIGNALS), each evolution being accompanied by a diagram showing the movement of each ship of the command.

On paper they appear so simple that the possibility of mistakes seems remote indeed; and yet we have the melancholy examples of the "Vanguard," the "Grosser Kürfurst," a collision between two ironclads in the French navy, and the sinking of a Russian man-of-war while engaged in tactical evolutions, to say nothing of numerous collisions of lesser note, to show that nothing but the school of actual and continued practice will ever enable officers to handle their ships so skillfully as to insure the invariable success of fleet evolutions. If the weather were always pleasant and the sea smooth; if signals could always be read with certainty and correctly interpreted; if the several ships of the command were all homogeneous; if they all maintained the same speed, and under similar circumstances described equal arcs of evolution, the manœuvring of a fleet would be comparatively easy. But these conditions are rarely, if ever, fulfilled. Scarcely any two ships will be found possessed of the same facility of turning, or able to maintain the same speed under varying circumstances. Hence the following definitions:

The co-efficient of speed is the ratio between the number of revolutions per minute of the engines of a given ship and those of the flag-ship, when the speed of both is the same.

The co-efficients of helm are the ratios under various conditions of speed between the angles of a given ship's helm and those of a flag-ship's helm, when both are describing the same circle.

Every ship of a command should know its own co-efficient of speed and its own co-efficients of helm for different rates of steaming. Every ship should know, also, the mast-head angles of every other ship of the command, both for open and for close orders: 2 cable's lengths, or 240 fathoms, and 1 cable's length, respectively. This is the only means by which the proper distances may be observed. Distances are reckoned from mainmast to mainmast.

An assemblage of vessels of war takes the name of fleet when it consists of 12 or more ships of the line, or vessels of equal military value; dispatch-boats, transports, etc., are not considered.

A naval force of less than 12 line-of-battle ships, or vessels of equal military value, takes the name of squadron or division, according to its numerical strength.

A fleet is separated into three divisions of one, two, or three squadrons each, each squadron comprising not less than four vessels.

The command is distributed as follows: the commander-in-chief commands the fleet, the second in command the van division, the third in command the rear division, the fourth in command the centre.

The smaller and lighter vessels constitute the light squadron; the transports, the convoy.

The reserve division should be about one-fourth the strength of the whole fleet, and be drawn equally from the van, centre, and rear divisions.

There are but three formations, any one of which may form an order of battle, viz.:

1. *The line* (Fig. 1), in which the ships are ranged on a line at right angles to the course; in natural order when the van is on the right, inverse order when it is on the left.

2. *The column* (Fig. 2). Single column is when each ship follows in the wake of the leading ship; double column when the two leading ships are on a line at right angles to the course, and at a prescribed distance from each other, and the two columns are parallel. The column is in natural order when the van is leading, in inverse order when the rear squadron or division is leading.

3. *The echelon* (Fig. 3), when the ships of the command steering the same course are ranged on a line of bearing four points from the course. *Double echelon* is when there are two such lines of bearing, the two wings forming a right angle, as in Fig. 4. The echelon is in natural order when the van is on the right, in inverse order when it is on the left.

FIG. 6.
FIG. 7.
FIG. 8.
FIG. 9.
FIG. 10.
FIG. 11.
FIG. 12.
FIG. 13.

When the ships steer in direct double echelon, as in Fig. 4, they are said to be in the *offensive order*, or *order of chase*. When reversed, as in Fig. 5, the order is termed the *defensive*, the *order of retreat*, or the *order of convoy*.

The foregoing constitute the simple orders. Compound orders are those wherein the squadrons or divisions, considered as units and in the same formation, are ranged on one of the simple orders, thus:

Fig. 6, a column of squadrons or column of fours, in natural order, heading north.

Fig. 7, columns of vessels abreast by squadrons, in natural order, heading north.

Fig. 8, in echelon of squadrons, natural order, heading north.

Taking now the two simple orders, *line* and *column*, and regarding the ship as a company of infantry and the squadron as a battalion—or, better still, the ship as a section of artillery and the squadron as a battery—we have only to apply the rules of military tactics to enable us to form the command in any desired order. The fleet being in line, for example, heading north (Fig. 1), let it be required to form column of squadrons to the right. The commander-in-chief signals, *Fleet, by squadrons, wheel to east.* The movement is then effected as in Fig. 9. The column may be brought into line again by a left oblique movement of the centre and rear, or by Fig. 6. From this it would appear that Admiral George Monk, whilom chief of artillery under Cromwell, was simply wiser than his generation when he moved the mirth of the sailors by calling out, "Wheel to the right!" when he wanted to tack ship.

The foregoing is a summary of what is called *elementary tactics*, that branch of the art of war which immediately precedes *grand tactics*, or the tactics of battles, *strategy* being the highest branch, for which reason it has been called the science of generals.

In what order soever the fleet may be formed, whether at anchor or under way, the ultimate object of elementary tactics is the formation, in the most expeditious manner possible, for battle; the two first branches above named, therefore, merge in

The order of battle. This, in the sail-period, when ships carried their batteries in broadside only, and depended on the wind for the motive-power, was the close-hauled line ahead. The tactical order of battle of the steam-period is the column (Fig. 2) for vessels carrying their batteries in broadside, and the line (Fig. 1) for vessels whose offensive powers lie in the ram and "end-on" fire.

But the single line, by its liability to be broken or doubled up, is considered the weakest of all recognized orders of battle. The ablest tacticians of both ancient and modern times have therefore doubled the line (Figs. 10 and 11), and added a reserve to strengthen any particular point at will.

With a view to the formation of a strong line of battle, as well as facility of manœuvring, and a system of mutual support, the French have introduced into their system of tactics the *peloton*, or groups of three vessels acting together. Thus, in Fig. 12 we have the column of *pelotons*, and in Fig. 13 the *pelotons* in line.

The expression *order of battle* is, in fact, an arbitrary term applicable to any disposition of a fleet for battle which the commander-in-chief may adopt to suit the occasion. Conon, Phormio, Alcibiades, Themistocles, the Athenian fleet at Arginusæ, the Roman fleet at Ecnomus, Cæsar at Alexandria, Agrippa and Antony at Actium, afford some admirable illustrations of orders of battle of the ram-period,—the period, in fact, to which we have returned.

Of the naval powers of modern times the French have paid most attention to naval tactics, though in actual warfare they were charged, during the sail-period, with a somewhat too close adhesion to rules.

De Grasse, after the action of 12th of April, 1782, justified himself against the charges brought against him by the other flag-officers of his fleet by pleading his compliance with the *Ordonnance du Roy*, which specified a particular line of conduct under similar circumstances. Rodney's fleet being to leeward, was enabled by a shift of wind during the action to lead through the enemy's line. The *Ordonnance* prescribed that the French fleet was then to tack together. De Grasse made the signal for that purpose, which was not obeyed by M. de Vandreuil, the second in command, and his squadron, under the pretense that no man in his senses would have ordered such a manœuvre under an enemy's fire. An eminent French writer notices the same defect, and ridicules what he terms the pious regard of his countrymen for the "sacred order of the line of battle" to which the combined fleets were sacrificed at Trafalgar.

While Nelson advanced in two close columns to overwhelm the centre of this "sacred line" the two wings remained immovable; they were "in line," he says, and that was enough; and in this position they looked on "*avec une effrayante impassibilité*" until the centre was destroyed; then, and not till then, forgetting all respect for the "sacred order of the line," they thought, not of seeking to remedy any part of the evil, but of making their escape. (See "Fleet Tactics Under Steam," by Commodore F. A. Parker, U.S.N.)—*S. B. Luce, Captain U.S.N.*

Naval Training System. In 1835, Mr. John Goin, of New York, first suggested the idea of opening nautical schools for boys wishing to follow the sea as a livelihood. There was such a large proportion of foreign seamen in both the national and mercantile marines, that the training of boys for the sea was thought to be the only means of manning our fleets with native-born Americans. The press advocated Mr. Goin's proposition with much zeal. When the subject was brought to the attention of Congress, an act was passed (approved March 2, 1837) making it lawful to enlist boys for the navy (with the consent of their parents or guardians) not under 13, nor over 18 years of age, to serve until 21. Under this act enlistments commenced at once and proceeded with vigor, the boys being sent to the "Hudson," frigate, then a receiving-ship at New York, to the line-of-battle ships "North Carolina" and "Columbus," and to the "Java," frigate, the receiving-ship at Norfolk. The Secretary of the Navy in his instructions to the commanders of ships having boys on board, directed that they (the apprentices) were to be thoroughly instructed, so as to best qualify them to perform the duties of seamen and petty officers. In his annual report of November 30, 1839, the Secretary

says, "Should this system of apprenticeship be carried to the extent of which it is susceptible, I look forward to it as a source of great and lasting benefit to the navy. There is every reasonable prospect of its becoming a nursery for the supply of petty officers, one of the most important constituents in the service; nor can I doubt that it may be made the means of supplying a large number of capable, intelligent seamen, more strongly attached to their country by the benefits she has conferred on them." But the idea got abroad that the apprentice-boys were in time to be advanced to the grade of midshipmen, and thus enter the line of promotion to the highest rank. Many boys of excellent family enlisted under this impression. By dint of political influence two or three of the enlisted boys were appointed midshipmen. This had the effect of rendering the less fortunate ones discontented with the service. This, with the discovery of the true nature of the apprentice system as set forth in the letter of the Secretary of the Navy, caused a general clamoring for discharges, and as these applications were backed up in most cases by strong political influence, they were generally successful. Failing to obtain their discharge, many deserted. The apprentice system of 1837 lacked organized effort, cohesion, stability,—in short, every element of permanency. After lingering a few years it finally died out.

In 1863 a report was made to the Navy Department on the training system of the English navy, with a recommendation that a similar system be adopted for the U. S. navy. The recommendation was so favorably received that the Department authorized (circular of March 27, 1874) the resuming of the enlistment of boys under the provisions of the act of March 2, 1837. The "Sabine," frigate, was selected as the school-ship, and in due course of time the "Saratoga" and "Portsmouth" were added. For a time everything proceeded so well as to justify the most sanguine hopes. Unfortunately, the Secretary of the Navy, in his annual report for 1864, gave expression to the following views in relation to the boys on board the "Sabine": "Commencing as apprentices on the school-ship, it would be well to open to the sailor-boy the way to promotion by giving him an opportunity, if he shall deserve it, of entering the Naval Academy. From among the apprentices on the school-ship a selection of one-half of the midshipmen annually appointed might be made with great advantage to the service and the country. . . . It would popularize the navy, and open to those who may have enlisted the highest positions and honors of the service." In accordance with these views a limited number of apprentice-boys were sent every year to the Naval Academy to be examined for admission. There followed naturally a repetition of the experiment of 1837. Many boys of our best families, having failed to secure appointments to the Naval Academy in the usual way, had enlisted for the sole purpose of gaining admission into that institution. Failing in their object, and having no longer a motive for remaining in the service, some obtained their discharge, others deserted. Among the several school-ships there seems to have been no concert of action; there was no controlling power, no head,—in short, no system. The experiment of 1864 lingered, like its predecessor, for a few short years, and, like it, died out.

Under date of November 12, 1872, the subject of training-ships was again brought to the notice of the Navy Department, but failed for the time to gain the attention its importance deserved. In the meanwhile the Legislature of the State of New York passed an act to establish a nautical school "for the education and training of pupils in the science and practice of navigation." To aid this school, and to encourage other States to follow the example of New York, Congress passed the "Marine School" bill (approved June 20, 1874), authorizing the Secretary of the Navy to furnish a suitable vessel of the navy to any nautical school established at the ports of New York, Boston, Philadelphia, Baltimore, Norfolk, or San Francisco. Under the provisions of this act the Navy Department turned over to the city of New York for the use of her nautical school the old sailing sloop-of-war "St. Mary's," to be used as a school-ship. Shortly after the "Jamestown" was loaned to the city of San Francisco for the same purpose. The latter, however, was soon given up. Stimulated, perhaps, by the example of New York, the Navy Department, under date of April 8, 1875, issued a circular stating that a limited number of boys between the ages of 16 and 17 years would be enlisted under the provisions of the act of Congress of March 2, 1837. The steam-frigate "Minnesota," then flying the flag of Vice-Admiral S. C. Rowan, at New York, was designated as the school-ship. As yet the number of boys enlisted had to be taken from the 7500 men allowed the navy by Congress. As this drain on the complement of men hampered the operations of the navy, an act was passed (approved May 12, 1879) authorizing the enlistment of 750 boys over and above the complement of 7500 seamen, and reducing the age of admission from 16 to 15 years. The Navy Department thereupon issued the following:

"*Circular relating to the Enlistment of Boys in the U. S. Naval Service.*

"NAVY DEPARTMENT, WASHINGTON, May 31, 1879.

"The circular of April 8, 1875, relating to the enlistment of boys in the U. S. naval service, is hereby rescinded, and the following substituted, in accordance with the amendments to the Revised Statutes of the United States, approved May 12, 1879, to wit:

"'SECTION 1418. Boys between the ages of fifteen and eighteen years may be enlisted to serve in the navy until they shall arrive at the age of twenty-one years, etc., etc.'

"'SECTION 1419. Minors between the ages of fifteen and eighteen years shall not be enlisted for the naval service without the consent of their parents or guardians.'

"'SECTION 1420. No minor *under the age of fifteen years*, no insane or intoxicated person, and no deserter from the naval or military service of the United States shall be enlisted in the naval service.'

"These boys will be sent on board of suitable vessels, to be trained for the naval service, under the following regulations:

"Every boy previous to being enlisted must satisfy the Examining Board of Officers—

"That he is of robust frame, intelligent, of perfectly sound and healthy constitution, free from any physical defects or malformation, and not subject to fits.

"That he is able to read and write.

"In special cases where the boy shows a general intelligence, and is otherwise qualified, the Examining Board, if they think fit, may enlist him, notwithstanding his knowledge of reading and writing is imperfect.

"That his height and measure are sufficient, being as follows:

Age.	Height.	Weight.	Chest Measurement—breathing naturally.
Fifteen years	4 feet 11 inches.	85 pounds.	27½ inches.
Sixteen "	5 " 1 inch.	90 "	28 "
Seventeen "	5 " 2 inches.	100 "	29 "
Eighteen "	5 " 3 "	110 "	30 "

"The education of the boys will comprise the elements of an ordinary English education, alternating with practical seamanship and other professional occupations designed to prepare them for *sailors* in the navy.

"The prime object is to place in the naval service, with the consent of their parents, such good and deserving boys as will elevate its standard, and make the navy more reliable as an arm of the national defense. Boys who have been convicted of crime cannot, therefore, be received, as it is not advisable that they should become the associates of the better class.

"The boys will be enlisted as third-class boys, at the rate of $9.50 per month and one ration. While serving on the training-ships, they may, if deserving, be promoted to the rating of second- and first-class boys, at the pay of $10.50 and $11.50 per month, respectively, and on cruising-vessels will be entitled to higher ratings, at the discretion of their commanding officers, as a reward of proficiency and good conduct."

At the present date (October 19, 1880) the training-ships "Minnesota," "Constitution," "Saratoga," and "Portsmouth," having on board a total of 715 boys, have been assembled at Hampton Roads for the purpose of being inspected by the Secretary of the Navy; after which they will be sent to different ports to resume enlistments.

The present system has been in operation about five years; just about the lifetime of the experiments of 1837 and 1864. It is yet to be seen whether it will meet with the fate of its predecessors, or justify the hope expressed by Mr. Secretary Paulding in 1839, "that it will be a great and lasting benefit to the navy."—*S. B. Luce, Captain U.S.N.*

Naval Training Systems, Foreign. Schools have been established by most of the more important naval powers of Europe for the training of the men of their fleets, both naval and mercantile,—England, France, Germany, Italy, and Holland having well and completely organized systems for this purpose. The importance of so doing was recognized by these long before it was felt by the government of the United States, which has, until within the last five years, had nothing of the kind which might be called a system.

England, of course, as being pre-eminently a naval and mercantile power, has taken the lead, and has at present, all things considered, the most complete and satisfactory methods of training her sailors. There are at present employed in this duty in the United Kingdom five line-of-battle ships (with brigs as tenders) for the navy, and twenty large ships for the boys intended for the merchant service; two ships of the latter class are for the education of officers only. There are besides these, at several of the great industrial (reformatory) schools, vessels built ashore, from the berth-deck up, which serve for the training of boys who evince a taste for the sea; at Hull is a special free school for the teaching of navigation (established under an old endowment), and finally, at Greenwich is a government school for the sons of seamen, in which are at all times 1000 boys, who are admitted between 10½ and 13 years of age and retained until 15½ years, when they are sent into the navy, if physically fit. All the foregoing establishments are for young boys who have not been to sea; for the further training of seamen in the navy, there are the gunnery and torpedo schools at Portsmouth and Devonport, established on board the "Excellent" and "Cambridge," to each of which ships are attached several other vessels as subsidiary schools.

To take first the navy: the five line-of-battle ships are stationed,—the "St. Vincent" at Portsmouth, the "Boscawen" at Portland, the "Impregnable" and "Implacable" at Devonport, the "Ganges" at Falmouth. In these, at present writing (September, 1880), there are a few over 3000 boys, 2400 of which are the entries of this year. The number entered varies with the demands of the service, and is estimated to be such as will fill the vacancies in the blue-jacket class of the navy. The total number in this class is about 19,000 out of the 30,000 men of the navy, so that the annual waste of the blue-jacket class may be estimated as about 12 per cent.

The boys are received from 15 to 16½ years of age, and undergo a training which lasts through 16 months before being ready for sea-service. When first received he is placed for a week on board a hulk, which is used as a tender to the parent ship; he is there supplied with his clothing and bedding (which is given him free of charge), takes a daily bath, is taught to lash his hammock, stow his clothing, and made to learn many other small details which are necessary to enable him to take care of himself when he goes on board the training-ship.

The training received thereafter is divided between school-work, drill, and practical seamanship in the brig tender. The schooling consists in learning reading and writing from dictation; arithmetic, to include decimals; geography, and religious knowledge. Daily exercises in drills of various kinds take place; boat sailing and pulling, swimming, signaling, etc., are taught, a special class of boys being selected for the last. In April the brigs are ready for sea and the boys are sent on board, about 100 at a time,—as they are prepared,—for a cruise of six weeks or two months, in the vicinity of the parent ship; they are then sent to the gunnery-ship for a six weeks' course in gunnery, after which they are ready for sea-service. At 18 years of age they are rated ordinary seamen, or ordinary

seamen, 2d class, and serve from that time until they are 28, which is the end of the period for which they are bound. The bandsmen and buglers of the English service are also trained in these ships, boys not under 14 years of age being received for this purpose.

The entire system is under one head, the captain of the "Impregnable"; all the other ships are commanded by commanders, who refer all questions relating to the training-service to this officer. A complete system of regulations has been adopted, which is rigidly adhered to, so that every ship is supposed to be doing the same thing at the same time; rigid uniformity is sought, so that the boys turned out from one ship are quite the same as those from either of the others; this has great benefits, as it tends to make a perfectly homogeneous mass of the seamen of the fleet.

The ship's writers, ship's steward's boys, schoolmasters, yeomen, etc., of the British fleet, are furnished from the Greenwich Hospital School, these being specially selected from the mass of boys, and specially trained for their duties; the remainder of the boys are sent, on arriving at the age of 15½, to the training-ships, where they take a front rank on account of their previous excellent training. The school has a sloop-of-war built in its grounds from the berth-deck up, on which the boys get their seamanship training. They also have excellent working models in the school-rooms. The education given at this school is excellent throughout, making it in many respects a model school. It is on the half-time system, in which half the time is given to the learning of trades, those being taught which go to make the establishment as self-supporting as possible, such as mattress-making, tailoring, shoe-making, etc.

The course of those intended for schoolmasters covers a period of six years after they are selected for such training. While undergoing this course, which is divided into three periods of two years each, they are termed pupil teachers. The first period is passed at Greenwich, the second on board the training-ships, and the third again at Greenwich. During all these years their time is largely taken up with teaching, though a fixed and very difficult course of study is laid down for themselves. The result is that the British navy is supplied with one of the most efficient and able body of schoolmasters in the world. Too high praise can scarcely be given them as a class.

To complete the naval training there are, as aıefore stated, the gunnery-ships and their adjuncts, in the training of the older seamen. The course on board these ships includes everything connected with the subjects of practical gunnery and ammunition; it is usually for six months, but many of the men stay three years. There are at this time in the British navy 3000 seamen gunners, and 6000 trained men who have undergone the course in whole or part.

For the mercantile marine there are the "Conway," at Liverpool, and the "Worcester," in the Thames, for officers; the "Indefatigable," at Liverpool, for the sons and orphans of sailors and for destitute boys; the "Warspite," off Woolwich, for poor boys; the "Shaftesbury," off Grays, in the Thames, under the jurisdiction of the London School Board, for boys who desire a sea-training; and the "Exmouth," at the same point, for pauper boys. The remaining vessels, the "Akbar" and "Clarence," in the Mersey, the "Chichester," "Arethusa," and "Cornwall," in the Thames, the "Cumberland," in Row Bay, Scotland, the "Formidable," "Bristol," "Gibraltar," at Belfast, "Havannah," at Cardiff, "Mars," at Dundee, the "Southampton," at Hull, the "Wellesley," in the River Tyne, and the "Mount Edgecumbe," at Devenport, are all ships of the reformatory class, in which are received convicted boys. The great number of such ships militates much against the successful training of boys for the merchant service, as it gives the service itself a bad character to have so many boys of this kind sent into it. The aim should be to raise the tone of the merchant sailor by inducing the better class boys to enter, and there are very few ships in England where boys of this class are received. The training given in all the ships above mentioned is the teaching the duties of the sailor in general. The elements of an English education are likewise given. The most successful appears to be the "Exmouth," in which the drill, discipline, and general appearance of the boys are most admirable. About 600 boys are kept in this ship, which in three years has sent over 200 boys to sea, and 30 into the army,—the latter as musicians.

The "Warspite," supported by voluntary contributions, is under a society which was founded in 1772, and since that time has sent 59,000 boys to sea. All the other ships have been founded within the past 30 years, and most of them are of much later date.

The reformatory (or industrial) school-ships are largely supported by government grants, and all have in addition large sums given by subscribers. The total amount expended on these various ships is about £90,000, the expenditure per boy being about £20, there being about 4000 boys under training.

The "Conway" and "Worcester" are practically nautical colleges, which are supported by the fees of the pupils, 50 guineas a year being charged for the two terms in each year. As neither ship has a tender, the nautical practice in the two years on board is limited. The schooling given includes trigonometry, navigation, nautical astronomy, French, and some steam-engineering. The boys of these two schools have been very successful in the merchant service.

In France there is a school similar to the Greenwich Hospital School, of England, which receives the sons of sailors to the number of 400; a ship (the "Austerlitz") which has a complement of 800 boys, who are received between 13 and 14 and kept until 16, when they are transferred for further instructions to the "Bretagne." In this latter ship are nearly 1400 young men and boys under instruction, who are taken (with the exception of those from the "Austerlitz") from the various *divisions* established at the five principal naval ports and trained for specialties. All the foregoing are at Brest, which may be esteemed the headquarters of the French naval training system. After from four to six months' training on board the "Bretagne" (to which a small frigate is attached, which daily gets under way, being manned for a week at a time by one of the six companies into which the "Bretagne's" complement is divided) the young appren-

tices are distributed to the various schools of specialties: to the cruising training-ships (of which there are two), to train as topmen, and for quartermasters and signal-men; to the school of musketry at Lorient (a fifth of the ship's company of a French man-of-war being made up of these sailor-musketeers, no marines going to sea); and to the gunnery school at Toulon (similar to that on board the "Excellent," at Portsmouth). About 8000 men are at all times in the *divisions*, who undergo such instruction as can be given there; they are housed in capital barracks, and have at hand excellent means for drill and instruction otherwise than in seamanship. Each division has its permanent *cadre*, and has in divisions of the first class (those of Brest and Toulon) one company of seamen-gunners, one company of musketeers, one company of machinists and firemen, three companies of men of the *Inscription Maritime*, and one company of volunteers or conscripts. The *divisions* of the second class (Cherbourg, L'Orient, and Rochefort) have one company of seamen-gunners and musketeers, and two companies of *inscrits-maritimes* and recruits. Excellent schools have been established at the divisions, and there are good libraries open to the men, and means of amusement and exercise. Schools are established also on board of each ship, which are held four days in the week, such returns being made by the commanding officer that there is no chance of avoiding the regulations regarding these.

The French sailor is thus becoming a far less illiterate man than those of a few years since, 22 per cent. of the ship's companies knowing how to write and cipher in 1878, and 58 per cent. additional being able to read and write a little, but not to cipher.

The schoolmasters of the French navy are educated at Rochefort, where there is a normal school for that purpose; they are selected from the men of the service who desire to undertake these duties and are considered fit for them. The course comprises grammar and composition, arithmetic, French history, and geography in its principal branches.

To all the preceding should be added the school for firemen and machinists at Toulon, the training of instructors in gymnastics in the army school at Joinville le Pont near Paris, and the school of coast pilots, which furnishes pilots to the fleet, in ships which are employed on the French coast.

In each of the large ports of France are established schools for the free teaching of navigation to officers in the merchant service. The close connection of the navy and mercantile marine in France does away to a great degree with the necessity of specially training boys for the latter, as nearly all the merchant sailors in deep-sea ships are men of the *Inscription Maritime* who have taken service in these after having completed their time of service in the navy.

Germany has 400 boys at all times under training, the course lasting three years. They are received in October and spend the winter in barracks; in the spring they are placed on board ship for the summer, but do not leave the Baltic; in the fall they go again into barracks, and the succeeding year make a cruise at sea of eight months, and then return again into barracks. A very complete routine, which compels a great deal of work, is laid down; the ships in which they go to sea are fitted and laid up by the boys themselves; much infantry is taught, long marches being taken, and the whole course is a very rigorous one. These boys become the warrant and petty officers of the German navy, and certainly, if training can make good men, they are such. At Wilhelmshaven is the gunnery school of the German service, similar to those of the French and English. The Germans also have a school of pilots, and one for engineers and firemen.

Italy has also its school for seamen and for firemen, the course followed being similar to that of the French. Holland also trains the larger number of its men; indeed, throughout Europe a very great attention has been wisely given to this subject, and the sailors of the fleets of its greater powers are a very superior class of men to those of even a decade since.—*F. E. Chadwick, Lieutenant-Commander U.S.N.*

Navel Laver. The sea-weed *Ulva umbilicus.*

Navigable. Capable of being passed by ships or boats.

Navigant. An old word for sailor.

Navigation (Lat. *navigo*, to sail, from *navis*, a ship, and *ago*, to do business) may be defined as the art or science of conducting a ship from one part of the world to another.

The two fundamental problems of this art or science are, first, the determination of the ship's place at the present moment, and, second, the deciding on the future course to be steered to reach the desired port with the least delay and the least wear and tear of the vessel, and, if in a steamer, with the least expenditure of coal.

The limits of this article will not admit an elaborate account of the history of navigation, but it will be interesting to glance at a few of the improvements and discoveries which have gradually made the task of the navigator easier and his results more accurate.

Although the mariner's compass is supposed to have been used at an earlier period among the nations of the East, it was not commonly used by Europeans till about the year 1420. Until that time navigation was of a very rude and uncertain kind, being chiefly confined to coasting; when out of sight of land, rough bearings of the heavenly bodies affording the only indication of the course sailed. In 1485, Martin de Bohemia, a native of Fayal, calculated tables of the sun's declination for the use of navigators, and recommended the use of the astrolabe, an instrument consisting of a graduated circular arc, with sight attached for measuring altitudes of the sun and stars.

The variation of the compass was discovered about 1492, the credit of the discovery being claimed by Christopher Columbus and by Sebastian Cabot.

The first treatise on navigation in the English language appeared in 1561, being translated from the work of a Spanish author named Cortez.

About 1569 the first chart on Mercator's projection, so called, was published.

Early in the 17th century logarithms were invented by Baron Napier, and have proved of inestimable service to the art of navigation.

About the beginning of the last century, Sir Isaac Newton invented the reflecting sextant, which is still the principal instrument in nautical astronomy. See SEXTANT.

Among the later discoveries in navigation, that of finding the longitude with accuracy is the principal. To Dr. Nevil Maskelyne, an English astronomer, who determined the method during a voyage which he made to St. Helena in 1761 to observe the transit of Venus, we are indebted for the means of solving this problem by lunar observations, and to the rewards offered and paid by the British government the present degree of perfection of the solution by means of time-keepers is due. Of late years, probably the invention of the widest usefulness is that by Capt. T. H. Sumner, of finding a ship's position at sea, which will be described hereafter. Although known and practiced before Capt. Sumner's publication, it is now universally known as Sumner's method, and has been elaborated by many others, notably by Lieut. de Magnac, of the French navy, and Sir William Thomson.

Generally speaking, the place of a ship at sea is found by one of the four following methods: (1) by reference to one or more known and visible landmarks; (2) by ascertaining by sounding the depth of water and character of the bottom; (3) by calculating the direction and distance sailed from a previously-determined position; and (4) by ascertaining the latitude and longitude by observations of one or more of the heavenly bodies. See LATITUDE, LONGITUDE.

The first of these methods is readily employed when known landmarks are in sight, by determining simultaneously their bearings by compass, and laying off on the chart the lines of direction from these terrestrial points, when the place of the ship must necessarily be at the intersection of the lines of bearing. The exact position of the ship with regard to any landmark by which the ship is sailing is also determined by successive angles between the ship's course and the bearing of the landmark, in connection with the distance sailed between the bearings.

In thick, foggy weather, or at night, when not in the vicinity of a light-house, the second method becomes of great importance. When the depth of water is less than about 100 fathoms, a ship is said to be on soundings, and when near, though out of sight of land, the skillful navigator can, with the aid of the chart, ascertain a ship's place, and direct her course frequently with great accuracy by observed changes in the depth of water, or in the character of the bottom, as the ship proceeds on her way. See LEAD.

The third method is known as *Dead-Reckoning*, and consists in calculating from the recorded courses and distances the ship has sailed (see LOG) the amount of change in latitude and longitude to be applied to a previously-ascertained position to determine the present one. For this purpose the compass gives the direction the ship sails, and by the log is measured the distance on each course. Where the distance involved is small, no great error will be made by considering that part of the earth's surface sailed over as a plane, and when any two of the four elements, course, distance, difference of latitude, and departure, be given, the others may be found by the solution of a right-angled plane triangle, the term departure being understood as the distance in nautical miles made by the ship toward the east or west. This method of solution is known as *Plane Sailing*. *Parallel sailing* is employed where a ship's track lies along a parallel of latitude. *Middle-latitude* sailing is a combination of plane and parallel sailing, and is founded on the consideration that the arc of the parallel of middle latitude between two places, intercepted between the meridians of those places, is very nearly approximate to the departure.

Mercator's sailing is founded on the principles which govern the construction of Mercator's chart, in which all the meridians are parallel to each other, but proportionally lengthened, so as to conform to the spherical figure of the earth. (See CHART.) This method accurately solves the problems of spherical sailing, and is characterized by the use of a table of *meridional parts* found in all treatises on navigation.

If the course and distance sailed could always be accurately determined, the place of the ship could be computed with sufficient exactness by *dead-reckoning*, but these data can be only roughly approximated owing to errors in the estimated distance sailed, to unknown currents, faulty steering, errors in the assumed variation of the compass, or in its local deviation, and numerous other uncertainties. For this reason, when the weather will permit, a careful navigator loses no opportunity of determining the position of the ship by observations of the sun, moon, and stars.

Astronomy thus applied to navigation is termed *nautical astronomy*, and, concisely speaking, the problems solved by its practice are the determination of the latitude, the longitude, and the error of the compass by which the ship's course is directed.

For such determinations the navigator must have a sextant or quadrant (see SEXTANT, QUADRANT) for measuring the altitudes of heavenly bodies above the horizon, or their distances from each other, a watch or other time-piece to mark the instant of an observed altitude, distance, or bearing, one or more chronometers (see CHRONOMETER) to show the time at the first meridian, a nautical almanac (see NAUTICAL ALMANAC), an azimuth compass (see COMPASS), and a set of tables for facilitating computations. These tables are contained in all treatises on navigation, and are also published separately.

The simplest problem of nautical astronomy is the determination of the latitude from the altitude of a heavenly body when on the meridian, only its declination (or distance from the equinoctial measured on the meridian) and its angular distance from the zenith of the observer (the complement of its altitude) being required. Observations of the sun's altitude at apparent noon, or of a star's altitude at its meridian passage, give the latitude with the greatest facility.

As the altitude of the pole of the heavens above the horizon at any place is exactly the same as the latitude, the close approximation of the north star to the pole affords an excellent method of determining the latitude at any time when it and the horizon are visible, and tables have been computed affording the exact correction to be applied to its altitude for latitude determinations. To insure a greater degree of accuracy than can be obtained by one observation when exactly on the meridian, a number of altitudes may be observed when the body is near the meridian, taking, if practicable, an equal number before and after its meridian passage, and noting the time of each. These are called circum-meridian altitudes. The determination of latitude by the meridian alti-

tude of the moon is slightly more complicated and uncertain. The method of determining the latitude by two altitudes of the sun, moon, or stars, or by simultaneous altitudes of two bodies, though formerly much practiced has been almost entirely superseded by the practice of Sumner's method, which will be mentioned hereafter, and by which both latitude and longitude are determined at the same time with great accuracy.

As it is frequently the case that just at noon the sun is obscured, preventing the navigator from measuring its altitude when on the meridian, a most valuable method has been devised by which an altitude measured near noon can, within certain limits, when the time at the ship is approximately known, be used with great success for determining the latitude, and by careful navigators is very generally used, even in perfectly clear weather, as a check on the meridian observation.

The problem of finding the longitude at sea was formerly a very difficult one for navigators, and many ingenious devices have been practiced for its solution.

In 1700, Dr. Halley published a chart on which lines of equal magnetic variation were laid down, and it was proposed to ascertain the longitude by comparing the observed variation at the ship with the data on this chart; but the fallacy of the method was soon shown. A reward of £10,000 was for many years offered by the English government to any one who would devise an efficient method of determining the longitude at sea with accuracy, and this reward was finally divided between Mr. Harrison, who first made trustworthy chronometers, and Dr. Nevil Maskelyne, whose tables made the method of lunar distances practicable. The latter method is now, however, seldom used, the increased accuracy and decreased cost of chronometers having made their use almost universal.

Observations of eclipses, of occultations of the satellites of Jupiter and of stars by the moon, although of great value on shore, cannot be accurately made at sea on account of the ship's constant motion.

The determination of longitudes at sea by chronometer being effected by comparing the time at the ship with the time of the prime meridian as shown by the chronometer, it is necessary for the navigator before sailing to inform himself of the exact error of his chronometer on the time of the prime meridian, and of its daily rate gaining or losing. The determination of the time at the ship then becomes of the first importance. In consequence of the perpetual apparent revolution of the heavenly bodies, the exact measure of time is afforded by the observed hour-angle of a celestial object; that is, the angle at the pole contained between the meridian of the place and the celestial meridian passing through that body.

At sea, where the only fixed object to which the positions of the heavenly bodies can be referred is the horizon, the measurement of the altitude affords a ready and accurate method of determining the hour-angle. The hour-angle of the sun, reckoning westward from the meridian, is *apparent time*, which, by applying the equation of time from the Nautical Almanac, gives the desired mean time.

Mean time is determined from the hour-angle of a star or planet by allowing for the difference between the right ascension of the body observed and that of the sun.

Government vessels and many mail-steamers now almost universally carry three chronometers to guard against an accidental error.

The lunar method of finding the longitude at sea consists in an exact measurement of the moon's distance from the sun or from one of certain planets and stars, and a simultaneous determination of the local time.

This method was first proposed by John Werner, of Nuremberg, as early as 1514; but the theory of the lunar motion was for a long time after too imperfect to permit its practical application. The distance of the moon from the sun, from Jupiter, Saturn, Venus, and Mars, and from certain fixed stars, is given in the Nautical Almánac for every third hour of Greenwich mean time.

A measurement with a sextant or reflecting circle of the angle between the moon and any one of these bodies gives the apparent distance, to which various corrections are applied to obtain the *true distance*. From the Nautical Almanac by interpolation is found the Greenwich time corresponding exactly to this true distance, and by comparison with the time at the ship the longitude is deduced. Simple as this problem may appear, its rigorous computation is by no means brief, and, in spite of all precautions, the longitude thus obtained is liable to serious error, as the moon's motion among the stars being nearly thirty times slower than the rotation of the earth on its axis, any error in the observed distance will be multiplied by a factor nearly equal to thirty in the resulting longitude.

For this reason this method of obtaining the longitude is seldom practiced at present, except when trustworthy chronometers are not procurable.

As the latitude enters into the computation of the hour-angle, if the latitude is uncertain the longitude by chronometer is also uncertain to a greater or less degree; but if the Greenwich time by chronometer be trustworthy, the ship's position may be accurately determined by a process generally known as Sumner's method. This process is founded on the principle that the ship is somewhere on a constantly changing *curve of equal altitudes*, which may be defined as an arc of a circle joining points in different latitudes, where the sun or other heavenly body in question has the same altitude. If, therefore, two latitudes be assumed, one 10′ greater and the other 10′ less than that calculated for the ship, and the corresponding longitudes be ascertained, the ship's position will certainly (if her computed latitude be not in error more than 10′) be somewhere on a line drawn on the chart joining these two positions, as the small portion of the curve of equal altitudes between two points so close together would be almost exactly represented by a straight line. A second observation of the same or of a different body gives a second line of equal altitudes, and their intersection corrected for the run of the ship between the observations gives the position. When only one set of observations can be obtained giving one line, if this line is parallel to the shore the ship's distance from the shore is de-

termined, or if the line being produced passes through a point of land, the bearing of the point is known; and this information, combined with that derived from sounding, frequently serves to fix exactly the ship's position. The various cases in which Sumner's method may be utilized have been very fully elaborated by Lieut. de Magnac, of the French navy, in "La Nouvelle Navigation," by a recent writer in the "Nautical Magazine," and by Sir William Thomson, who has computed and published tables to facilitate the use of this method.

In addition to the instruments and books already mentioned, charts of the regions to be visited, with sailing directions and meteorological charts, are necessary to the navigator. The sailing directions contain accounts of the winds and currents for certain coasts and seas, with descriptions of the coasts and anchorages. From the various works of this kind information with regard to all the coasts of the world may be obtained, including the physical aspect of the shores, climate, and natural phenomena, as well as accounts of the manners and customs of the inhabitants, the productions, and articles of merchandise. The meteorological charts give information for each month in the year of the probable winds, weather, and currents the navigator will encounter, assisting him to direct his course to the best advantage.

From the position of the ship to the port of destination the shortest distance is on the arc of a great circle; *i.e.*, a circle the plane of which passes through the centre of the earth.

As, however, to keep on a great circle, except in the case of the equator or a meridian, a ship must constantly keep changing her course, great-circle sailing is practiced only when an appreciable distance may be saved without any corresponding disadvantage. Steamers between Europe and America almost invariably follow a great-circle track, and all telegraph-cables where practicable are laid on the arc of a great circle. On a Mercator chart a great-circle track is represented by a curve, but charts have been made on such a projection that a great-circle arc is shown by a straight line. The computation of the course and distance between two points on a great-circle arc is slightly more complicated than by Mercator's or middle-latitude sailing, and various devices have been invented to facilitate it; among the best of which are Prof. Chauvenet's Great-Circle Protractor, Mr. G. Herrle's Gnomonic Chart, Godfrey's Diagram and Tables, Towson's Index and Tables, etc.

When the distance to be saved by the practice of great-circle sailing is of no special importance, or when it is impracticable from other reasons, the straight course to be followed may be exactly computed by Mercator's sailing, or it may be shown on the chart by laying a ruler along the line joining the ports of departure and destination. The angle between this line and the meridians will be the true course to which the variation of the magnetic needle and its local deviation must be applied to determine the course to be steered. (See COMPASS.) For a more detailed account of the methods in use in navigation, the reader is referred to the "American Practical Navigator," by Dr. Bowditch; Professor Coffin's "Treatise on Navigation"; Lieut. Raper's "Practice of Navigation"; Harbord's "Glossary of Navigation," Professor Chauvenet's "Lunar Distances and Equal Altitudes," etc.—*Francis M. Green, Lieutenant-Commander U.S.N.*

Navigation Laws. The laws determining the national character of ships. See INTERNATIONAL LAW—4 (*b*).

Navigator. The officer or person to whom is intrusted the navigation of the vessel.

In the navies of the world the duties of this important position are performed by different officers. In some there is a special corps for it, in others one of the *line* or *executive* officers is detailed for the purpose.

In the merchant marine usually the commanding officer navigates the vessel; but sometimes the work is done by the first mate, under the supervision of the commander.

In the United States navy, formerly the junior line-officer of a man-of-war was by the regulations the navigator, under the title of the "master" of the vessel, and the title "sailing-master" was synonymous with that of navigator. Now the line-officer third in rank is the navigator, though for sufficient cause the proper authority may detail some other line-officer to do the duty, but this case rarely occurs.

The navigator's duties consist in shaping the vessel's course from port to port across the oceans and seas; finding her position at sea from time to time by observations of the celestial bodies and by dead-reckoning; piloting the vessel into port to her anchorage, and out again to sea, when pilots cannot be had; surveying, etc., when called upon, or in places where it is necessary from the meagre hydrographic information of the locality.

The navigator has charge of all the instruments, charts, and books pertaining to the navigation of the vessel, exercises a supervision over the anchors and cables, sees that they are properly secured at all times, that the cables are distinctly marked, and that all necessary arrangements are made for getting under way, anchoring, mooring and unmooring, slipping or shifting parts of a cable, and that the shackle-pins can be removed easily.

He has charge of the steering-gear, and sees that it is at all times in proper condition.

He must examine frequently the compasses, time-glasses, log- and lead-lines, and see that they are in proper order.

He has charge of the stowing of the hold, ballast, water, provisions, etc., and must place in the log-book plans specifying the quantity and arrangement of the ballast, the number, size, and disposition of the water-tanks, and the quantity and stowage of provisions and other stores.

He must inspect the hold, cable-tiers, chain-lockers daily, and see that they are kept clear and in good order, reporting to the executive-officer at 9.30 A.M.

He has charge of the time of the vessel, and must determine the error and rate of the chronometers before going to sea, and at all practicable places during the cruise.

He must make frequent observations for determining the local deviation of the ship's compasses on all courses, tabulating the results for use in shaping the vessel's course, and place a copy of the result in the log-book.

He must make tidal observations at all places visited where careful observations have not been made.

He must keep a book in which all calculations connected with the navigation of the vessel are made; no erasures are allowed, but the book must be a complete record of all observations, computations, and results, with their date. At the end of the cruise the book is to be sent to the Bureau of Navigation.

He has charge of the ship's log-book, commencing it when the vessel is put into commission, sees that all particulars are duly entered according to prescribed forms, that the watch-officers sign their remarks daily, and takes it to the commanding officer for his inspection at noon each day. He sends a certified copy to the commanding officer for transmission to the Bureau of Navigation every six months. See LOG-BOOK.

At sea he ascertains and reports daily to the commanding officer the position of the vessel at 8 A.M., at meridian, and at 8 P.M., and makes daily observations for the variation of the compass, when the weather permits, with such other determinations as the commanding officer may direct.

In every port he must determine the variation of the compass free from local deviation.

When there are three, or less than three watch-officers on duty, he will be required to keep a night-watch.

He is also ordnance-officer of the vessel, and in action or battle handles the ship under direction of the commanding officer.—*J. E. Noël, Lieutenant-Commander U.S.N.*

Navvies. The vigorous laborers employed in cutting canals, railroads, or river works in temporary gangs.

Navy. The armed force of a nation operating at sea or on coast and harbor defense.

NAVY OF THE UNITED STATES (1775 TO 1812).—The navy came into existence soon after the Declaration of Independence, and was based upon the laws of Congress preceding and following that declaration.

Descendants of a warlike nation, whose security on land and supremacy at sea were manifestly due to her naval power, it was natural that the wisdom of the leading statesmen should have turned their thoughts in this direction.

The country was rich in her forests, which afford a variety of timber suitable for ship-building, and was not entirely destitute of mechanics and artisans, but was compelled to rely almost entirely upon a foreign market for ordnance, ammunition, sails, rigging, etc., for an outfit suitable for cruisers before passing into the hands of the officers and crew who were finally to man and control them.

As early as October 13, 1775, an act of Congress authorized the building of one vessel of 10 guns and another of 14 guns, to be equipped as national cruisers. At the same time a law was passed establishing a *marine committee*, consisting of Messrs. John Adams, John Langdon, and Silas Deane, the place of Mr. Adams being afterwards supplied by Mr. Gadsden.

This committee, subsequently enlarged to 13, was chosen by Congress from its own body and given control of all naval matters.

October 29, a resolution was passed forbidding privateers and merchantmen wearing pennants in the presence of Continental ships or vessels of war without the permission of the commanding officers of the latter. The following day another law was passed authorizing the fitting out of two more cruisers, one to be armed with 20 guns, the other with 36 guns; and following this (December 13), the construction of 13 vessels, 3 of which were to be armed with 24 guns each, 5 with 28 guns, and 5 with 32 guns, was authorized. In the mean time the immediate wants of the service were supplied by purchasing and equipping such vessels as could be procured in open market.

These vessels constituted the first naval force of the country. They were as follows:

Ship "Alfred," 24 guns.
" "Columbus," 24 guns.
Brig "Lexington," 16 guns.
" "Cabot," 16 guns.
" "Reprisal," 16 guns.
" "Andrea Doria," 14 guns.
" "Hampden," 14 guns.
" "Providence," 12 guns.
Schooner "Wasp," 8 guns.
" "Fly," 8 guns.
Sloop "Hornet," 10 guns.
" "Independence," 10 guns.
" "Sachem," 10 guns.
" "Mosquito," 4 guns.

In this hastily improvised force were represented the various types of vessels carrying their battery on one deck, with which were fought the first battles of the Revolutionary war. They were ordered to cruise on the coast and intercept transports laden with munitions of war intended for the English army or navy.

To officer, man, and equip this little fleet from the raw material of the country, and in the absence of educated and trained officers, of arsenals, store-houses, and dock-yard facilities, was a labor perhaps little less than that encountered by the sailor King Alfred, 1000 years previous, in fitting out the fleet that he personally commanded against the Danes.

There was no lack of patriotism and activity in this transition period of the country; but there was necessarily a want of order and system, which experience and time alone could supply.

The act of Congress, December 22, appointed the following officers:

Ezekiel Hopkins, commander-in-chief.
Dudley Saltonstall, captain of his flag-ship "Alfred."
Abraham Whipple, captain "Columbus."
Nicholas Biddle, captain "Andrea Doria."
J. B. Hopkins, captain "Cabot."

First Lieutenants.

John Paul Jones,* "Alfred."
Rhodes Arnold, "Columbus."
—— Stansbury, "Andrea Doria."
Hoysted Hacker, "Cabot."
Jonathan Pitcher, "Hornet."

Second Lieutenants.

Benjamin Seabury, "Alfred."
Joseph Olney, "Columbus."
Elisha Warner, "Andrea Doria."
Thomas Weaver, "Cabot."
—— McDougal, "Alfred."

* Claims to have first hoisted the American flag (pine-tree and rattlesnake) on board of the "Alfred," lying in the Delaware River, December, 1775, upon the occasion of Commodore Hopkins's visit to her.

Third Lieutenants.

John Fanning, "Columbus."

Ezekiel Burroughs, "Andrea Doria."

Daniel Vaughn, "Cabot."

The "Alfred," "Columbus," "Cabot," "Andrea Doria," "Providence," "Wasp," "Fly," and "Hornet" composed the squadron of Commodore Hopkins, that put to sea February 17, 1776, bound to the West Indies. On the second night out the "Hornet" and "Fly" parted company, and did not rejoin during the cruise. The remainder of the squadron finally made a descent upon New Providence, capturing some military stores, including nearly 100 cannon, which were much needed at this period in arming cruisers.

Leaving here March 17, and taking with him the governor and a few other persons of note, Hopkins returned North, and off Long Island fell in with and captured an English bomb-brig of 8 guns, a tender of 6 guns, and had a running fight of several hours with H. B. M. ship "Glasgow," of 20 guns, which made a very creditable defense, and finally escaped by good management. Early in April the squadron arrived in New London, and in October following Congress passed a vote of censure upon the commanding officer for not performing the duties upon which he had been sent, and he was dropped from the service in the following year, January 2.

Thus ended the title of "Commander-in-Chief of the Navy," except as applied to the President, as the commander-in-chief of both army and navy.

March 23, letters of marque and reprisal were issued by the Continental authorities of the United States against Great Britain, and on February 7 following, retaliatory edicts were issued by the latter.

June 25, a marine corps, consisting of a major (Samuel Nichols), 9 captains, 10 first and 7 second lieutenants, was appointed.

See, also, acts of January 8, 1780, and July, 1798.

Following the Declaration of Independence, July 4, 1776, was an effort to equip the fleet already ordered, and the following officers were assigned to their respective vessels in the order of rank:

James Nicholson, to command the "Virginia," 28 guns.

John Manley, to command the "Hancock," 32 guns.

Hector McNiel, to command the "Boston," 24 guns.

Dudley Saltonstall, to command the "Trumbull," 28 guns.

Nicholas Biddle, to command the "Randolph," 32 guns.*

Thomas Thompson, to command the "Raleigh," 32 guns.

John Barry, to command the "Effingham," 28 guns.

Thomas Reed, to command the "Washington," 32 guns.

Thomas Grennall, to command the "Congress," 28 guns.

Chas. Alexander, to command the "Delaware," 24 guns.

Lambert Wickes, to command the "Reprisal," 16 guns.†

Abraham Whipple, to command the "Providence" (2d), 28 guns.

John B. Hopkins, to command the "Warren," 32 guns.

John Hodge, to command the "Montgomery," 24 guns.

William Hallock, to command the "Lexington," 16 guns.

Hoysted Hacker, to command the "Hampden," 14 guns.

Isaiah Robinson, to command the "Andrea Doria," 14 guns.‡

John Paul Jones, to command the "Providence," 12 guns.

James Josiah, to command the "Camden" (galley).

Elisha Hindman, to command the "Alfred," 24 guns.

Joseph Olney, to command the "Cabot," 14 guns.

James Robinson, to command the "Sachem," 10 guns.

John Young, to command the "Independence," 10 guns.

Elisha Warner, to command the "Fly," 8 guns.

November 9, a law was passed authorizing the building of the first line-of-battle ship of 74 guns; her keel was laid at Portsmouth, N. H., where she was completed in 1781, and named the "America"; her armament was reduced to 56 guns, and in the following year she was presented by the government to Louis XVI. of France to replace the "Magnifique," 74, lost in Boston harbor.

The same month, a Continental Navy Board, consisting of three persons, was appointed subordinate to the Marine Committee. These were John Nixon, John Wharton, and F. Hopkinson, who were supposed to be skilled in maritime affairs; they were given a salary of $1500 each per annum, and were empowered to regulate the rank of lieutenants and subordinate officers.

November 15, 1776, Congress apparently contemplating higher grades of rank in the navy, established the following relative rank between the navy and army officers:

Admiral, with general.

Vice-Admiral, with lieutenant-general.

Rear-Admiral, with major-general.

Commodore, with brigadier-general.

Captain of a 40-gun ship and upwards, with colonel.

Captain of a 20- to 40-gun ship, with lieutenant-colonel.

Captain of a 10- to 20-gun ship, with major.

Lieutenant, with captain.

And officers of marines with similar commissions in the land service.

The first four naval grades above were only created by law in 1862, although in the official correspondence of the State Department the title of admiral was conceded to John Paul Jones just previous to his death, in 1792, and his commission may have been so worded, though I find no law

* Was completely dismasted on the coast in a gale, in 1779. Subsequently lost a mast by a stroke of lightning, and was finally blown up at sea, March 7, 1778, during an action with H. B. M. ship "Yarmouth," 64 guns, and all but 4 out of 315 souls perished.

† The first American vessel of war that visited European waters, where she took several prizes this year, and being joined by the "Lexington" and "Dolphin" in the following year, cruised in English waters, making captures and causing a sensation that raised the rates of insurance 25 per cent. In 1778 foundered at sea, and all but the *cook* lost.

‡ Received the first foreign salute, which cost the Dutch governor of St. Eustatia his commission.

creating the title. The subordinate grades of master, surgeon, purser, chaplain, midshipman, boatswain, gunner, carpenter, and sailmaker, came early into existence with prescribed duties, pay, and responsibilities corresponding very much to those of the English service, from which the navy very naturally copied.

The same is true in regard to naval laws, regulations, and customs, as well as naval construction, armament, etc., which have since undergone many changes. Vessels at this period were poorly armed and hastily put together; often built of green timber, which decayed in a few years.*

By those familiar with the early history of the country it will be noticed that several very spirited conflicts of a nautical character took place that have been passed over, for the reason that they were not purely naval. One of these was fought by Capt. Broughton, of Marblehead, who, upon the authority of the biographer of Gen. Washington (Mr. Sparks), was the first officer commissioned by him in the navy.

It would be difficult at this day to name or properly locate all of the early appointments that were made. Some had but a brief existence, and changes were frequent.

Limited appointments were conferred abroad by the minister to France, Dr. Franklin, who was also authorized to purchase or accept the loan of vessels from foreign subjects. Among these were the "Duras," "Pallas," "Cerf," and "Vengeance," which, with the "Alliance," composed the little squadron that cruised in English waters under Commodore J. P. Jones in 1779, making many captures. While in command of the former (her name being changed to the "Bon Homme Richard") he engaged H. B. M. ship "Serapis," Capt. Pearson, September 23, in the British Channel, and captured her after one of the most obstinate naval duels on record. The ships were nearly equally armed and manned, and each lost about one-half of her crew in killed or wounded; the former sank two days after the action.

October 28, 1779, naval administration was intrusted to a Board of Admiralty consisting of five persons, three of whom were Congressmen, and these were given control of all naval and marine affairs. April 20, 1780, this board drafted the commission which in substance is the same as that now issued to all officers entitled to a commission.†

February 7, 1781, Secretaries of War, Finance, and Marine were appointed. The latter office was conferred upon Brig.-Gen. Alex. McDougall, who had been a seaman in his early manhood, with all the powers and duties previously confided to the Board of Admiralty, and in the following August an Agent of Marine was appointed to supersede all agents, boards, or committees previously established by law. The duties of this office subsequently devolved upon the celebrated Robert Morris, who was the Secretary of Finance until November, 1784.‡

For some reason there appears to have been much difficulty in finding the right man to place at the head of the navy, and these frequent changes operated unfavorably to the service in many ways. The war of the Revolution had witnessed many gallant encounters and the capture of some 800 prizes. Nevertheless, the navy had suffered severely, losing by capture 11 vessels of war, besides the little fleet of gunboats on Lake Champlain; so that, including 13 others destroyed to prevent their falling into the hands of the enemy, with 3 foundered at sea and 5 condemned or sold, the country was virtually without a navy from 1780 to 1785. A treaty of peace, however, had been concluded with Great Britain as early as September 23, 1783.

Taking advantage of this lull, commerce increased, and ventured into the Mediterranean, where in its defenseless condition it soon became a prey to the cruisers of the Barbary powers. This revived the naval problem, and demonstrated to the country not only the necessity of providing a navy capable of protecting our commerce abroad, but that it should be placed upon a more permanent basis at home, by constructing docks, arsenals, etc., and by building ships under the supervision of experienced naval officers.

August 7, 1789, the Secretary of War was given control of naval affairs.

It was during this and the following year that the American ship "Columbus" and sloop "Washington" circumnavigated the globe,—the first American vessels it is believed that accomplished this feat.

Efforts at negotiation with the Barbary powers failed; up to 1793 13 vessels had been captured by the Algerine corsairs, and their officers and crews, to the number of 119, had been confined as prisoners, when President Washington recommended the building of 6 frigates, which recommendation a subsequent act of Congress, March 27, 1794, adopted, prescribing that 4 of them should be armed with 44 guns each, and 2 with 36 guns.

Other sections of the law prescribed the number of officers and men of each grade, including pay and rations, that should make up the complement of each class of vessels. Naval constructors and agents were also appointed.

It is worthy of record that at this early date an act prohibiting the slave-trade was passed.

A treaty of peace with Morocco, Algiers, and Tripoli following in 1796, the number of frigates previously authorized was reduced one-half. In the discussion that arose in Congress in regard to this reduction, the President strongly urged a gradual increase of the navy, remarking that "it is our own experience that the most sincere neutrality is not a sufficient guard against the depredations of nations at war," that "the protection of a naval force is indispensable to an active, external commerce," and that "to secure respect to a neutral flag requires a naval force organized and ready to vindicate it from insult or aggression."

1797.—The frigate "Constitution," 44 guns, was launched at Boston; the "United States," 44 guns, at Philadelphia; and the "Constella-

* June 14, 1777, it was "Resolved, That the flag of the thirteen United States be 13 stripes, alternate red and white; that the union be 13 stars, white, in a blue field, representing a new constellation."

† The "Saratoga," 16 guns, Capt. J. Young, was lost at sea this year and never after heard from.

‡ August 5, 1783, he reports "that it is an object highly desirable to establish a respectable marine, yet the situation of the public treasury renders it not advisable to purchase ships for the present, nor until the several States shall grant such funds for the construction of ships, docks, and naval arsenals, and for the support of the naval service as shall enable the United States to establish their marine upon a permanent and respectable footing."

tion," 36 guns, at Baltimore. Each of these ships has won an enviable reputation in the navy. The first and last still belong to the service. Their timbers have of course been often renewed, as the life of a ship seldom exceeds 15 years; but their name and fame will outlast the material of which they are constructed.

They were beautiful models of their time, with strength and stability, carrying capacity, sailing and manœuvring qualities, that modern types have not always improved upon. They were modeled by Naval Constructor Samuel Humphries, and built under the superintendence of Commodores Samuel Nicholson, John Barry, and Thomas Truxtun. The first two had a length of 175 feet, beam 43½ feet, and depth of hold 14¼ feet, with a tonnage of 1607, old measurement. The latter was: length, 161 feet; beam, 40 feet; depth of hold, 13½ feet; and tonnage, 1278. Their batteries frequently underwent change conformably to the continual changes in ordnance.

April 30, 1798, the Navy Department was established, and Benjamin Stoddart became the first Secretary of the Navy, with a salary of $3000 per annum. The marine corps was re-established, and there were added to the navy 11 ships, carrying from 18 to 24 guns, and as many smaller vessels, carrying from 10 to 18 guns each.

The *personnel* available for this reorganized navy was 28 captains, 7 master-commandants, and a proportionate number of lieutenants and other subordinate officers.

Among the lieutenants was Charles Stewart, who alone lived to be promoted to the rank of admiral, and was probably the only survivor in 1862.

To our republican form of government, our growing and competing commerce, our weakness as a naval power, or to all combined, may perhaps be attributed a certain unfriendly spirit on the part of European powers,—especially manifested in the changed relations of France, and the wanton attacks of her cruisers upon the commerce of the country,—until forbearance ceasing to be a virtue, the acts of May 28 and July 9 authorized the President to instruct the commanders of public armed vessels and privateers, duly commissioned, to make reprisals.

The Secretary of the Navy urged in his report to Congress a large increase of the navy, adding, "that it should be so augmented as to make the most *powerful* nations desire our friendship, and the most *unprincipled* respect our neutrality."*

March 2, 1799, an act was passed deducting 20 cents per month from the pay of each officer, seaman, and marine of the navy to constitute a hospital fund.

To carry out previous instructions the following squadrons were dispatched:

Windward Islands. Rendezvous, Rupert's Bay:
"United States," 44, Commodore John Barry.
"Constitution," 44, Captain Samuel Nicholson.
"George Washington," 24, Captain P. Fletcher.
"Merrimack," 24, Captain Moses Brown.
"Portsmouth," 24, Captain Danl. McNiel.
"Herald," 18, Master-Commander C. C. Russel.
"Pickering," 14, Lieut.-Commander E. Preble.
"Eagle," 18, Captain H. G. Campbell.
"Scammel," 14, Captain J. Adams.
"Diligence," 12, Captain J. Brown.

Leeward Islands. Rendezvous, St. Kitts:
"Constellation," 36, Commodore T. Truxtun.
"Richmond," 18, Captain Samuel Barron.
"Baltimore," 20, Captain Isaac Phillips.
"Norfolk," 18, Captain Thomas Williams.
"Virginia," 14, Captain Francis Bright.

To guard the passage between Cuba and San Domingo:
"Ganges," 24, Commodore Thomas Tingey.
"Gen. Pinckney," 18, Captain S. Hayward.
"South Carolina," 12, Captain J. Payne.

To cruise off Havana:
"Delaware," 20, Captain S. Decatur, Sen.
"Gen. Green," 10, Captain Geo. Price.
"Gov. Jay," 14, Captain J. W. Leonard.

The act of March 2, 1799, for the government of the navy of the United States, was followed by the act of April 3, 1800, for the *better* government of the navy of the United States, usually known as the *Articles of War*, that have since been in force, and are frequently read to the officers and crew assembled on the quarter-deck of vessels in commission.

In 1800 the seat of government was transferred to Washington, D. C.

The previous acts of Congress of May and July, 1798, amounted to a virtual declaration of war against France, and during its continuance till the close of 1800 nearly 100 prizes were captured by the squadrons previously named, and many sharp conflicts occurred between single vessels, which were generally short and decisive, and reflected credit upon the young navy.

Among these were the actions of the U. S. S. "Constellation," Commodore Truxtun, with the French frigate "L'Insurgente," in 1799, and "La Vengeance," in 1800, in which the enemy were superior in number of guns and men, and suffered a greater loss in killed and wounded. In the latter action the enemy opposed a battery of twenty-eight 18-pounder, sixteen 12-pounder, and eight 42-pounder carronades to the "Constellation's" twenty-eight 18-pounder and ten 24-pounder carronades; the latter are believed to be the first ever used in the United States service, and are only effective at very close quarters.

The "Constellation" lost her mainmast in this action, Midshipman Jarvis and all the topmen going with it. Commodore Truxtun was given a gold medal for his gallantry by an act of Congress.

The U. S. brig "Pickering," commanded by Lieut. Hillar, that sailed in August of this year on a cruise to the West Indies, was never more heard from.

* The committee in Congress appointed to take this matter into consideration sustained and amplified the Secretary's recommendations.

Then followed a lively debate, upon which the opponents of course wished to impress upon their constituency, if not the country, that they were in favor of *economy and retrenchment*, and above all, that they were opposed to "*large military and naval organizations as dangerous to the liberties of the people*"! A very ancient weapon, but fortunately having no application to either the army or the navy so far as its present history. The contest finally ended in giving discretionary power to the Secretary to erect a dock, to increase the number of men and guns in certain vessels, and to have built 6 line-of-battle ships, none of which were launched until after the war with Great Britain.

The theory of the English government, that their subjects wherever found owed their first allegiance to the crown, was exemplified this year in the seizure of 5 men on board of the U. S. S. "Baltimore," Capt. Phillips, off Havana, by the British squadron under Commodore Loring, resulting in the dismission of the former and instructions from President Adams, through the Secretary of the Navy, to the commanders of all United States vessels of war to resist to their utmost any future insult of detention, search, or seizure, and when no longer able to resist, to surrender the vessel, but not the men without the vessel.

The whole expense of the navy up to this period, including the purchase of six sites for navy-yards, was estimated at about $10,000,000, while the annual exports had increased to $93,-000,000, and the revenue to $10,000,000.

February 3, 1801, a treaty of peace was ratified with France, and Capt. C. C. Russel was dispatched with the "Herald" to recall the squadrons in the West Indies.

By the act of March 3, the navy was reduced to a peace-footing by the sale of all the remaining vessels, excepting the frigates "Constitution," "Adams," "General Green," "Constellation," "J. Adams," "New York," "Congress," "Boston," "President," "Chesapeake," "Essex," "Philadelphia," and the schooner "Enterprise." Those sold were first divested of their armaments and stores, and brought less than it would now cost to build a first-class frigate.

Their services, however, in protecting commerce and maintaining the honor of the country cannot well be estimated.

Unfortunately, this reduction of the navy occurred at a period when the bashaw of Tripoli was threatening to dispatch his cruisers to prey upon the commerce of the country unless presents were immediately sent him, adding that he had always exacted this from the English, French, and Spaniards.

The bey of Tunis made demands no less importunate, saying that Denmark, Spain, Sicily, and Sweden had made concessions to him, and that if the President did not send him without delay forty cannon of *different calibres* (adding that he wished them all to be 24-*pounders*), besides 10,000 stand of arms, peace would be no longer possible.

The dey of Algiers, to whom the government presented the frigate "Crescent" in 1798, was also becoming inconsolable again.

The government therefore wisely concluded that an exhibition of force instead of presents would better meet the occasion.

Commodore Dale was dispatched January 1, 1801, with a small squadron to the Mediterranean, with full instructions from Secretary S. Smith to meet all demands, and, if necessary, to punish these insolent people. "Millions for *defense* but not *one cent* for *tribute*" had become the watch-word.

This squadron consisted of the frigate "President," 44, flag-ship, Capt. Jas. Barron; frigate "Philadelphia," 36, Capt. Sam. Barron; frigate "Essex," 32, Capt. Wm. Bainbridge; schooner "Enterprise," 12, Lieut. Sterrett.

The commodore reached Gibraltar in July, where he found at anchor a Tripolitan ship of 26 guns and a brig of 16 guns, which looked suspicious; but the officers declared that they were not at war with the United States, and the contrary did not fully appear until their arrival at Malta.

Lieut. Sterrett, in the "Enterprise," had in the mean time, August 1, fallen in with and captured a Tripolitan corsair of 14 guns, her commander, Mahomet Sous, making an obstinate resistance, and being rewarded on his return to Tripoli in his disarmed vessel, used as a cartel, by a public "bastinado." Lieut. Sterrett, for his gallant conduct on this occasion, was rewarded by the presentation of a sword by Congress.

President Jefferson, in alluding to this duel in his message to Congress, remarked that "the measure was seasonable and salutary; . . . the bravery exhibited by our citizens will, I trust, be a testimony to the world that it is not a want of that virtue which makes us seek their peace."

The bashaw of Tripoli still declining all friendly overtures, and refusing to surrender American prisoners in his possession, Congress enacted laws that were equivalent to a declaration of war as early as February 6, 1802, and a squadron was sent out to relieve Commodore Dale. This squadron was under the command of Commodore R. V. Morris, and consisted of the following vessels:

"Chesapeake," 38, flag-ship, Lieut. Chauncey.
"Constellation," 36, Capt. A. Murray.
"New York," 36, Capt. Jas. Barron.
"Adams," 32, Capt. H. G. Campbell.
"John Adams," 32, Capt. John Rodgers.
"Enterprise," 12, Lieut. A. Sterrett.

Commodore Truxtun had been selected for this squadron, but declined on a question of a flag-captain.

The crews were shipped for two years instead of one, as heretofore. The ships were well officered and manned; but the guns were mostly ill suited to long-range bombardment.

Commodore Morris was also authorized to detain the U. S. S. "Boston," Capt. McNiel, then in the Mediterranean; also to purchase from the European powers some small gunboats, to protect commerce in the Strait of Gibraltar and assist in blockade duty.

The vessels sailed as they were ready, and arrived out at different periods between May and September. The "Chesapeake" sprung her mainmast and the "Constellation" her foremast on their way out. The latter was the first frigate to reach Tripoli, and the first to open hostilities by an attack upon some gunboats that were driven on shore near Tripoli.

The commodore reached Gibraltar May 25, where he found Capt. Bainbridge in the "Essex" blockading a Tripolitan ship of 22 guns. Malta was the port appointed as a rendezvous, where the squadron finally assembled.

The year passed without anything especial being accomplished, and Commodore Morris was subsequently censured for this.

1803.—Early this year the squadron visited the Barbary powers that were evidently in collusion with each other and meditating mischief.

Commodore Morris transferred his flag to the "New York," and sent the "Chesapeake" home under Capt. J. Barron. Being recalled in June, he returned home in the "Adams"; he was censured by a court of inquiry, and in the following year was dismissed from the service by the President. This left the squadron in command of Commodore J. Rodgers, who was in turn relieved by Commodore Ed. Preble, at Gibraltar, September 12, 1803, having previously destroyed the "Meshouda," of 22 guns, when attempting to evade the blockade off Tripoli,* June 21.

Commodore Preble's squadron consisted of his flag-ship "Constitution," 44 guns; ship "Philadelphia," 36 guns, Capt. W. Bainbridge; brig

* This vessel, originally Tripolitan, then belonged to the emperor of Morocco, and is the same one previously mentioned as blockaded at Gibraltar.

"Siren,"* 16 guns, Lieut. C. Stewart; schooner "Vixen,"* 14 guns, Lieut. J. Smith; schooner "Nautilus,"* 12 guns, Lieut. R. Somers; brig "Argus,"* 16 guns, Lieut. I. Hull; schooner "Enterprise," 12 guns, Lieut. S. Decatur, already in the Mediterranean.

As in the case of the previous squadron, the vessels left the United States singly as their outfits were completed, and had an average passage of 35 days to Gibraltar.

August 26, the "Philadelphia" being off Cape de Gatt, fell in with and captured the armed ship "Meshboha," of 22 guns, belonging to Morocco, having in company the American brig "Celia" as a prize. The officers confessed they were ordered by the governor of Tangier to capture American vessels; and this necessitated a visit of the squadron to Tangier, where the emperor of Morocco expressed his regrets that any hostile acts had been committed, declared that he would punish the authors, and would release all vessels previously captured under the orders of his governors; and further, that he would ratify the treaty made by his father in 1786, adding "that his friendship for America should last forever." Friendly salutes were exchanged, and Commodore Rodgers sailed for the United States. Commodore Preble sailed up the Mediterranean, after touching at Cadiz and Gibraltar, and reached Malta on the 27th of November, where he received a confirmation of the report of the loss of the U. S. S. "Philadelphia," Capt. Bainbridge, off Tripoli, Oct. 31, 1803, having run upon a rock while endeavoring to intercept the enemy's vessels near the land. The officers and crew of the "Philadelphia," numbering 307 souls, became prisoners, and were retained as such during the war. This unfortunate accident increased the pretensions of the enemy, and rendered peace negotiations more difficult. A subsequent decision of a court of inquiry held at Syracuse exonerated Capt. Bainbridge from all blame for the loss of his ship. The sailor of the present day, with the advantages of steam and reliable charts, would not have fared so well.

Previous to surrendering the ship, Capt. Bainbridge had, while under the fire of the enemy's gunboats, made every effort to extricate her by cutting away the foremast, throwing overboard guns, etc. The enemy, with the aid of their gunboats and the high tides, were more successful a few days after, not only floating the vessel into their harbor, but weighing and remounting her guns, thus affording a temptation for her destruction, which was not long deferred. December 23, Lieut. Decatur, in the "Enterprise," captured the ketch "Mastico," loaded with female slaves, and bound to Constantinople as a present to the Porte. This vessel was taken into the service under the name of the "Intrepid," and armed with 4 guns. The cargo was of course released.

February 3, 1804, having been prepared with a view of destroying the "Philadelphia," she was placed in charge of Lieut. S. Decatur, and dispatched from Syracuse by Commodore Preble, with a crew, including officers, numbering 75 souls, all volunteers, and under the escort of Lieut. Charles Stewart in the "Siren." February 9, Tripoli was sighted, but owing to gales and stormy weather a favorable opportunity did not offer until the night of the 16th, when, favored by the darkness, Lieut. Decatur laid his vessel alongside of the "Philadelphia," drove the Turks overboard, set fire to the ship, and in less than half an hour was sweeping the "Intrepid" out of the harbor under the fire of the batteries, 2 corsairs, and 1 galley, which was returned by the guns of the "Philadelphia" as the fire progressed and the guns became heated.

As this has been regarded as one of the best planned and most successful and gallant feats of this war, I here add the names of the officers who volunteered and took part in it: Lieut. Commandant S. Decatur, in the "Intrepid"; Lieuts. J. Lawrence, J. Bainbridge, J. Thorn; Surgeon Heerman; Midshipmen C. Morris, T. McDonough, R. Isard, A. Laws, J. Davis, J. Rowe, T. O. Anderson; Pilot Salvador Catalano. All of these officers were promoted.

During March, Lieut. Stewart, in the "Siren," captured the brig "Transfer," of 16 guns and 80 men, while attempting to run the blockade. She had an English commission. Was taken into the service, and named the "Scourge."

Commodore Preble, who had made his headquarters at Syracuse, was in the mean time preparing his squadron for more serious work. Leaving here July 14, in the "Constitution," with 8 brigs, 3 schooners, 6 gunboats, and 2 bomb-vessels, he touched at Malta, and appeared off Tripoli on the 25th. Here he found opposed to him batteries mounting 115 cannon of various calibre, 19 gunboats, 1 brig of 10 guns, 2 schooners of 8 guns each, and 2 galleys, all moored in front of the town.

The *first attack*, August 3, was made by all the squadron, the "Constitution" covering the smaller vessels and occasionally delivering a broadside at the batteries, which could only be reached by the thirty long 24-pounders mounted on her gun-deck, and six 26-pounders mounted on the spar-deck, if the shells thrown by the mortar-vessels are excepted, and a shot from a long 24-pounder carried by each of the gunboats which was used against their immediate foe afloat. The bombardment lasted two hours, and resulted in the death of Lieut. James Decatur, and 13 wounded; the enemy had 3 of their gunboats sunk, 3 captured, and suffered more severely in killed and wounded.

The *second attack*, August 7, lasted three hours. The 3 prize gunboats, numbered 7, 8, and 9, went in under the command of Lieuts. Crane, Caldwell, and Thorn. After being engaged about one hour, No. 8 received a hot shot through her magazine and blew up, killing her commander, Lieut. Caldwell, and Midshipman Dorse and 6 men, and wounding as many more. The other vessels received more damage aloft than in their hulls. The "Constitution" remained out of this action, but maintained a signal supervision. During the evening the "John Adams," 28, Capt. Chauncey, arrived with stores and dispatches from the United States.

The *third attack*, August 24, was made by two bomb-vessels sent in to practice upon the town without drawing the enemy's fire, and it was sub-

* Built under the act of February 28, the brigs having a battery of two long 12-pounders and sixteen 24-pounder carronades; the schooners two long 9-pounders and twelve 18-pounder carronades. They were a class of vessels much needed on this service, and having survived this war, were all captured in the subsequent war with England.

sequently learned that all the shells fell short, and of those previously fired, only one burst owing to defective fuzes. This was learned from Capt. Bainbridge, who occasionally communicated with the squadron.

The *fourth attack*, August 28, was a night attack. All the small vessels, excepting the bomb-brigs, accompanied by the boats of the squadron, were sent in, and were joined by the commodore, in the "Constitution," at daylight. The rapidity and accuracy of the latter's guns created much loss and havoc among the enemy, sinking one of their gunboats and driving others ashore. A boat belonging to the "John Adams" was destroyed by a double-headed shot, and 3 of the crew killed. Nothing more serious occurred. Seven hundred shot had been fired by the flag-ship, and the enemy confessed that they had been roughly handled.

The *fifth attack*, September 3, was made by the whole squadron, and lasted for one and a half hours, the enemy judiciously changing their tactics and gradually retreating when hard pressed. The "Constitution" ran in close, and as her broadside would bear, silenced the enemy's batteries by her rapid and well-delivered fire. That she should have escaped with only slight damage aloft is due to poor gunnery on the part of the enemy. The bombards suffered more severely, but no one was killed.

Following this last squadron attack, and during the next night, the ketch "Intrepid," that had been employed in destroying the "Philadelphia," was sent in with powder and combustibles and a picked crew to destroy the shipping in port. For some cause which will never be known she blew up when near her destination, killing all on board, including her commander, Lieut. Commandant R. Somers, H. Wadsworth, J. Israel, and 10 men.

In the language of the naval historian Cooper, this "scene of sublime destruction" was really the last blow aimed at this weak and arrogant power, and was a sad winding up of a war lasting over three years on an exposed and miserable coast, in which ships, officers, and men suffered alike in wear and tear. It was, nevertheless, an excellent school for professional training, while it taught a severe lesson to the Mohammedan race, and put an end to further tribute.

A few days later, September 10, the frigate "President," Commodore Samuel Barron, and the "Constellation," Capt. H. Campbell, arrived, when the squadron was turned over to the former, and Commodore Preble left for Malta, taking with him the two prizes captured on the 12th. At this port he turned over the "Constitution" to Capt. S. Decatur, and proceeded to Syracuse in the "Argus," from thence home in the "John Adams," where, upon his arrival, he was presented with a gold medal and the thanks of Congress to himself, officers, and crew for gallant and faithful services.

In November, Capt. J. Rodgers being senior officer, was transferred to the "Constitution," and Decatur to the "Congress."

The blockade of Tripoli was still maintained, and to create a favorable diversion a combined sea and land force was dispatched, April 27, 1805, to assist the deposed bashaw, Hamet Caramalli, in an attack upon the Tripolitan town of Derne, which was bombarded by the "Argus," "Nautilus," and "Hornet" from seaward, and at the same time attacked in the rear by the land forces under Consul-General Eaton and Lieut. O. Bannon. After a spirited resistance of one hour and a half the town surrendered, and was given in charge of the deposed bashaw, whose brother was the power at Tripoli. Of the assailing force only 14 were killed, and among the wounded was Gen. Eaton.

Following this, a demonstration was made against Tunis, and so well followed up by Commodore Rodgers (who had relieved Commodore Barron, May 26) that negotiations were much facilitated, and a treaty of peace followed, June 3, when all prisoners were surrendered and it was stipulated that no more tribute should be paid.

The squadron, which had increased to 20 vessels, including the 2 bombards "Etna" and "Vesuvius," and the ship "Wasp," 18, and brig "Hornet," 18, was gradually withdrawn from the Mediterranean.

The *gunboat* policy, which originated in 1803, was this year, March 2, revived by an act authorizing the President to have 25 built for the protection of the harbors of the country. These were increased to 50 by the act of April 21, 1806, and to 188 by the act of December 18, 1807. They were numbered as they were built or purchased; and of the first 9 sent to the Mediterranean in 1805, all but No. 7, though sailing from different ports of the United States, arrived in Syracuse within 28 hours of each other. No. 7, commanded by Lieut. Ogilvie, was lost at sea. No. 2 was armed with one long 32, and the remaining 8 with two long 32's. Of the other vessels of this class but very few performed valuable service on the coast. Some were lost and others condemned. At best they were only an auxiliary force, and never in favor with the officers of the navy.

From this period on to the war with Great Britain the navy was sadly neglected, and but for the appeals of the older officers, and the increasing depredations upon the commerce of the country, it was in a fair way of being forgotten.

The nation, although slow in her resentment, was not disposed to excuse continual encroachments upon her commerce, much less to condone the insult conveyed in the act of the commander of H. B. M. ship "Leopard," in firing into the U. S. S. "Chesapeake" on the coast, June 22, 1807. In consequence of this outrage all British vessels were ordered to leave the ports of the United States. War would seem to have been the proper remedy, but the country was ill prepared for this, and negotiations continued.

The embargo laid upon vessels (December 22) this year was repealed, and a non-intercourse act passed March 4, 1809.

At the close of this year it became painfully manifest that a crisis was approaching, for which the country was unprepared. A feeble effort was made to increase the *personnel* of the navy to about 7000 officers and men, and the frigates "United States," "President," "Essex," and "John Adams" were ordered to be equipped; the last named had been razeed to a sloop-of-war. June 24, 1810, H. B. M. ship "Moselle" fired into the U. S. brig "Vixen" near the Bahamas, and May 16, 1811, Commodore Rodgers, in the frigate "President," exchanged shots with H.B.M. ship "Little Belt," killing and wounding several of her crew. This was at night, and partly

accidental, but it showed a preparation for returning compliments, and an earnest of what was soon to follow—in the declaration of war against Great Britain, June 18, 1812.

And here I will leave to another the continuation of this record, commencing with the war with Great Britain, the principal actors in which have passed away; but the history of the navy in this crisis, and during subsequent events, may well challenge the criticism of the world.—*George F. Emmons, Rear-Admiral U.S.N.*

Navy of the United States from the Commencement of the War with Great Britain in 1812 to 1880.—From the commencement of the great wars between Napoleon and England and the Continental powers of Europe, our rights as a maritime nation had been frequently violated by the principal maritime belligerents, and England, by her course of conduct, had exasperated the national sentiment to such a degree that quiet submission to her pretensions and exactions became no longer possible. The injury to our commerce through her orders in council, the impressment of our seamen upon the high seas, the arrogant and oppressive conduct of her officers in asserting the right of search, together with the discovery of a plot on the part of English agents to sever the American Union, roused the indignation of the country, and led to a declaration of war by Congress against the king of Great Britain on the 18th of June, 1812.

At the breaking out of the war the navy of Great Britain contained 1060 sail, of which between 700 and 800 were efficient cruisers, and she possessed in her West India possessions and Bermuda and Halifax ports proximate to our coast for refitting her vessels of war and places of refuge for her prizes. The naval force of the United States consisted of 17 cruising-vessels, of which 9 were of a class less than frigates, and a number of gunboats of limited size and armament for the protection of our rivers, bays, and inlets. Under this great disparity in naval strength and with a vast extent of sea-coast, every port upon which was liable to blockade, the United States was about to engage in war with a nation who possessed a navy more powerful than all the rest of Christendom combined, and which had proven its invincibility upon the ocean. Under such conditions and disparity of means it was thought impossible to keep our cruisers at sea, and a project was entertained by the Cabinet of laying up all our vessels in ordinary to prevent their capture. Fortunately, at this time Capts. Bainbridge and Stewart were at the seat of government, and through their vigorous representations and remonstrances the Cabinet was induced to change its policy. Outside of the navy even its friends looked forward to the conflict with distrust, while the English officers —many of them veterans who had served with Nelson and England's famous captains, and had seen the flag of England always triumphant— felt a degree of confidence that begets success.

Upon the declaration of war the "President," 44, Commodore Rodgers; "Essex," 32, Capt. Porter; and "Hornet," 18, Capt. Lawrence, were in New York. These vessels, with the exception of the "Essex," which vessel was fitting for sea, were ready to sail. Commodore Rodgers, with the "President" and "Hornet," dropped into the bay, where he was joined by the "United States," 44, Commodore Decatur; "Congress," 38, Capt. Smith; and "Argus," 18, Lieut. Commandant Sinclair. Within an hour of the receipt of his orders and official information of the declaration of war Commodore Rodgers was under way, passing Sandy Hook with his squadron the afternoon of June 21. On the 23d, at 6 A.M., a vessel was seen to the northward and eastward, to which chase was given, and at half-past four the "President" opened with her chase-guns. The first hostile shot afloat, it is understood, was fired by Commodore Rodgers in person. This shot struck the chase in the rudder-coat and lodged in the wardroom. Several effective shots followed, but at the fourth discharge, fired from the first division below, the gun burst, killing and wounding 16 men, the commodore being thrown by the explosion into the air and breaking a leg by the fall. The forecastle deck was damaged, and through the accident firing was delayed for some time. This enabled the enemy to open with his stern-guns, one shot killing a midshipman of the "President" and 2 men. By lightening the enemy managed to escape. It was afterward known that the vessel chased was the "Belvidere," Capt. Byron. She arrived in Halifax a few days after, and carried with her the news of the declaration of war. The "President" had 22 men killed and wounded, 16 of whom were by the bursting of the gun. The "Belvidere" lost 7 killed and wounded by shot and several others by accidents, and she was materially injured in her spars, sails, and rigging. Capt. Byron was among the wounded. The injuries to the "President" were slight. On the 9th of July the "Hornet" captured an English letter of marque. Commodore Rodgers, after continuing his cruise until within a day's sail of the chops of the English Channel, stood to the southward, and, after passing Madeira, returned to Boston. Early in July an English squadron, of which Capt. Broke, of the "Shannon," was senior officer, appeared off New York and made several captures, the "Nautilus," 14, Lieut. Commandant Crane, being one of the number. She was captured, after all the resources of an accomplished officer were exhausted, by an overwhelming force. This was the first vessel of war taken by either side. After refitting on her return from Europe, the "Constitution" sailed from Annapolis on the 12th of July, and stood to the northward. Upon this cruise she was chased for three days by the English squadron, composed of the "Africa," 64, Capt. Bastard; "Shannon," 38, Capt. Broke; "Guerriere," 38, Capt. Dacres; "Belvidere," 36, Capt. Byron; and "Eolus," 32, Capt. Townsend, and only escaped capture through the most skillful seamanship of her commander and officers and the perfect discipline and obedience of her crew. The story of the chase is familiar to every reader of American naval history. Not a boat was stove nor an anchor or gun lost.

The "Essex," Capt. Porter, sailed from New York shortly after the departure of Commodore Rodgers, going to the southward. When a few weeks out she discovered a fleet of vessels consisting of a few transports under convoy of a frigate, one of which she made prize of, capturing about 150 soldiers in her. It was Capt. Porter's intention to make a dash at the convoying frigate, but day dawning before he could come up with

her, the attempt was given up; this vessel was said to be the "Minerva," 36. A few days after this success the "Essex" surprised and captured H. B. M. ship "Alert," Capt. Langhorne, mounting twenty 18-pounder carronades, and with a full crew. There was great disparity in the armament and size of the two vessels, but the resistance of the "Alert" was so feeble as to excite surprise. The "Essex" continued to cruise to the southward of the Grand Banks, and at one time was so hard pressed by the enemy's frigates that Capt. Porter determined as a last alternative to make the attempt to carry one of them by boarding in the night. The arrangements for this purpose were so complete as to give reason to think the plan would have been successful.

On the 2d of August, a short time after his famous escape from the English squadron, Capt. Hull sailed from Boston in the "Constitution," and on the 19th, at 2 P.M., lat. 41° 44′ N., lon. 55° 48′ W., a sail was made bearing E.S.E., and to leeward, to which chase was given. At 5 o'clock the chase hoisted three English ensigns, and immediately after opened fire at long range. At 6 o'clock the enemy bore up under his three topsails and jib, with the wind on his quarter; the "Constitution" immediately set her main topgallant-sail and foresail to get alongside. Shortly after the bows of the American frigate began to double on the quarter of the English ship, when the former opened with her forward guns, drawing slowly ahead, both vessels keeping up a close and heavy fire as their guns bore. Just as the ships were fairly side by side the mizzen-mast of the Englishman was shot away, when the American, ranging ahead, luffed short round on her bow to prevent being raked. In attempting this she fell foul of her antagonist, when both parties prepared to board. Both sides now suffered severely by the closeness of the musketry fire, Mr. Morris, the first lieutenant of the "Constitution," being shot through the body. It being impossible to board owing to the heavy sea, the sails were filled on the "Constitution," and as she shot ahead the fore- and mainmast of the enemy fell, leaving her a helpless wreck. Shortly after the enemy struck. She proved to be the "Guerriere," 38, Capt. Dacres, though actually carrying 40 guns,—one of the ships that had so lately chased the "Constitution" off New York. Mr. Charles Morris, the first lieutenant of the "Constitution," was promoted to a post-captain for his part in this brilliant achievement. The loss of the "Guerriere" was 79 killed and wounded; that of the "Constitution," 7 killed and 7 wounded.

Sunday, October 25, the "United States," 44, Commodore Decatur, then in lat. 24° N., lon. 29° 30′ W., captured, after a brief action, H. B. M. frigate "Macedonian," 38, Capt. Carden. On taking possession the enemy was found fearfully cut up, having received no less than 100 round shot in her hull alone. Of 300 men, 36 were killed and 68 wounded. The "Macedonian" was a fine ship, actually mounting 49 guns. The "United States" suffered comparatively little aloft, and but slightly in her hull. She lost 5 killed and 7 wounded. The style in which the "Macedonian" was captured added materially to Commodore Decatur's high reputation, his services were handsomely acknowledged, and Mr. Allen, his first lieutenant, was promoted. These brilliant successes changed the whole current of public opinion on the part of our people, and a feeling of just pride replaced that of despondency.

On the 17th of October, lat. 37° N., lon. 65° W., the "Wasp," 18, Capt. Jones, captured, after a spirited contest, H. B. M. brig "Frolic," 18, Capt. Whinyates. The "Wasp" had 5 men killed and 5 wounded. Capt. Whinyates, in his official report, states that not 20 of his entire crew escaped unharmed. Both vessels were nearly equally matched in size and armament, the advantage in the latter respect being with the English. The conduct, skill, and seamanship displayed in this conflict greatly increased the reputation of the American navy. Capt. Jones and Mr. James Biddle were both promoted, besides receiving other testimonials for their conspicuous gallantry. Both the "Wasp" and "Frolic" were shortly after captured by the "Poictiers," 74.

In lat. 13° 06′ N., lon. 31° W., the "Constitution," 44, Commodore Bainbridge, captured, after an hour's actual fighting, H. B. M. frigate "Java," 38, Capt. Lambert. Though rated at 38, as vessels of a similar class to the "Java" actually carried 49 guns, it is fair to presume this was the case with that vessel. In this combat, though the "Constitution" was a somewhat heavier vessel in all respects, in the difference in the execution of the fire of the two vessels there is a wide disparity. The "Constitution" lost 9 killed and 25 wounded, among the latter Commodore Bainbridge and the junior lieutenant, Mr. Alwyn, who died some time after of his injuries. The "Java," according to the statement of Commodore Bainbridge, lost 60 killed and 101 wounded,—Capt. Lambert mortally; one of her lieutenants, the master, and many of her inferior officers, were slain or seriously hurt. The "Constitution" went into action with her royal yards across, and came out with all in their places, and her injuries were slight. The "Java" lost her three masts and bowsprit, and her hull was greatly injured. No friendly port being at hand to refit the "Java," she was blown up.

On the 24th February, 1813, the "Hornet," 18, Capt. Lawrence, being then about 7 miles off the Demarara River, South America, encountered and, after an engagement of 15 minutes, captured H. B. M. ship "Peacock," 18, Capt. Peake. Shortly after she struck she went down with 3 of the "Hornet's" crew and 9 of her own. The "Hornet" lost 1 man killed and 4 wounded. The "Peacock" lost her captain and 4 men killed, and 33 wounded. The "Hornet" was not materially damaged. The fine handling of the "Hornet" and her superior gunnery quickly decided the day. Inspired by these brilliant successes, Congress empowered the President, in January, 1813, to build 4 ships to rate not less than 74 guns, and 6 frigates to rate 44 guns each; and on the 3d of March ensuing directed 6 sloops-of-war to be built on the sea-board, and as many vessels on the lakes as the public service required.

The space allowed for an article on the navy in a work of this character compels only a brief notice of the famous cruise of the "Essex," 32, Capt. Porter,—a cruise which for boldness of conception, fertility of resource, self-reliance, and indomitable energy and enterprise, is almost without a parallel in any navy. Cutting adrift

from all provided means of supplies, he struck boldly out for the Pacific, capturing and destroying the enemy's commerce wherever found, and for many months he continued, with his consort, the "Essex Jr." (a prize converted into a man-of-war), his work of destruction and depredation. Up to the time of the arrival of the two ships at Valparaiso, about the 1st of February, 1814, the cruise had been one of uninterrupted success, and a brilliant victory over a vessel of equal force alone was wanting to its completeness. Entertaining this sentiment, so characteristic of the officer and man, Capt. Porter concluded to remain in Valparaiso and wait for the arrival of H. B. M. frigate "Phœbe," 36, one of the ships fitted out expressly to search for him. In due time the "Phœbe" arrived, but not alone, being accompanied by the "Cherub," 20, Capt. Tucker. Various devices were resorted to by Capt. Porter to engage the "Phœbe" singly, but without avail. Finally, as he had reason to believe his vessel outsailed both the enemy's ships, he decided to go to sea, and drawing the enemy away from the port, give the "Essex Jr." a chance to escape. This intention was frustrated by the loss of his main topmast off Angel Point in a squall, which compelled his return. Unable to reach the harbor, he anchored about 3 miles from the town, within pistol-shot of the shore, where the Chilians had a small battery. Disregarding the neutrality of Chili and all neutral rights, he was attacked by both the "Phœbe" and "Cherub," and after a most determined and bloody resistance, and a display of unexampled heroism against overwhelming odds, in which his loss was 152 out of a complement of 255 men, he was obliged to yield. The loss of the enemy was 5 killed and 10 wounded, the first lieutenant of the "Phœbe" being among the former. The English ships were cut up more than could have been expected, the "Phœbe" having received, besides other injuries, 18 shot below the water-line. From the dauntless and determined spirit displayed on the part of the Americans in this conflict, it is more than probable the result would have been different had Capt. Porter been able to fight his ship under way. Mr. Gamble, of the marines, who commanded the "Andrew Hammond," another prize of Capt. Porter's converted into a cruiser, was with Capt. Porter's command during most of his memorable cruise. He and his command were, shortly after the loss of the "Essex," captured at the Sandwich Islands by the "Cherub."

The action between the "Chesapeake," 38, Capt. Lawrence, and the "Shannon," 38, Capt. Broke, which resulted in the capture of the former after a sanguinary struggle, occurred on the 1st of June, 1813, about 30 miles off Boston Sound. The capture of the "Chesapeake" is to be attributed to various causes. It is well known that the "Shannon" had been officered and manned with a picked crew with a view to engaging the "Chesapeake," and was in a high state of discipline. The officers of the "Chesapeake," on the contrary, were most of them young and inexperienced, and her first lieutenant, though an officer of merit, was new to his duties. Her crew was a mixed one, raw and disaffected, and composed of a large proportion of landsmen. Under these circumstances it is thought Capt. Lawrence should have declined the challenge of Capt. Broke until the ship and crew were in a better state of preparation. Capt. Lawrence was a man of the loftiest and most chivalrous spirit; and upon a previous occasion, while in command of the "Hornet," having sent a challenge to the captain of the "Bonne Citoyen," he felt it incumbent upon him to accept the gage of battle offered. Few battles have been more sanguinary. The "Chesapeake" lost 48 killed and 98 wounded, the "Shannon" had 23 killed and 56 wounded. On board the "Chesapeake" fell or died of their wounds Capt. Lawrence, Lieuts. Ludlow and Ballard, of the navy, and Broome, of the marines, Mr. White, the master, Mr. Adams, the boatswain, and 3 midshipmen. Mr. Budd, second, and Mr. Cox, third lieutenant, were also wounded. The "Shannon" lost her first lieutenant and one or two inferior officers, and Capt. Broke was badly wounded, the boatswain lost an arm, and one midshipman was wounded. Capt. Lawrence and Mr. Ludlow were both buried at Halifax with military honors.

On the 12th of July the brig "Siren," 14, was captured by the "Medway," 74, after a long chase.

Off Portland, Me., on the 4th September, 1813, the "Enterprise," 14, Lieut. Commandant Burrows, captured, after a heavy combat, H.B.M. brig "Boxer," 14, Capt. Blythe. In this engagement both the commanding officers were killed. Both vessels were fought gallantly. The damage to the American was comparatively slight, while the "Boxer" was badly cut up in her hull, spars, sails, and rigging, and had several guns dismounted. The "Boxer" had 14 men wounded and several men killed; the "Enterprise" 1 man killed and 13 wounded, of whom 3 subsequently died. Capts. Burrows and Blythe were both buried at Portland with military honors. This success was the first that had fallen to the American navy since the capture of the "Chesapeake," and its effect in restoring the confidence of the nation was very great.

In June, 1813, the brig "Rattlesnake," 16, Lieut. Commandant Renshaw, was captured by the British frigate "Leander," 50. After a daring and most successful cruise off the English coast, rivaling in audacity the exploits of Paul Jones, the "Argus," 18, Capt. Allen, was captured by H. B. M. brig "Pelican," 18, Capt. Maples, a greatly superior vessel in armament, the "Pelican" mounting 32-pounder carronades, while the "Argus" carried 24's. The "Argus," in an action lasting three-quarters of an hour, had 2 midshipmen and 4 men killed, and 17 wounded, among the latter Capt. Allen, who subsequently died in the hospital of Mill Prison, and was buried with the honors of war. The "Pelican" lost 7 in killed and wounded.

In June, 1813, the "Constellation" being blockaded near Norfolk by a large English force, several attempts were made to destroy or capture her by boats from the English fleet, all of which resulted in heavy loss to the enemy from the fire of the batteries on Craney Island, and that of our gunboats. In one of the minor conflicts with the enemy, Mr. Sigourney, a gallant and promising young officer, was killed, while defending, sword in hand, his command, the "Asp," then lying in the Yeocomico. She was finally carried by boarding by an overwhelming force, and set on fire and abandoned; but Mr. McClintock, the

officer second in command, upon the enemy retiring again, got on board and extinguished the flames.

About this time the frigates "United States" and "Macedonian" and sloop-of-war "Wasp," under Commodore Decatur, were chased into New London, where they were blockaded, and never again got to sea during the war, though every effort was made to elude the enemy.

For the defense of the bays, rivers, and inlets several small vessels had been fitted out, and among them the "Alligator." While this vessel was lying at anchor near Cole's Island, she was attacked by the enemy's boats. Mr. Bassett, her commander, cut her cables and made sail, and with the assistance of a light breeze, which enabled him to bring his vessel under control, succeeded in defeating the attempt of the enemy and inflicting upon him heavy loss. Mr. Bassett was promoted for his gallantry upon this occasion. The "Alligator" was subsequently capsized in a violent squall in Port Royal Sound, and many of her crew perished.

Among the gallant exploits of the war, those performed by Lieut. Lawrence Reamey are among the most conspicuous. In January, 1815, this officer, in command of 3 barges, captured, under the guns of the English frigate "Hebrus," a heavily-armed tender and launch belonging to that vessel, with 40 men, and a few days later, in the captured launch of the "Hebrus," with a crew of 25 men, he captured a tender belonging to the frigate "Severn," having on board between 30 and 40 men. No more dashing exploits occurred during the war.

In October, 1814, gunboat No. 160, commanded by Mr. Payne, while convoying a number of coasters from Savannah to St. Mary's, was captured by a tender and 10 armed boats after a spirited and obstinate resistance, in which half her crew were killed or wounded. The enemy suffered severely. Mr. Payne was badly wounded.

In July, 1813, gunboat No. 121, commanded by Mr. Shead, was captured by 8 armed boats from the "Innon," 38, and the "Martin," 16, after a persistent défense, in which the enemy lost 7 killed and 12 wounded. No. 121 had 7 men wounded.

During the summer of 1813 our government had but 3 vessels of war at sea,—the "President," 44, the "Congress," 38, and "Essex," 32. Within a year after the declaration of war all the brigs, with the exception of the "Enterprise," had been captured. The loss of these vessels induced a change of policy with the government, and it was decided to build sloops-of-war of a class sufficiently large to cope with anything beneath the small frigates of the enemy. In June, 1814, the "Guerriere," 44, was launched at Philadelphia, and on the 20th July following the "Independence," 74, was launched at Boston. The first two-decked ship that ever properly belonged to our navy—the "Java," 44—was soon after launched at Baltimore. Commodore Rodgers was appointed to the first-, Bainbridge to the second-, and Perry to the third-named vessels. The new sloops-of-war began to get to sea during the summer. The "Frolic," 18, was captured shortly after sailing by H. B. M. frigate "Orpheus," 36, without resistance, as during the chase her guns were thrown overboard. The "Adams," 28, had been cut down at Washington to a sloop-of-war, and lengthened so as to carry 28 guns on a single deck. Under the command of Capt. Morris she succeeded in getting to sea, and after several narrow escapes and an extended cruise, in which she made many captures, she was obliged, on account of damages by grounding, to go into the Penobscot River for repairs, going as far up as Hampden. While the vessel lay ready to be hove out, and with nothing in her, she was attacked by a strong force of the enemy, consisting of troops and vessels of war, and to prevent her capture she was destroyed, the crew all escaping and reaching Portland but 1 man and 1 marine, who fell into the enemy's hands.

On the 28th June, 1814, the "Wasp," 18, Capt. Blakeley, one of the new sloops-of-war, in lat. 48° 36′ N., lon. 11° 15′ W., captured H. B. M. sloop-of-war "Reindeer," Capt. Manners. On the part of the enemy this fight lasted 28 minutes, on that of the "Wasp," 19 minutes. It is conceded the English captain fought his ship with great skill and gallantry. In attempting to board he was mortally wounded. The coolness, skill, and seamanship displayed by Capt. Blakeley during every phase of this conflict has never been surpassed. The "Reindeer" was cut to pieces in a line with her ports. The "Wasp" was hulled 6 times, and she was pitted with grape. She had 5 killed and 22 wounded, among the latter 2 midshipmen, who subsequently died of their wounds. The "Reindeer" lost 25 killed and 42 wounded, her first lieutenant and master among the latter. The prize was destroyed to prevent recapture. On the 1st of September, 1814, Capt. Blakeley, in the same vessel, being then in lat. 47° 30′ N., lon. 11° W., engaged and sunk the "Avon," 18, Capt. Arbuthnot, within sight of her consort, the "Castilian," 18, and two other vessels, one of them known to be a man-of-war. After the engagement, Capt. Blakeley ran off dead before the wind in order to reeve new braces and to draw the nearest vessel from her consort. This vessel, the "Castilian," 18, continued the chase, but after firing a broadside into the "Wasp," hauled her wind to rejoin her sinking consort, who was making signals of distress. The "Avon" is supposed to have lost from 30 to 50 in killed and wounded. The "Wasp" lost 1 killed and 2 wounded. Capt. Blakeley's conduct in the destruction of the "Avon," and his ready preparation to engage the "Castilian" after the destruction of the "Avon," indicate the splendid character and spirit of the man and the school in which he was trained. The last heard of the "Wasp" and her glorious commander was in a letter brought to Savannah on the 4th of November, 1814, in a prize called the "Atlanta," commanded by Lieut. Geisinger. Various conjectures have been formed as to her fate, but it is generally believed she foundered in a gale. Lieut. McKnight, late of the "Essex," and Master's Mate Lyman, passengers, were also lost in her.

In lat. 27° 47′ N., lon. 80° 09′ W., the "Peacock," 18, Capt. Warrington, on the 29th April, 1814, engaged and captured after an engagement of 45 minutes H. B. M. brig "Epervier," 18, Capt. Wales. The loss of the latter was 22 killed and wounded, and at the close of the engagement she had 5 feet of water in her hold,

and in her spars and rigging was extensively injured. The "Peacock" had but 2 men wounded, and her injuries were slight. The prize was put under the charge of Mr. J. B. Nicholson, the first lieutenant of the "Peacock," who, after several critical escapes from the enemy, carried her safely into Savannah. The establishment of peace in Europe, owing to the downfall of Napoleon, enabled England to employ a largely increased force in the prosecution of the war against the United States and in carrying out her policy, which seemed to be twofold,—that of conquest and the infliction of injuries of a partisan character. To meet the operations of the enemy the U. S. government had equipped a force in the Chesapeake under the command of Capt. Joshua Barney. This force consisted principally of barges carrying heavy guns, a few galleys, and one or two schooners. With this force Commodore Barney distinguished himself in defeating the plans and attacks of the enemy, and upon every occasion displayed the highest and best qualities of the officer, notably in the Patuxent, where he resisted successfully the heavy attacks of the enemy, in one of which the "Severn," frigate, or the "Loire," was seriously injured, and in opposing at Bladensburg the march of the enemy upon Washington, where Barney and his flotilla-men, who had left the flotilla to co-operate with the army, sustained a large share of the fighting. Upon this occasion the flotilla in the Patuxent was destroyed to prevent falling into the enemy's hands. With the capture of Washington, for a similar reason, the "Columbia," 44, on the stocks, was destroyed, the "Boston," 28, and the "Argus," 18, beside quite an amount of naval stores. The seamen and marines of the "Guerriere," "Java," and flotilla, under command of Commodore Rodgers, assisted materially in resisting the advance of the enemy upon Baltimore, and in the battle of North Point were conspicuous for valuable service. In the attacks also upon Fort McHenry, the warm and well-directed fire from Fort Covington, manned by men from the "Guerriere," and commanded by Mr. Newcomb, and of Fort Babcock, manned by 50 men from the flotilla under charge of Sailing-Master Webster, together with that of the barges under Lieut. Rutter, assisted materially in the repulse of the enemy. All of these gentlemen were distinguished by their steadiness and efficiency. The complete failure of the enemy in these attacks terminated active operations in the Chesapeake.

In December, 1814, Vice-Admiral Cockburn suddenly appeared off the mouth of the Mississippi, with the intention of making a formidable attempt against New Orleans. Mr. Thomas Ap Catesby Jones with a division of 5 gunboats guarded the entrance of Lake Borgne, one of the approaches to the city. On the 14th of December, 1814, he was attacked by an overwhelming force, consisting of 40 or 50 barges, mounting 42 guns, principally 12-, 18-, 24-pounder carronades, manned by 1200 men, and after a persistent and heroic defense on the part of all engaged, he was forced to yield. Our loss was comparatively light, while the loss of the enemy in killed and wounded is supposed to have reached between 200 and 300, which exceeded the number of the Americans engaged. Lieut. Jones was badly wounded. Mr. McKeever, in No. 23, was the last vessel taken, after a most gallant defense. The country, while regretting so important a loss, looked upon the result against hopeless odds as a triumph.

Capt. Daniel T. Patterson commanded the naval force at New Orleans, and after the capture of the gunboats he had but two vessels remaining,—the "Louisiana," 16, and the "Carolina," 14. The latter vessel rendered signal service, under Capt. Patterson, in assisting Gen. Jackson by threatening the enemy's left flank, and by her galling fire to resist, by a spirited night attack, the first demonstration of the enemy, under Maj.-Gen. Keane, upon New Orleans. Shortly after this vessel, under command of Capt. Henley, was destroyed by the fire of a battery of heavy guns. In this affair 7 men were killed and wounded. All but these escaped, and volunteered to man some of the heavy guns mounted on the American lines, and rendered valuable service in all the subsequent successes under Gen. Jackson in his memorable defense of New Orleans. The "Louisiana" alone remained to co-operate with the army, and in the great battle of the 8th January her services, under Capt. Patterson, were of eminent value. Capt. Patterson also erected a battery on the right bank of the river, which he placed in charge of Capt. Henley, and which rendered important service. Upon the retreat of the enemy, several expeditions in boats were dispatched by Capt. Patterson to harass and cut off the enemy, and Mr. Thomas Shields, a purser, with 6 boats and 50 men, captured one of the enemy's large boats with 40 officers and men belonging to the dragoons and 14 seamen, and immediately after captured a barge, a transport schooner, and 5 other boats, with 83 more prisoners. Sailing-Master Johnson also performed creditable service in destroying a transport and capturing a number of men. In all the important service connected with the defense of New Orleans the navy bore a conspicuous part. Capts. Patterson and Henley, Lieuts. Jones, Thompson, McKeever, Spedden, Cunningham, Norris, and Crowley, with other junior officers, were distinguished for gallant conduct and services. The spirited conduct and gallant exploits of Purser Shields have been before mentioned. The marines under Major McCormick, who was wounded in resisting an advance of the enemy upon the American lines on the 20th of December, bore their share in the glories of this brilliant and decisive campaign.

Upon the commencement of hostilities, the American government caused the "Oneida," 16, to be built on Lake Ontario, where the English had long maintained a small force. Shortly after the English built the "Royal George," a vessel designed to carry 22 guns. On the 29th July, 1812, Lieut. Commanding Woolsey, in command of the "Oneida," then lying at Sackett's Harbor, successfully resisted an attempt to capture this vessel, made by a squadron composed of the "Royal George," 22, "Prince Regent," 16, "Earl of Moira," 14, "Duke of Gloucester," "Seneca," and "Simcoes." This was the commencement of hostilities on the great lakes,—ere the conclusion of the war to become the theatre of grand events. In August, 1812, Commodore Isaac Chauncey was ordered to this important command. With characteristic energy, judgment, and enterprise, under the authority of the

government, he immediately adopted prompt measures to increase our force to an extent commensurate with that of the enemy on Lake Ontario. Several vessels were immediately bought, armed, and equipped, and put in service, and called the "Hamilton," "Governor Tompkins," "Conquest," "Growler," "Julia," and "Pert." Their armament consisted of long guns, mounted on circles, with a few light guns, averaging about 4 guns each. The keel of a ship to carry twenty-four 32-pounder carronades was laid in September. With the "Oneida," the entire flotilla mounted 40 guns, manned by 430 men, including marines. At this time the force of the enemy was more than double that of the Americans in guns and men, and, as cruisers, were greatly superior. On the upper lakes the enemy had two or three vessels, which, for the time, gave them control of those waters before the arrival of Commodore Chauncey at Sackett's Harbor. Lieut. I. D. Elliott was ordered to the upper lakes to purchase suitable vessels for the creation of a suitable force in those waters. On his way in the execution of these orders, learning that the first detachment of seamen for service on the lakes was within a short distance of the Niagara frontier, and that the "Detroit" and "Caledonia," armed vessels of the enemy, were anchored under Fort Erie, he organized, in connection with Capt. Towson, of the army, an expedition for their capture. Beside the officers named, Sailing-Master Watts, of the navy, and Lieuts. Roach and Pressman, of the army, participated. The success was complete, and resulted in the capture of both vessels. The "Caledonia" was brought to the American side. The "Detroit" having grounded on Squaw Island, within reach of the guns of Fort Erie, she was burned by the Americans after removing most of her stores. The enterprise was full of daring, and was the first success on either side in the warfare on the lakes. Congress voted Mr. Elliott a sword, and Capt. Towson acquired great reputation for his part in the enterprise; to his unflinching courage and skill the capture of the "Caledonia" is materially due, while all participating in the glowing achievement deserved and received high praise. Soon after the arrival of Mr. Angus, who was senior to Elliott, the latter rejoined Commodore Chauncey's command. On the 8th November, Commodore Chauncey hoisted his broad-pennant on the "Oneida," 16, Lieut. Commandant Woolsey, and having the rest of his flotilla in company, sailed to cut off the enemy's vessels. Upon this occasion the "Royal George," having sought protection under the forts at Kingston, a spirited engagement between the flotilla and forts followed, but, owing to the coming on of a gale, without material results, and the vessels, on the 10th, returned to Sackett's Harbor. Commodore Chauncey, in the "Oneida," used every possible means to bring on an engagement with the "Royal George," a much heavier vessel, but without success. Brig.-Gen. Smythe, towards the close of November, preparatory to a descent on the Canada shore, requested the co-operation of Mr. Angus, with a naval force, in driving the enemy from the batteries on the Canada side. The night of the 28th November was selected for the occasion. The expedition was divided into two parties, one consisting of 10 boats and 70 seamen, exclusive of officers, under Mr. Angus, accompanied by Capt. King, with a detachment of 150 soldiers, and Mr. Samuel Swartout, of New York, as a volunteer. The other, with 10 more boats and a detachment of 200 strong, was commanded by Col. Boerstler. The arrangements being completed, the expedition left the American shore about 1 A.M. The plan was for one party to ascend the river while the other descended with the current. Upon nearing the shore, the enemy, who were prepared, opened a destructive fire; but the boats, commanded by efficient officers, dashed in and effected a landing. A body of the enemy was drawn up in front of the barracks, known as the Red House, their left flank protected by two guns. As soon as the troops formed the fire was returned.

At this juncture a few seamen armed with pistols and pikes, led by Sailing-Master Watts and Midshipman Holdup Stevens, made a detour around the hill, and charging the artillerists, captured the guns in the most gallant manner, mortally wounding Lieut. King, who commanded them; the remaining troops and seamen charged in front, when the enemy fled to his barracks, where his fire becoming very destructive, it became indispensable to dislodge him. Several spirited young midshipmen, Messrs. Wragg, Dudley, and Holdup Stevens,—neither of whom were yet twenty,—with a few men succeeded in bursting open a window in the barracks, through which an entrance was made, and unbarred an outer door, when Mr. Angus and the seamen rushed in and drove the enemy out. Some confusion here followed, owing to an order to retreat by some irresponsible person, and a portion of the soldiers and seamen embarked. Mr. Angus attempting in vain to stop the retreat, retired with his men. Capt. King, however, with a part of his troops, still remained engaged, and with him a few seamen, with Messrs. Wragg, Dudley, and Stevens at their head. A charge being ordered, the enemy again broke, and fled into a battery; he was driven from place to place until completely routed and all the batteries at that point were captured. The young sea-officers who remained, believing their part of the work accomplished, crossed to the American side in the best manner they could, Messrs. Dudley, Wragg, and Stevens crossing with some wounded men in a leaky canoe, which sunk twice before they reached our shore. The fighting was of the most desperate character, and the impression made by the seamen with their pikes was long remembered. Their loss was equal to their gallantry. Of 12 sea-officers engaged, 8 were wounded, Sailing-Masters Sisson and Watts mortally. Mr. Carter, another master, was wounded; Midshipman Wragg was wounded in the abdomen, Midshipman Graham lost a leg, Midshipman Holdup Stevens received a wound which shattered his hand, Mr. Brailesford was wounded in the leg, and Mr. Mervine received a ball in the side. Most of the seamen who were not killed got back to the American side. Our entire loss on the part of the navy was 30 in killed and wounded, which was quite half of all who landed. Capt. King and several army officers, with about 60 men, having no means of retreat, eventually fell into the enemy's hands. The troops behaved gallantly, and Capt. King was conspicuously dis-

tinguished. Many of the officers were wounded. The enemy was effectually beaten,—batteries carried, barracks burned, guns spiked, and caissons destroyed.

On April 25, 1813, the American squadron, under Commodore Chauncey, consisting of the flag-ship "Madison," Lieut. Commandant Elliott; "Oneida," Lieut. Commandant Woolsey; "Fair American," Lieut. Chauncey; "Hamilton," Lieut. McPherson; "Governor Tompkins," Lieut. Brown; "Conquest," Mr. Wallaby; "Asp," Lieut. Smith; "Pert," Lieut. Adams; "Julia," Mr. Trant; "Growler," Mr. Mix; "Ontario," Mr. Stevens; "Scourge," Mr. Osgood; "Lady of the Lake," Mr. Flinn; and "Raven," transport, having on board a body of 1700 men, under Gen. Pike, appeared off York. All the vessels ran within a mile of the shore to the southward and westward of the principal fort. Two hours after the troops under Gen. Pike were disembarked, and, under cover of a fire of grape from the vessels, a successful landing was effected, with a loss to the army of about 40 men. As soon as Gen. Pike with his command moved to the assault, the small vessels worked up to within 600 yards of the principal fort, when they opened fire upon the enemy, and contributed largely to the success of the day. Commodore Chauncey directed in person the naval operations, pulling in his gig through the enemy's fire, encouraging all by his coolness and conduct. After sustaining some loss by an explosion, which killed Gen. Pike, the place capitulated, and remained in our hands until the 1st of May. The loss to the navy was 14 men killed and wounded. The "Duke of Gloucester," undergoing repairs, fell into our hands, a 20-gun vessel was burned, a number of boats for transportation of troops were taken, and a large amount of naval and military stores were destroyed, after sending a considerable amount to Sackett's Harbor. The navy contributed largely to the success, and the different vessels were well handled.

On May 27, 1813, a combined army and navy demonstration was made against Fort George, resulting in its capture. Upon this occasion Capt. Perry, who was second in command, attended to the disembarkation of the troops. The marines of the squadron were embodied with the regiment of Col. Macomb. The arrangements for landing being completed, under cover of the fleet the boats under Capt. Perry dashed in, and Col. Scott effected a landing, though opposed by a concealed party, who advanced to repel the boats, which was driven back by the grape and canister of the vessels and the steady fire of our troops. When Scott landed the success of the day was assured. He was supported by the remainder of the brigade under Gen. Boyd, and after a short conflict the enemy was driven from the field and retreated towards Queenston. Upon this occasion Lieut. Brown, in the "Governor Tompkins," was highly commended for the handsome manner in which he brought his ship into action, and the splendid execution of his fire. The skill and service of Commodore Chauncey upon this occasion were handsomely recognized by the army and by Gen. Dearborn, the commander-in-chief. Commodore Chauncey commended all acting under him, and made special mention of Capt. Perry and Lieut. McPherson. Lieut. Brown was not named in the despatches, the omission doubtless being an accident; no officer was more distinguished. After the occupation of Fort George the British evacuated the whole Niagara frontier. Capt. Perry was shortly after sent to Erie to superintend the fitting out of the squadron at that place.

About the same time as the descent on Fort George, Sir Geo. Prevost, the British commander-in-chief, and Commodore Sir I. L. Yeo, planned a *coup de main* against Sackett's Harbor in retaliation for the blow they had received at York, and to destroy the new ship building there. The expedition was a failure as regarded its main objects, but owing to false information conveyed to the officer in charge of the store-house most of the stores captured at York, with quite an amount from the sea-board, were destroyed. Every effort was made on the part of Commodore Chauncey to get the new ship afloat, and on June 12 she was launched and placed in command of Capt. Sinclair. She was named the "General Pike." At this time many promotions occurred in the navy: Sinclair was posted, Woolsey, Trenchard, and Elliott made master commandants, and Holdup Stevens, Dudley, Packett, Yarnall, Wragg, Adams, Pearce, Edwards, Ives, Conklin, and Smith were raised to the rank of lieutenants.

Towards the close of the season Capt. Thomas McDonough was sent to assume command on Lake Champlain. In the spring of 1813 our force on that lake consisted of the "President," "Growler," and "Eagle." The two last were shortly after captured by the enemy after a stubborn resistance, and transferred to the British flotilla. In August the enemy appeared off Burlington, and succeeded in destroying some stores and in capturing several small trading-craft. Capt. McDonough now commenced building and purchasing vessels to secure again the command of the lake. In June, Lieut. Chauncey, in the "Lady of the Lake," captured on Lake Ontario a schooner loaded with provisions and ammunition. On June 30, Col. Scott embarked in the vessels of the squadron, landed at York without opposition, and seized a quantity of provisions and ordnance stores, and 5 cannon; 11 boats, built to transport troops, were destroyed.

In the early part of August the squadron sailed from the mouth of the Niagara in pursuit of the English squadron, Commodore Chauncey doing his utmost to bring on an engagement. On the night of the 7th the "Hamilton" and "Scourge" capsized in a squall, and only 16 of the crew of both vessels were saved. On the 10th, while the squadrons were manœuvring for the weather-gauge, the "Growler," Lieut. Deacon, and the "Julia," Mr. Trant, became separated from the rest of the squadron, and were captured after a dashing attempt to run the gauntlet of the English vessels. On the 28th September an engagement occurred between the two squadrons, which resulted in the discomfiture of the English and in chasing them into Burlington Bay. The English flag-ship, in the engagement, lost main and mizzen topmast and main yard, and was only saved from capture by flight and the gallant interposition of the "Royal George," Capt. Mulcaster. It is thought if Sir James Yeo had not borne up when he did, and waited long enough for the carronades of the "Madison" and "Oneida" to reach, his entire force would have

been captured or destroyed. A storm coming on, and for other weighty considerations, Commodore Chauncey was prevented from attacking the English in Burlington Bay. In this affair the late Capt. W. C. Boltin was prominent for the gallant and effective manner in which he handled the "Madison." The "Pike" having for some time borne the brunt of the fight, was a good deal cut up in her hull, spars, and rigging, and by the bursting of her bow-gun 22 men were slain or wounded. On the part of the enemy the "Wolfe" and "Royal George" suffered most,—the former sustained a heavy loss in men. Upon the abatement of the weather on the 29th, Commodore Chauncey, still in pursuit, chased the English squadron again into Burlington Bay. Every precaution was taken to prevent his escape in the thick weather prevailing. Upon the weather clearing a trusty officer was sent in to reconnoitre, who reported nothing was to be seen of the squadron. Commodore Chauncey then ran off the Ducks. It was known afterward that the English fleet had not left Burlington Bay. But for this mistake the English fleet would have been taken, as this end of the lake being near the weather shore our vessels could have safely attacked. At 3 P.M. on the 5th October seven sail were seen ahead, and chase was made; the strangers now set fire to one of their vessels, the others vainly attempting to escape. At sunset, opposite the Real Ducks, the "Confiance," "Hamilton," and "Mary" struck to the "Pike." The "Sylph" captured the "Drummond" cutter, and the "Lady Gore." The other vessel, the "Enterprise," escaped. The prizes were gun-vessels, mounting from one to three guns each, and were used as transports. Two hundred and sixty-four prisoners were taken, including some officers belonging to an English regiment. The "Confiance" and "Hamilton" were the schooners "Growler" and "Julia," taken from us on the night of the 8th August. For the rest of the season Commodore Chauncey was co-operating with the army and in watching the enemy off Kingston. The success of the naval operations for the season was largely with the Americans. The hostile squadrons were three times engaged,—twice the enemy avoided the conflict, and on the third occasion Commodore Chauncey attacked so vigorously with an inferior force as to leave no doubt of the result had not the English vessels put before the wind. The success at York and the fall of St. George, which depended entirely upon the co-operation of the navy, and the captures recently alluded to, were all important results,—rarely or ever before had English officers declined a combat with an inferior force. The more our naval operations on Lake Ontario are studied, the more conspicuous, brilliant, and successful will the services and splendid qualities of Commodore Chauncey appear.

By extraordinary exertions Capt. O. H. Perry, who had been ordered to the command on Lake Erie, assisted materially by Sailing-Master Dobbins, had succeeded, by purchase and building, in organizing at Erie a force of vessels, consisting of the "Lawrence," 20, "Niagara," 20, "Caledonia," 3, "Ariel," 4, "Trippe," 1, "Somers," 2, "Scorpion," 2, "Ohio," 1, and "Porcupine," and on the 4th of August, 1813, by the use of camels, floated the heavy vessels over the 7-foot bar lying at the entrance to the harbor of Erie and anchored outside. At this time the force of the enemy consisted of the flag-ship "Detroit," 19, the "Queen Charlotte," 17, the "Lady Prevost," 13, the "Hunter," 10, and three or four light cruisers, all under command of Capt. Barclay. On the 5th September, Capt. Perry sailed with his squadron in quest of the enemy, and after cruising several days anchored, on account of the illness of Capt. Perry, in Put-in-Bay. On the morning of the 10th, while still at anchor there, the enemy's squadron was discovered bearing N.W., when a signal was made to get under way. The wind was light at S.W., but shortly after changed to S.E., which placed the Americans to windward. About 10 o'clock the enemy hove to in line ahead, heading S.W., and distant about 3 leagues. When within about a league of the enemy, discovering how the enemy had formed, Capt. Perry communicated his order of attack. The English commander had formed his line with the "Chippeway," Mr. Campbell, armed with one pivot-gun, in the van; the "Detroit," his own vessel, next; the "Hunter," Lieut. Bignall; "Queen Charlotte," Capt. Finnis; "Lady Prevost," Lieut. Commandant Buchan; and "Little Belt," astern, in order named. To oppose this the "Ariel," Lieut. Packett, four long 12's, was placed in the van; the "Scorpion," Mr. Champlin, one long and one short pivot-gun, next; then the "Lawrence," Capt. Perry; the "Caledonia," Lieut. Turner, next astern; the "Niagara," Capt. Elliott, followed by the "Tigress," Lieut. Conklin; the "Somers," Mr. Almy; "Porcupine," Mr. Sennalt; and "Trippe," Lieut. Holdup Stevens, in order named, prescribed distance being half a cable's length.

From the commencement of the battle, shortly after meridian, and for two hours, the fire of the enemy was mainly directed against the "Lawrence," her only support being the two schooners ahead, which were gallantly fought. The cannonade had deadened the wind, and during this time there was little air. The "Queen Charlotte" having filled passed the "Hunter," and concentrated her fire with that of the "Detroit," upon Perry's flag-ship, producing great slaughter on board and almost dismantling her. After the firing had continued some time, the "Niagara" hailed the "Caledonia" and ordered her to make room for the former to pass ahead. Mr. Turner immediately bore down upon the enemy, and took up a position closer to his line than any other vessel. At the end of 2½ hours, the enemy having filled and the wind increasing, the two squadrons drew slowly ahead, leaving the "Lawrence" partially out of the fight. At this time the "Niagara" passed to windward of the "Lawrence," steering for the head of the enemy's line, the "Caledonia" falling to leeward. The vessels astern had not been idle, but, by dint of great efforts, had gradually been closing, though not in regular order. The rear of the line seems to have inclined toward the enemy, bringing the "Trippe," Lieut. Holdup Stevens, so near Turner's vessel, the "Caledonia," that the latter had sent a boat to her for a supply of cartridges. Capt. Perry, finding the "Lawrence" thoroughly disabled and dropping out of the combat, got into his gig and pulled for the "Niagara," which vessel

he boarded at half-past two. Soon after the "Lawrence," then a wreck and with hardly a man uninjured aboard, hauled down her colors. After a short consultation between Perry and Elliott, the latter volunteered to go in Perry's boat and order the smaller vessels, already hotly engaged, into closer action, within half-pistol distance of the enemy; this accomplished, Capt. Elliott remained on board and took charge of the "Somers." According to the statement of several of Perry's captains, up to the time Perry arrived on board the "Niagara" and took command of her that vessel had taken but a slight part in the conflict, and was almost uninjured. When the "Lawrence" lowered her colors, the enemy, supposing they had won the day, cheered lustily, and for a few minutes there was a general cessation of firing, both parties preparing for the final struggle. The wind had freshened, enabling the gunboats to close rapidly. At 45 minutes past 2 the "Niagara," then to windward of the leading vessels of the enemy, made signal for close action (which order was received with cheers and obeyed with alacrity), and bore up immediately under foresail, topsails, and topgallant-sail. The enemy observing this, attempted to wear to get fresh broadsides to bear, but in doing so his two ships for a time got foul, throwing his whole line into confusion and bringing the "Lady Prevost" to westward and leeward of the "Detroit." At this juncture the "Niagara" bore steadily down upon the enemy, passing between the "Chippeway" and "Lady Prevost" on the one hand and the "Detroit," "Queen Charlotte," and "Hunter" on the other, and, pouring in both broadsides as she passed, ranged ahead of the ships, and luffing athwart their bows, continued delivering a close, deadly, and raking fire. Simultaneously the "Caledonia," with the gun-vessels, was throwing in at close quarters a raking fire of grape and canister, and 15 or 20 minutes from the time the "Niagara" bore up a hail was passed among the small vessels that the enemy had struck. When the smoke of battle cleared the two squadrons were found partly intermingled; the "Niagara" lay to leeward of the "Detroit," "Queen Charlotte," and "Hunter," and the "Caledonia," with the "Trippe" and another gun-vessel, were between the "Hunter" and "Lady Prevost," while the "Lawrence," with her colors again flying, was astern. The "Little Belt" and "Chippewa" attempting to escape, were chased and captured about an hour after by Champlin in the "Scorpion," and Holdup Stevens in the "Trippe." The opposing squadrons suffered equally in killed and wounded. The "Lawrence" was cut up to a degree almost unparalleled in naval warfare; of her crew, 22 were killed and 61 wounded. When Perry left for the "Niagara" hardly a sound man remained on board. The "Niagara" had 2 killed and 25 wounded. The "Caledonia," Lieut. Turner, though carried into the thickest of the fight and entirely without quarters, had but 3 men wounded. The "Trippe," Lieut. Holdup Stevens, which for some time was as hotly engaged, and was equally without quarters, had 2 men wounded; the "Somers," Mr. Almy, the same; the "Ariel," Lieut. Packett, 1 man killed and 3 wounded; the "Scorpion," Mr. Champlin, 2 killed, one being a midshipman; the others had no one hurt. More than a hundred men of Perry's fleet previously to the action were unfit for duty, and Perry himself, when he met the enemy, was suffering from the effects of sickness, which greatly enhanced the value of his great services and heroic exploits. On the part of the Americans, Lieut. Brooks, commanding the marines, and Midshipmen Clark and Lamb, were killed, and Lieuts. Yarnall and Forrest, Mr. Taylor, the master, Mr. Hambleton, the purser, and Midshipmen Swartout and Claxton, all of the "Lawrence," were wounded. Mr. Edwards, second lieutenant of the "Niagara," and Midshipman Cummings were also wounded. The loss of the English was 41 killed and 94 wounded. The "Detroit" had her first lieutenant killed, and Capt. Barclay and the purser were wounded. Capt. Finnis, of the "Queen Charlotte," was slain and her first lieutenant wounded. The commanding officer of the "Lady Prevost," with the first lieutenant and commanding officer of the "Chippewa," were also wounded. Whatever may have been said and written of the superiority of the Americans in guns and weight of metal over the English in the commencement of the conflict, it must be conceded this advantage was more than offset by the complete disability of the "Lawrence," which ceased to be in the supreme crisis of the fight a factor, and that the complete success of this great and glorious achievement, when defeat seemed inevitable, is due greatly to the unconquerable will and daring spirit of the American commander-in-chief, when he, seizing the opportune moment, bore gallantly down upon the enemy, and, in breaking his lines, shattered his ships by his broadsides and achieved victory and immortal renown. Congress voted to Perry and Elliott each a gold medal, to the commanding officers a silver medal, and to the others a sword; prize-money was given to all. The results of the victory were of the first importance. The English evacuated Detroit, and Perry soon after reached that place in the "Ariel," and, in conjunction with the army, took possession. Perry co-operated with Harrison in his movements against the enemy, and was present with the latter in the battle of the Thames. Most of the upper part of the province fell under our control, and large quantities of military stores were captured.

On the 23d of October, Perry with his squadron transported Harrison's army to Buffalo, where he resigned his command to Elliott, having been promoted to a captain and ordered to command the "Java," 44, then at Baltimore.

Upon Lake Ontario the energetic and indefatigable Commodore Chauncey vied with the English in increasing his force, and in the spring of 1814 the keels of several sizable vessels were laid down by the Americans, and on the 2d of May the "Superior," 50, was launched.

In the early part of May, Sir James Yeo, with Lieut.-Gen. Drummond, having a force of from 1200 to 1800 men, made a descent upon Oswego, and captured a small quantity of stores. The defense, though hopeless, was obstinate. The Americans lost in killed, wounded, and missing 79 men. Lieut. Pearce, of the navy, took part in the defense and fought bravely. The "Growler" was sunk, but was raised and carried off by the enemy, who admitted a loss of 95 men. About the middle of June, Commodore Chauncey sent

Acting Lieut. F. H. Gregory with 3 gigs into the St. Lawrence, where the enemy had a line of gunboats stationed to protect his communications. Mr. Gregory lay in ambush on one of the islands, where he was discovered, and a gunboat sent in chase. Instead of retiring, Mr. Gregory made a dash at the vessel, and carried her without loss. She was armed with an 18-pounder carronade, having a crew of 18 men. While proceeding up the river he was again chased by a much larger gunboat, carrying 2 guns, which compelled him to scuttle and abandon his prize. Two days later Mr. Gregory, accompanied by two gallant lake seamen, Messrs. Vaughan and Dixon, destroyed at Presque Isle a cruiser nearly ready to launch, intended to carry 14 guns. Mr. Gregory was promoted for these gallant exploits. Subsequently this brave officer, while reconnoitring off Kingston in a gig, was pursued by 2 barges of the enemy, carrying 20 men, and after sustaining the loss of Midshipman White, who was killed, and having 5 out of a crew of 8 wounded, was compelled to surrender.

During the season no encounter occurred between the hostile squadrons, ours being employed in watching, blockading, and harassing the enemy, and in transporting troops and stores for the army operating on the frontier. On the 19th of November, Midshipman McGowan, accompanied by Mr. Johnson, a famous partisan, attempted to blow up the "St. Lawrence," 120, recently built and supposed to be at Kingston; being discovered, 2 boats were sent in pursuit, which he captured, with as many men as his own crew numbered, when, learning that the "St. Lawrence" was not in Kingston, he returned to Sackett's Harbor.

To counteract and oppose the movements of the enemy, who contemplated, it was thought, a descent upon Northeastern New York, the command of Lake Champlain, flanking as it did for 200 miles the march of an invading army, became of the first importance. With this object both parties during the spring of 1814 were actively engaged in building and equipping vessels and gunboats. About the middle of May, while the American squadron lay in Otter Creek, a force under Capt. Pring, consisting of the brig "Linnet" and 8 or 10 galleys, made an ineffectual attempt to fill up the channel with vessels loaded with stones. On the 3d of September, Commodore McDonough anchored his squadron off Plattsburg, the point selected for defense, on the flank of our troops intrenched there. About this time Sir George Prevost, with an army of 12,000 men, advanced against Plattsburg, then held by Gen. Macomb, with a force of about 1200 effective men. Commodore McDonough selected an anchorage a little to the southward of the mouth of the Saranac, with his vessels in line parallel to the shore, running north and south, and distant from the western shore 2 miles. The "Eagle," 20, Capt. Henley, lay at the northern extremity of the American line; the "Saratoga," 26, McDonough's flag-ship, second; the "Ticonderoga," 17, Lieut. Commandant Cassin, third; the "Preble," 7, Lieut. Charles Budd. The last vessel was anchored near the shoal to prevent the enemy passing that end of the line. The Americans had also 6 large and 4 small gunboats, each of the former carrying a long 24 and an 18-pounder columbiad, and each of the latter one long 12. The American force consisted of 14 vessels in all, mounting 86 guns, with a total complement of 850 men, including officers, and a small detachment of soldiers. To complete his order of battle, Commodore McDonough placed 2 of the gunboats inshore of the "Eagle," and the rest of the gunboats were placed in the intervals between the different vessels, thus forming two lines, distant from each other about 40 yards. The force of the enemy was largely in excess of that of the Americans. The "Confiance," Capt. Downie, carrying on her gun-deck thirty long 24's, an armament similar to that of the "Constitution"; on her topgallant forecastle she mounted a long 24 in circle, and 4 heavy carronades, and on her poop-deck 2 heavy carronades, making in all 37 guns. The "Linnet," Capt. Pring, carried sixteen long 12's; the "Chubb," Lieut. McGhee, carried ten 18-pounder carronades, and one long 6, and the "Finch," Lieut. Hicks, one 18-pounder columbiad and four long 6's. In addition, the English had 12 or 13 gunboats, 8 mounting 2, and the remainder 1 gun each. Their whole force consisted of 16 or 17 vessels, mounting in all 95 guns, and carrying about 1000 men. About 8 A.M. of the 11th of September the enemy stood in, with the wind northeast, to the attack. When the two squadrons were distant about a league, the enemy hove to to complete his line of battle, and as soon as his gunboats were in position the English filled with their starboard tacks aboard, and headed for the American squadron in line abreast; the "Chubb" heading well to windward of the "Eagle," the "Linnet" steering for the bows of the same brig, the "Confiance" shaping a course far enough ahead of the "Saratoga" to lay that vessel athwart hawse, and the "Finch," with the gunboats, standing for the "Ticonderoga" and "Preble." The Americans were anchored with springs. In addition, Commodore McDonough had run out a kedgeboard on each bow, and brought the hawsers in upon each quarter, letting them hang in bights below the water. To this seamanlike and wise provision the victory to a degree is due. The action was opened by the "Eagle," and as soon as her shots began to tell Commodore McDonough sighted a long 24-pounder and fired. The shot is said to have struck the "Confiance" in the outer hawse-hole, and, passing the whole length of her deck, killed and wounded several of her crew and disabled her wheel. Immediately all the long guns of the Americans opened, and it was soon apparent that the English flag-ship was suffering severely. Still she kept on in the most gallant manner, hoping to get to close quarters, when the overpowering battery of the "Confiance" would soon decide the day. Finding this impossible under the telling fire of the Americans and the baffling of the wind, Capt. Downie determined to anchor head and stern, but in using the kedge astern with this object the hawser fouled, when the starboard bows was let go, and the kedge became almost useless. The "Linnet" anchored soon after in a good position nearer than the "Confiance," and forward of the "Eagle's" beam. The "Chubb" kept under way, intending if possible to rake the American line. The "Finch" got abreast of the "Ticonderoga," supported by the gunboats. As soon as the "Confiance" was secured, Capt. Downie, with his whole broadside,

opened with fearful execution upon the "Saratoga." It is supposed by this single broadside one-fifth of her crew were killed or wounded. Among the killed was the first lieutenant, Mr. Gamble, and Acting Lieut. Vallette was the only officer left of that rank on board the "Saratoga" at this early stage of the action.

The battle now became general. The "Chubb," about a quarter of an hour after the enemy anchored, while manœuvring near the head of our line, was disabled by the fire of the "Eagle," and drifting down between the contestants, a shot was fired into her by the "Saratoga," when she struck, and was taken possession of by Midshipman Platt, and anchored near the mouth of the Saranac. About an hour later the "Finch" was crippled and driven out of her position by the "Ticonderoga," and drifting down upon Crabb Island, was taken possession of by the invalids belonging to the hospital. At this end of the line the enemy's gunboats made desperate attempts to close, and forced the "Preble," soon after the capture of the "Finch," from her place in line to a position considerably inshore, where she was of no further service. This accomplished, the enemy turned their attention to the "Ticonderoga," and so determined were some of these assaults that several times the gunboats laid in their sweeps preparatory to boarding, but the cool, determined fire they encountered defeated every attempt. At the other end of the line the Americans were suffering severely. The "Linnet" secured a commanding position, while the "Eagle" was so situated—her springs having been shot away—as not to be able to bring her guns fairly to bear on either the "Confiance" or "Linnet," who were firing into her. Capt. Henley now shifted his berth, and took up a position, anchoring by the stern, between the "Saratoga" and "Ticonderoga," necessarily a little inshore of both, and opened with better effect on the "Confiance" and her supporting gunboats; this change, unfortunately, left the "Saratoga" exposed to the raking fire of the "Linnet." Shortly after, the fire of the "Saratoga" and "Confiance" materially lessened. On the "Saratoga" every gun in her starboard battery was disabled,—nothing remained but to wind the ship, which McDonough, through the timely provisions already alluded to, succeeded in accomplishing, and her fresh broadside was brought to bear upon the "Confiance," which ship also attempted to wind, but failed, and having borne for some time the fresh broadside of the "Saratoga," until she had barely a gun to return the fire, the English commander-in-chief, two hours and a quarter after the commencement of the battle, lowered his flag. The "Saratoga's" broadside was immediately brought to bear upon the "Linnet," which vessel struck fifteen minutes later, when all the enemy's gunboats lowered their colors. All but two of these finally escaped, owing to the disabled condition of the large vessels, which required the crews of our gunboats at the pumps to prevent their sinking. This prevented pursuit. Our total loss was 52 killed and 51 wounded. The English lost 57 killed and 110 wounded on board the large vessels, and the two gunboats captured lost 30 in killed and wounded between them. The slaughter on board the gunboats that escaped is believed to have been very heavy. Though a report was circulated to the contrary, the English gunboats were well fought, and bore a conspicuous part in the conflict. Many of the American officers were wounded, though but two commissioned line-officers were killed,—Mr. Gamble, the first lieutenant of the "Saratoga," and Mr. Stansberry, the first lieutenant of the "Ticonderoga." Mr. Smith, the first lieutenant of the "Eagle," though severely wounded, after his wounds were dressed returned to his post, and remained during the action. Besides Capt. Downie, who was killed, the English lost several officers, and three or four were wounded. Both squadrons were fearfully cut up in hull, spars, and rigging. Commodore McDonough, by his consummate skill, heroic endurance, and indomitable courage, won in this splendid triumph a reputation second to none in the long line of our great naval captains. He was promoted and honors showered upon him. Capt. Cassin, who was throughout this memorable contest conspicuous for his heroic and determined courage in the defense of the rear of our line and for noble conduct, received high praise and merited honors, and all participating received also their share in distinction and honors. Mr. Vallette was specially mentioned, and the services of Mr. Brum, the master who superintended the winding of the "Saratoga" in the climax of the fight, were handsomely acknowledged. Capt. Henry and Lieut. Commandant Cassin gave merited praise to all under their command. Messrs. Conner, Breese, Robins, and Stellwagen, in command of gunboats, fought gallantly. Capt. Downie has been censured for his mode of attack, which brought him for some time under a raking fire,—a plan of attack which had been successfully adopted by the English in their naval fights with the European naval powers. That he was not successful with his largely superior force is to be attributed to the firm and unconquerable courage and magnificent gunnery of his adversaries. During the progress of the fight Sir George Prevost was skirmishing in front of the American works and preparing for a grand attack. The fate of the day was scarcely determined when he commenced a hasty and disorderly retreat, leaving behind him many of his heavy guns, stores, and supplies. From that time to the end of the war the northern frontier was cleared of the enemy.

In August, 1814, Commodore Sinclair, then in command on the upper lakes, made an unsuccessful attempt upon Mackinaw, though several vessels belonging to the Northwest Company were captured and a block-house destroyed. On the night of the 12th August the "Somers," "Ohio," and "Porcupine," while lying at anchor near the outlet of Lake Erie engaged in protecting the left flank of the American works, were attacked by six or eight heavy bateaus manned by a party of seamen under Capt. Dobbs. The "Ohio" and "Somers" were both surprised and captured, but the "Porcupine," having timely warning, escaped. The American loss was 1 killed and 10 wounded. By the resistance on the "Ohio" the enemy lost about the same. Lieut. Radcliffe, of the "Netley," was slain. On the night of the 3d September, Lieut. Worsley with five large boats, one conveying a 6- and another a 3-pounder, accompanied by 19 canoes and about 200 men, surprised at St. Joseph, owing

to the darkness of the night, and captured, after every officer on board of her was shot down, the "Tigress," Lieut. Champlin,—this vessel had a complement of 28 men and carried a 24-pounder. The enemy's guns were transferred to the vessel, and the evening of the next day Lieut. Turner, in the "Scorpion," anchored about 5 miles from her. The next morning, at daylight, the "Tigress" stood down, under American colors, towards the "Scorpion," and Turner, having no cause to suspect her change of character, permitted her to get close alongside, when she fired all her guns, ran the "Scorpion" aboard, and captured her after a slight resistance. Lieut. Turner was honorably acquitted, the surprise being attributable to the want of signals. In capturing the "Tigress" the enemy lost a lieutenant and 2 men killed and 7 wounded.

Capt. Steward having succeeded Commodore Bainbridge in command of the "Constitution," sailed in the winter of 1814 for a cruise through the West Indies, upon which occasion he captured the "Picton," 14, and made several prizes, and subsequently returned to Boston. On the 17th December she again sailed. On the morning of the 25th February, 1815, the "Constitution," then off the coast of Spain, captured, after an actual contest of about three-quarters of an hour, the "Cyane," a frigate-built ship, with an actual armament of 34 guns, and the "Levant," carrying 21 guns. The splendid seamanship of Capt. Stewart in the handling of the "Constitution" in the encounter with these two vessels, by means of which he not only succeeded in avoiding a raking fire by the enemy, but in raking both his opponents, has always been regarded with admiration by professional men. The "Constitution" lost 3 killed and 12 wounded. Capt. Stewart estimates the loss of the "Cyane" at 12 killed and 26 wounded, and on the "Levant," 23 killed and 16 wounded. Capt. Stewart proceeded with his prize to Port Praya, where he arrived on the 10th March. While lying here a heavy English force appeared in the offing, and knowing that the English would disregard all neutral rights unless supported by force, Capt. Stewart promptly got under way with his prizes and proceeded to sea. The English prisoners ashore manned a battery and fired at the "Constitution" as she passed out. The cool, prompt, decided conduct of Capt. Stewart in getting to sea saved his command. The ships in chase proved to be the "Leander," 50, "New Castle," 50, and "Acosta," frigate. The "Levant" was chased back into Port Praya, where she anchored within 150 yards of a strong battery. The enemy, disregarding the neutrality of the port, opened fire from all his vessels. After sustaining this for some time, Mr. Ballard, the officer in charge, lowered his colors. The reputation of Capt. Stewart, already very high, was largely added to by his conduct on this occasion. The "Constitution" arrived safely at Maranham, where he landed his prisoners, and, hearing that peace had been declared, sailed for New York, where he arrived the middle of May. Thus ends for the war the exploits of the noble "Old Ironsides," a ship dear to every American heart.

On the night of the 14th November, 1814, the "President," 44, in command of Commodore Decatur, in attempting to cross the bar at New York in the night got out of the channel, and, grounding upon the hard bottom, was considerably injured. It was impossible to return owing to the adverse tide, and as a strong blockading force was in the offing it was necessary to carry sail to get off the coast before morning. At daylight 4 ships were discovered in chase, when Commodore Decatur immediately commenced lightening. Soon after 3 o'clock P.M. the "Endymion," 40, the nearest vessel, opened with her bow-guns, the "President" returning the fire with her stern-chasers. Finding the fire of the "Endymion" very annoying, and that she was gradually gaining, Commodore Decatur determined to make an effort to exchange ships by carrying the "Endymion" by boarding, which intention was received with joy by his crew. All attempts to close, however, failed, when Commodore Decatur directed his efforts to dismantling her, and for two and a half hours the two frigates kept up a heavy fire, when the "Endymion's" sails being cut from her yards she fell astern. At this time the "President" was under all sail, and by choosing her position could have forced the enemy to strike, but the near approach of the other ships compelled Decatur to resume his original course to escape them. All efforts were made for the purpose, but by 11 P.M. the "Pomona," 38, got on the weather bow of the "President," and poured in a broadside; the "Tenedos," 38, was fast coming up on the quarter, and the "Majestic," razee, was within gunshot astern, when Commodore Decatur yielded. The loss of the "President" was 24 men killed and 56 wounded. Among the slain were the first, fourth, and fifth lieutenants, Babbit, Hamilton, and Howell. Much of the loss occurred from the fire of the "Pomona," who continued her fire after the signal of surrender was made. The "Endymion" lost 11 killed and 14 wounded. The fact that this vessel did not join the other ships for three or four hours after shows her crippled condition. The "President" was taken to Bermuda, where Decatur and his crew were paroled. He was acquitted with honor for the loss of his ship.

Off Tristan d'Acunha, on the 23d March, 1815, at 1.40 P.M., the "Hornet," 18, Capt. Biddle, engaged H. B. M. brig "Penguin," 18, Capt. Dickinson. For 15 minutes both vessels kept up a close and sharp cannonade, when the enemy, finding the fire of the "Hornet" too hot, bore up with the intention of boarding. The enemy's bowsprit came in between the main and mizzen rigging of the "Hornet," affording the opportunity, but the attempt was not made. The vessels lay in this position for a few minutes, the Americans pouring in a raking fire, when the sea lifted the "Hornet" ahead, the enemy swinging round and hanging on her starboard quarter. Capt. Biddle ordered the foresail to be set, when the enemy called out that they surrendered, but after this two marines fired at and wounded Capt. Biddle quite seriously, when the crew of the "Hornet" poured in a volley and shot them dead. The two vessels were equal in size, armament, and weight of metal and crew, but notwithstanding the "Penguin" had the advantage of the wind she was taken in 28 minutes. The "Penguin" lost 14 killed and 28 wounded. Among the slain was her commander and the boatswain; among the wounded a lieutenant, a midshipman, and the purser. The "Penguin" was completely riddled, and

lost both lower masts and bowsprit. The "Hornet" had 1 man killed and 10 wounded, including Capt. Biddle and Mr. Connor, her first lieutenant, whose life for a time was in great danger. The "Hornet" was a good deal cut up in her sails and rigging, otherwise her injuries were slight. A few hours after the action a suspicious sail heaving in sight, Capt. Biddle towed the "Penguin" some distance off the land and scuttled her, after taking such stores and provisions as he required. Shortly after the "Hornet" was chased by the "Belvidere," 74, and he only escaped capture by lightening his vessel and throwing overboard his battery. At times the "Belvidere" was so near that her shot passed beyond the "Hornet." Arriving at San Salvador, Capt. Biddle learned of the peace, when he sailed for New York, arriving on the 3d of July. For his splendid achievement in the capture of the "Penguin" Capt. Biddle received distinguished honors. The action between the "Hornet" and "Penguin" was the last regular action of the war.

In the Straits of Sunda, on the 30th June, 1815, the "Peacock," Capt. Warrington, captured the East India Company's schooner "Nautilus," 14, but Capt. Warrington on learning, a few days after, that peace had been ratified, gave her up. Government was about fitting out two flying squadrons of small vessels when peace was declared, and all operations ceased. Thus closed the war of 1812, a war in which the American navy, by the splendid prowess and signal successes over a power that had never found its equal upon the sea, covered itself with glory. The nation points with just pride to the exploits of our illustrious line of naval heroes, and as long as the republic lasts their gallant deeds will be remembered and honored.

At the breaking out of hostilities between the United States and Great Britain the Barbary powers, particularly Algiers, committed wanton aggressions upon our commerce, which at the time the government could not properly redress. These powers were little better than communities of pirates, to whom tribute for a long time had been paid by every nation, England included. Shortly after the termination of the war with that country war was declared by the United States against the dey of Algiers, and two squadrons were fitted out to punish him for his aggressions and perfidy. One was commanded by Commodore Bainbridge, and the other by Commodore Decatur, the former being appointed commander-in-chief. Decatur, with a squadron composed of 3 frigates, 1 sloop-of-war, 4 brigs, and 2 schooners, sailed from New York, May 20, 1815, for the Mediterranean. On June 17 an Algerine frigate was made out, which Decatur, in the "Guerriere," engaged and captured. She proved to be the Algerine frigate "Mashouda," 46 guns, commanded by Admiral Rais Hammada, who was killed. Shortly after, off Cape Palos, another Algerine corsair, the "Estudio," carrying 22 guns, was captured. On June 28, Decatur's squadron anchored in the Bay of Algiers, and in 24 hours, by his decision and firmness, Decatur succeeded in compelling a treaty such as had never before been obtained from any of the Barbary powers. With the prestige of this success Decatur appeared with his squadron in the Bay of Tunis on July 26, and immediately made certain demands upon the bashaw of Tunis, which, after some blustering on the part of the bashaw, were complied with. The United States was the first nation to compel these faithless powers to a recognition of maritime rights without the continuance of tribute, and her example being followed by other nations, these petty states soon declined into their proper insignificance. Since this time our relations with these people have been generally satisfactory.

In 1815, Commodores Rodgers, Hull, and Porter were appointed a Board of Navy Commissioners, and charged with all duties relating to the provision of supplies and stores, and the construction, armament, and employment of vessels. In 1819–20 Congress passed an act for the gradual increase of the navy, and authorized the building of 12 line-of-battle ships, 14 first-class and 3 second-class frigates, 6 sloops-of-war, and a proportionate number of small vessels.

In 1821 an expedition was fitted out for the suppression of piracy in the West Indies, where it prevailed to an alarming extent. On October 16, Lieut. Lawrence Kearney, commanding the "Enterprise," captured 2 piratical schooners and 1 sloop, with about 40 pirates. On October 29, Capt. Henley, of the "Hornet," captured the schooner "Moscow," which he sent into Norfolk. In the month of December following Lieut. Kearney destroyed the rendezvous of the pirates off San Antonio. On January 7, 1822, Lieut. Rammage, commanding the "Porpoise," destroyed 5 piratical vessels and broke up their depot on the north side of Cuba. On March 6, Lieut. Kearney captured 3 piratical launches and 4 barges with their crews, numbering about 160 men. On August 16, Lieut. Gregory, commanding the "Grampus," captured off Porto Rico the privateer "Palinurus," carrying one long brass 18, and eight 18-pounder carronades, with a complement of 85 men, her character as a pirate being well established. In the month of November, Lieut. Wm. H. Allen, commanding the "Alligator," an officer of great merit and distinction, was killed, with 2 of his men, in a successful attack upon the pirates. In September, Capt. Cassin captured, in the "Peacock," 5 piratical vessels. In February, 1823, piracy being still on the increase, our force in the West Indies was largely augmented, and placed under command of Commodore Porter. The Porto Rico privateers having upon several occasions interrupted our commerce, Commodore Porter sent a communication to the authorities upon the subject. Lieut. W. H. Cocke, in command of the "Fox," in attempting to enter the port of St. Johns in order to ascertain the probabilities of an answer, was killed by a shot from the castle, which opened a heavy fire upon the vessel and forced her to anchor. It is supposed that this was in retaliation for the capture of the "Palinurus." On the morning of April 8, Lieut. Stribling, in the "Gallinipper," captured the schooner "Pilot," formerly of Norfolk, commanded by the notorious buccaneer Domingo. About the same time Capt. Cassin captured a piratical felucca and broke up several piratical establishments, compelling the pirates to destroy 3 of their schooners. In July, Lieut. Watson, in the "Gallinipper," accompanied by the "Mosquito," Lieut. Inman, having a complement all told of 25 men and officers, attacked and captured a large piratical topsail schooner

and an armed launch, having on board about 80 men, most of whom were destroyed. The schooner was the "Catalina," commanded by the noted pirate Diaboleto, who was killed in action. In the same month Kearney, in the "Greyhound," and Newton, in the "Beagle," landed a force at Cape Cruz, and after a sharp encounter broke up a piratical settlement, burnt several houses, and captured some guns. In 1824, Skinner, of the "Porpoise," captured a schooner, and Paine, in the "Terrier," recaptured a French ship from the pirates. To add to the difficulties Commodore Porter encountered in his operations against the freebooters, there was an evident collusion between the authorities of some of the islands and these outlaws.

In October, Lieut. Platt, commanding the "Beagle," learning that one of our merchants residing at St. Thomas had been plundered, and that the pirates had taken the goods to Foxado, a small port of Porto Rico, proceeded thither to recover the property. On making known the object of his visit, he and Lieut. Ritchie, who accompanied him, were both arrested and detained under guard for a day. Commodore Porter upon learning this, with his characteristic promptness, proceeded to Foxado to demand explanation and redress. Finding that the authorities, upon his arrival there, intended to fire into his vessel, he landed a force, took their batteries, and compelled from the offenders the amplest apologies. Unfortunately, for this thoroughly justifiable retaliatory act Commodore Porter was relieved of his command, and Commodore Warrington succeeded him. This officer continued to carry out the plan of operations inaugurated by Commodore Porter.

In March, 1825, Lieut. Sloat, in the "Grampus," fitted out a trading-sloop with a complement of 27, all told, to capture a piratical vessel cruising off St. Thomas. The expedition resulted in the destruction of the pirate ship; 2 of her crew were killed and 10 made prisoners, among them being the celebrated piratical chief Colfrecinas, who, with the others, was executed by the authorities of Porto Rico. In May, Lieut. McKeever co-operated with the English in breaking up a piratical retreat and in capturing a large piratical schooner. These severe lessons finally broke up the nefarious business, and piracy, as an organization, ceased.

In February, 1832, Commodore Downes, in the "Potomac," arrived off Quellah Battoo for the purpose of chastising the natives for their piratical attack upon the ship "Friendship," of Salem. An expedition was fitted out from the "Potomac," and officered by Lieuts. Shubrick, Hoff, Ingersoll, and Mr. Totten, of the navy, and Lieut. Edson, of the marines. The Malays made a determined resistance, but were finally overcome, and several of their forts captured and destroyed. The lesson, though severe, was salutary and needed, and the good effects of this well-deserved punishment still continue in our intercourse with these semi-piratical people.

The United States Exploring Expedition sailed from Hampton Roads on the 19th August, 1838, under command of Lieut. Charles Wilkes. Midshipman Spencer and two of the petty officers of the brig "Somers" were executed on board that vessel December 1, 1842, for conspiring to capture the vessel and convert her into a pirate. Commander Slidell Mackenzie, the officer in command, felt compelled to adopt this summary course for the security of the vessel and the preservation of the lives of those under his charge. Upon his arrival in the United States a court of inquiry was ordered to inquire into all the facts connected with the transaction, which resulted in a complete and thorough justification of Commander Mackenzie and his officers.

In October, 1842, Commodore Thomas Ap Catesby Jones, commanding the Pacific Squadron, took possession of Monterey, Cal., under the supposition that war existed between the United States and Mexico; shortly after, receiving advices to the contrary, the town was restored. Subsequently, and upon the declaration of war between the two countries, Commodore Sloat, then in command of the Pacific Station, took possession of California, and hoisted the American flag at Monterey, San Francisco, and other points. Shortly after Commodore Sloat was relieved by Commodore Stockton, whose services were very valuable in securing the newly-acquired territory to the United States. Detachments of sailors and marines were left to hold the various points taken possession of. While occupying Los Angeles, the capital, information was received that Lieut. Gillespie, of the marines, with his command, were besieged in the government-house. The "Savannah," Capt. Mervine, went immediately to his relief. A landing was made of a strong force at San Pedro, and a march then commenced upon Los Angeles. When within about four miles of that place, they were met in force by a party of the enemy, having the advantage of a field-piece, by means of which the advance of our men was checked, and the command fell back upon San Pedro. Shortly after Commodore Stockton arrived and sailed for San Diego. From this point an expedition was fitted out for the purpose of re-occupying Los Angeles, which Lieut. Gillespie had been compelled to abandon, and of forming a junction with Col. Fremont, who was marching southward. While preparations were making for this purpose intelligence was received of the severe check Col. Kearney had received at San Pasqual, and of his critical condition. Lieut. Gray, of the navy, with a force of 200 men, was immediately sent to his relief, and soon after Col. Kearney, with the remainder of his command, arrived at San Diego. When Commodore Stockton's preparations were completed, he took up the line of march for Los Angeles with a force of about 600 men. On the 7th January the command arrived at the San Gabriel River, where the enemy were found strongly intrenched. On the next day our forces attacked vigorously, led by Commodore Stockton in person, and drove the enemy from the field. On the 9th, Commodore Stockton advanced upon the town, where he was again met by the enemy on the plains of Mesa. A sharp cannonade followed, the Mexicans making several abortive attempts to charge. After a final effort, Gen. Flores abandoned the defense, and moved off towards Sonora. Soon after re-occupying Los Angeles, Commodore Stockton was joined by Col. Fremont, when the combined forces amounted to 1000 men. Negotiations were entered into with Don Andreas Pico, the governor of California, by which the Mexicans agreed to lay

down their arms and yield quiet possession of the province. Thus to the navy mainly belongs the acquisition of California, with all its untold wealth. To Commodores Sloat and Stockton, for prompt and energetic management and firm and determined measures in these emergencies, the country owes a deep and lasting debt of gratitude. Shortly after these important occurrences, Commodore Stockton, having learned that Commodore Shubrick had arrived to take command of the naval forces in the Pacific, returned overland to the United States. In August, Capt. Lavalette took possession of Guaymas. In September, 1847, Lieut. S. C. Rowan landed with a party at San Blas and destroyed a number of guns. A very creditable affair occurred at Muleje, in which Lieuts. G. W. Hainson and E. Higgins, with Midshipmen Lewis and Crabbe, participated in the destruction of a Mexican brig by boats from the "Cyane." Later, Lieut. Hainson, with three of the "Cyane's" boats, successfully resisted an attack at Mazatlan of the enemy with a greatly superior force. On the 11th November, 1847, Commodore Shubrick occupied Mazatlan—the most important Mexican seaport on the Pacific—without opposition. On the 20th November, two parties—one in boats under Lieut. S. C. Rowan, and one on land under Lieut. G. L. Selden—were sent to disperse a force of the enemy about 10 miles from Mazatlan, which resulted in the total rout of the enemy. Our loss was 1 man killed and 3 officers and 17 men wounded; that of the enemy 7 killed and about 30 wounded. In the same month Commander Selfridge landed at Guaymas and drove the enemy from the place. Commander Selfridge was the only one wounded, while the enemy lost some 30 in killed and wounded.

On the 19th of November, Lieut. Heywood, with 4 officers, 20 marines, and the same number of volunteers, while occupying San José, Lower California, was attacked by 150 of the enemy. Lieut. Heywood upon this occasion repulsed the enemy, inflicting upon him severe loss. On the 22d of January, 1848, a detachment of Lieut. Heywood's command, consisting of Passed Midshipmen Duncan and Warley, with 6 men, were captured on the beach by a large party of the enemy's cavalry,—a serious loss to the little garrison. In the latter part of January the enemy again appeared in force at San José, and fired upon all who showed themselves. Several bold and daring sorties were made by the little garrison who occupied the old mission building for the purpose of checking the advance of the enemy. On the morning of the 12th Passed Midshipman McLanahan was mortally wounded, and survived but two hours. On the evening of the 14th the "Cyane" arrived and dropped anchor off the town. The next morning Commander Dupont, with 102 officers and men, landed and marched to the relief of the beleaguered garrison. Upon their approach Heywood sallied from the fort, and, charging upon the enemy, effected a junction with the relieving party. The loss to Dupont, though spiritedly opposed, was but 4 slightly wounded, while the enemy lost at least 13 killed. The casualties to Heywood's command during this heroic defense of 16 days, in which there was scarcely a time in which he was not under fire, were 3 killed and 4 wounded, while the enemy suffered a loss of 15 killed and many wounded. The high courage, inflexible resolution, and heroic endurance displayed in this remarkable defense against an active, vigilant, and untiring enemy with a largely superior force, places it side by side with the most brilliant achievements in American naval history. Aside from these various duties, the navy was employed on the west coast of Mexico in blockading her ports and in destroying her commerce. In the Gulf of Mexico, at the commencement of hostilities, Commodore Connor commanded our naval forces, and a system of rigid blockade was at once established. In addition to these duties, the navy was employed co-operating with the army whenever its services were required and could be made available. During the battle of Palo Alto, Maj. Monroe, in command of the depot at Point Isabel, having requested the aid of the navy, 500 seamen and marines were landed under Capt. Gregory for the purpose. On the 18th of May a detachment of 200 seamen and marines, under Capt. Aulick, effected a junction with a detachment of the army at Barita, about 15 miles from the mouth of the Rio Grande, and established a post. On the 23d of October, Commodore Perry, with several light-draft vessels, ascended the Tabasco River and took possession of Frontera, capturing all the vessels in port, including 2 steamers. Pursuing his way still farther up the river, several merchant vessels were captured, and the noon of the next day he reached Tabasco, where some opposition was encountered. Commodore Perry having effected the object of the expedition, he ordered the prizes to move down the river while the armed vessels followed. One of the prizes grounded near the shore, when the enemy opened fire upon her; the officer in charge, Lieut. Parker, defended her gallantly, and got his vessel off with 1 man killed and 2 wounded. In carrying a message from the commodore to Lieut. Parker, a very gallant and promising young officer, Lieut. Charles W. Morris, received a fatal wound, of which he died in a few days. Later an unsuccessful demonstration was made against Tabasco, which failed on account of the grounding of the steamer "McLane" on the bar, and also one against Tuspan, which resulted in the loss of the brig "Truxtun" and the capture of most of her officers and crew. In November an expedition was fitted out against the place, which resulted in its capture without opposition. On the night of the 20th of November, Lieut. Parker, Passed Midshipmen Rodgers and Hynson, with 5 men, destroyed the bark "Creole," loaded with munitions of war, anchored under the castle and guns of San Juan de Ulloa. On the 5th of December Passed Midshipman Rodgers and Dr. Wright, of the "Somers," landed for the purpose of a reconnoissance, but were surprised by a party of Mexicans. Dr. Wright made his escape, but Mr. Rodgers was made prisoner and taken to the city of Mexico, from whence, after enduring great hardships, he made his escape, and, joining the army of Gen. Scott, served with distinction during the final battles of the war. On the 8th of December the brig "Somers," in carrying sail to cut off a vessel attempting to enter the harbor of Vera Cruz, was struck by a squall and foundered, carrying with her the gallant Clemson and Hynson and 40 men.

Upon this occasion boats from the English, French, and Spanish men-of-war succeeded in rescuing quite a number. Gold and silver medals were given by the government to the participants in the rescue in acknowledgment of the gallant and humane assistance rendered. On the 20th of December, Commodore Perry took possession of Laguna, in the province of Yucatan, and seized all the military stores.

In March, 1847, Gen. Scott having decided upon the investment of Vera Cruz, the navy was employed in landing troops, provisions, and munitions of war for this purpose. Through the able and judicious arrangements of Commodore Connor, this was effected speedily and without loss. Gen. Scott made acknowledgment in the most forcible language for the valuable assistance rendered. Pending the bombardment of Vera Cruz, the health of Commodore Connor having failed, he was relieved by Commodore Perry. On the 22d of March the investment of the city being established, surrender was demanded. Upon this being refused, the batteries, assisted by the "Spitfire" and "Vixen," with 5 gunboats under the command of Tatnall, having taken up a position near the shore, opened fire; this position was gallantly maintained during the day. On the morning of the 24th, Tatnall, with his command, moved up still nearer, when it becoming apparent that he was in a highly exposed position, signal of recall was made. The officers of the navy naturally anxious to take an active part in the operations of the siege made known their desire, when Gen. Scott readily assigned a place in the trenches for the establishment of a naval battery of three 8-inch Paixhans and three long 32's, under the superintendence of Commander Mackenzie. The battery was served by detachments from the larger vessels, each detachment serving 24 hours, and was first opened under the command of Capt. Aulick, on the 24th, with marked effect until the supply of ammunition failed. The loss from this detachment was 5 killed and 1 officer and 4 men wounded. The relief arrived in the afternoon under the command of Capt. Mayo, who spent the night in repairing the breastworks, shattered by the severe fire of the enemy. Early on the 25th the fire of 4 heavy batteries was turned upon these works. Capt. Mayo opened a well-directed fire, which continued until half-past 2 P.M., when the enemy's guns were silenced. Two other batteries now opened upon him, which were soon rendered inefficient. Upon this occasion Midshipman Shubrick was killed while sighting a gun; 1 seaman was also killed and 3 wounded. In the evening Capt. Mayo was relieved by a detachment under Capt. Breese. The night was passed in repairing damages. The next day orders were received to discontinue fire, as negotiations were in progress for surrender. In the capitulation, Capt. Aulick represented the navy, and on the 29th of March city and castle were occupied by the army and navy under a grand salute from ships and batteries. Immediately after the fall of Vera Cruz, it was arranged that a combined attack should be made on Alvarado. Commodore Perry was to approach by the river, while Gen. Quitman, with a sufficient force, was to attack in the rear for the purpose of cutting off the retreat of the enemy, and securing a large amount of cattle and other supplies of the enemy in the neighborhood of the place. The main object of the movement was frustrated by the gallant but overzealous conduct of Lieut. Hunter, who attacked and occupied both Alvarado and Tlacotalpan before the arrival of either Perry or Quitman's commands. Shortly after Commodore Perry proceeded against Tuspan, which was occupied after a feeble resistance. The guns and ordnance stores of the "Truxtun," lost at the mouth of the river, were recovered. Capt. Mayo, who had been appointed governor of Alvarado, secured the submission of many of the interior towns. On the 16th of June, Commodore Perry again entered Tabasco after a weak resistance. A large quantity of military stores were destroyed, cannon brought off, the powder-magazine blown up, and the fortifications of the city demolished. Commander Bigelow, who was left in command, adopted prompt measures to punish the guerrillas operating in the neighborhood. At many points occupied by Commodore Perry provisional governors were appointed, the ports opened, and custom-house regulations established under our officers. During the latter part of the war, a detachment of marines under Lieut.-Col. Watson served with the division of Gen. Quitman, and took part in the storming of the fortress of Chapultepec, the storming-party, led by Maj. Twiggs, being composed of volunteers and marines, a party of sappers and miners under Capt. Reynolds, and a detachment of regulars from Gen. Twiggs's division under its own officers. The gallant and lamented Twiggs was killed on the first advance, but through a severe and withering fire the stormers pushed on with resistless force, and, sweeping all before them, captured the Mexican works, when the gallant party fought their way into Chapultepec by the side of their army comrades. The marines also acquired distinction in the attack upon the Bela gate, and were among the first to enter the city. Lieut.-Col. Watson, with his command, was placed in charge of the palace to preserve order and keep out plunderers. Lieut. Semmes and Passed Midshipman Rodgers, who served as volunteer aids, were specially commended for distinguished conduct in the battles around the city of Mexico. Shortly after the occupation of the city of Mexico peace was declared.

In the year 1848, Lieut. William F. Lynch sailed in the "Supply" with an expedition under his command to explore the river Jordan and the Dead Sea. In May, 1850, an expedition sailed from New York, consisting of the brigs "Advance" and "Rescue," for the purpose of searching for Sir John Franklin. In June, 1855, Kane's expedition and Hartstene's, for the same purpose, followed. In 1854, Commodore Perry, while in command of the East India Squadron, succeeded in establishing commercial relations with Japan. While Commander Kelly was at Shanghai in the "Plymouth," 1854, a combined attack of the American and English naval forces was made upon the encampment of the Imperialists in retaliation for aggressions committed by them. The Imperialists suffered severely. About this time an American pilot-boat was captured by the Imperialists, which was retaken in the most gallant style by Lieut. Guest in a boat of the "Plymouth." In the latter part of June, 1853, while Commander

Ingraham, in the sloop-of-war "St. Louis," was at Smyrna, he received information that a Hungarian refugee with an American passport and papers had been arrested by some Austrian officials and placed on board an Austrian brig. Commander Ingraham immediately made a demand for his release with the guns of the "St. Louis" bearing upon the Austrian, both vessels being cleared for action. Koszta, the Hungarian referred to, was finally released, and the spirited action of Commander Ingraham received the highest commendation from the government, and a gold medal was voted by Congress in recognition of his prompt, energetic, and patriotic conduct. In January, 1854, Lieut. Isaac G. Strain landed at Caledonia Bay for the purpose of exploring a route across the Isthmus, recommended as suitable for a ship-canal. About this time, in accordance with instructions, Capt. Hollins, in the sloop-of-war "Cyane," bombarded and destroyed the town of San Juan de Nicaragua, in retaliation for various outrages committed upon the persons and property of American citizens. On the 28th of September, 1854, the sloop-of-war "Albany," Commander Gerry, sailed from Aspinwall, and no trace of her having been discovered, is supposed to have foundered at sea.

In 1855, Commander John Rodgers, in the sloop-of-war "Vincennes," penetrated farther the Arctic Ocean, through Behring Strait, than any previous navigator. In the summer of 1855, Commander Boutwell, in the "John Adams," visited the Feejee Islands, and destroyed several villages in retaliation for outrages committed on our countrymen, and compelled the high chiefs to a promise of good conduct. During this year Lieut. James Gillis began to publish the results of his astronomical observations, and Lieut. M. F. Maury his wind and current charts, which have been of great value to the navigator and the interests of commerce. In 1855 a board was convened, under a law of Congress, by the Secretary of the Navy for the reorganization of the navy. Upon a forced construction of the law this board met in secret session, and officers were arraigned, tried, and sentenced without any intimation being given to the parties affected that they were even upon trial. Ninety officers of all grades were dismissed or dropped, and 150 placed on furlough or the reserved list. The whole proceeding was so repugnant to the entire country and opposed to all principles of justice, that Congress passed a bill for the relief of all affected,—every officer under this new legislation was afforded a fair hearing, and the opportunity to know wherewith he had been charged. In most instances where the revisory boards were appealed to for redress the work of the Star Chamber Inquisition was annulled, and the officers restored to their rights and rank. Of those who composed this secret organization some took the first occasion to desert their flag and country in the war of the Rebellion; others, in the time of trial, were found wanting, and passed into oblivion, while among the foremost for zeal, ability, and service, and distinguished for conspicuous gallantry in the national struggle for life, many were found who had been condemned by these men as unworthy to serve the country. During the year 1857, Berryman, in the "Arctic," was employed in running a line of deep-sea soundings across the Atlantic, to establish the practicability of laying wires across the ocean for telegraphic purposes. Our naval forces were engaged in arresting unlawful expeditions against Nicaragua, in resisting the exercise of the right of search by British cruisers in the neighborhood of Cuba, and in demanding and enforcing redress from the government of Paraguay for an insult to our flag and injuries to our citizens. The English bark "Resolute," abandoned in the Arctic Ocean and picked up by Capt. Buddington, in command of a New London whaler, was restored by the United States to the English government. In the beginning of 1858 the exploration of the Paraguay, under Lieut. Page, which had been interrupted by the Paraguayans, was resumed. In April, 1858, Lieut. Almy, in the "Fulton," compelled the release, at Tampico, Mexico, of 6 American vessels that had been illegally seized and detained. Lieuts. Craven, of the navy, and Michler, of the army, who had been employed in surveying a route for a ship-canal from the Atlantic to the Pacific, by way of the rivers Atrato and Truando, returned in June to New York. In August, Capt. Kelly, in the "Saranac," compelled by a display of force at San Juan del Sur, in Nicaragua, the release of two American citizens who had been unjustly imprisoned. In the same month Commander Sinclair visited Waga, one of the Feejees, and inflicted summary punishment upon the natives for the murder of two American citizens. In November, 1858, Flag-Officer Lavalette, in the "Wabash," visited Beyrout, Syria, to investigate the outrages committed upon our citizens, and the murder of Mr. Dickson near Jaffa. All but one of the party implicated were arrested, tried, and summarily punished.

War of the Rebellion.—The war of the Rebellion, that had been so long threatening, and finally inaugurated by the firing upon Sumter, found the country in a most untoward state of preparation. Our vessels were scattered in remote seas, and such was the condition of the navy that it might be reasonably supposed the conspirators against the nation's life had made the dispersion of our men-of-war a part of their scheme to assist in breaking up the Union and in carrying out their designs. Orders were immediately issued for the return of most of the national vessels from abroad, and a proclamation of blockade issued. To enforce the blockade, vessels of all description that could in any way be made serviceable for these purposes, or improvised as armed vessels, were purchased, and with the regular vessels of war were divided into two squadrons,—the one known as the Atlantic Blockading Squadron, under Flag-Officer Stringham, the field of whose operations extended from the Capes of Virginia to Cape Florida; the other the Gulf Squadron, under Flag-Officer Mervine, embracing the Gulf of Mexico from Cape Florida to the Rio Grande.* The sound of North Carolina affording more

* Soon after the secession of Virginia information was received at Washington of the designs of the Confederates upon the navy-yard at Norfolk. Several vessels of war, under a distinguished officer, were immediately ordered thither. Acting under instructions of the Navy Department, with a sufficient force for its protection, the great naval station, with an immense amount of valuable property in ships, guns, munitions of war, provisions, etc., was abandoned without a struggle. The "Merrimac," afterward converted into a powerful iron-clad, was one of the abandoned vessels.

than ordinary facilities for the evasion of the blockade, an expedition, under Flag-Officer Stringham, was fitted out in August, 1861, for an attack upon the defenses of Hatteras Inlet. It consisted of the flag-ship "Minnesota," Capt. Van Brunt; the frigate "Wabash," Capt. Mercer; steam-sloop-of-war "Pawnee," Commander S. C. Rowan; "Monticello," Commander J. P. Gillis; revenue-cutter "Harriet Lane," Capt. Faunce; "Adelaide," Commander H. S. Stellwagen; "George Peabody," Lieut. Commanding R. B. Lowry; and tug "Fanny," Lieut. Commanding Pierce Crosby, and a military force, 800 strong, under Gen. B. F. Butler. The inlet was defended by Forts Hatteras and Clarke, mounting heavy guns. The fire of the fleet, which opened about 10 A.M. of the 28th August, drove the enemy from Fort Clarke; the troops having been successfully disembarked, moved up the beach, and at 2 P.M. took possession. Early the following morning the fire from the fleet was renewed upon Fort Hatteras with such effect that before noon the enemy surrendered to the navy and army, and the fort was occupied by our troops. The enemy lost largely, but not a single casualty occurred on our side. The military force being insufficient, the important advantage gained could not be immediately followed up by securing a foothold on the mainland. With the breaking out of the Rebellion a flotilla, under the command of Commander J. C. Ward, was organized to prevent the obstruction of the Potomac River by the enemy through the erection of batteries. This gallant and accomplished officer was killed in October, 1861, in the prosecution of his arduous duties while in the act of sighting a gun to clear the way for a landing at Matthias Point. Commander Ward was the first officer of the navy killed in action during the war. Shortly after the capture of Hatteras Inlet the Atlantic Squadron was divided. Capt. L. M. Goldsborough was appointed to the North Atlantic Blockading Squadron, to guard the coasts of Virginia and North Carolina, and Capt. S. F. Dupont to the command of the South Atlantic Blockading Squadron, which comprised the coasts and waters of South Carolina, Georgia, and Florida. In February, 1862, the Gulf Squadron was also divided,—Flag-Officer McKean was appointed to the East Gulf Blockading Squadron, and Flag-Officer D. G. Farragut to the West Gulf Blockading Squadron, the dividing point being just eastward of Pensacola, which was included in the latter squadron.

North Atlantic Blockading Squadron.—Early in January, 1862, a joint naval and military expedition, under Flag-Officer Goldsborough and Gen. Burnside, moved from Hampton Roads for operating in the waters of North Carolina. The naval force consisted of the steamer "Valley City," Lieut. Commanding S. C. Chaplin, bearing the flag of Flag-Officer Goldsborough; "Delaware," Lieut. Commanding J. P. Quackenbush, bearing the divisional flag of Commander S. C. Rowan; "Stars and Stripes," Lieut. Commanding Reed Werden; "Louisiana," Lieut. Commanding Alexander Murray; "Hetzel," Lieut. Commanding H. K. Davenport; "Underwriter," Lieut. Commanding William N. Jeffers; "Commodore Perry," Lieut. Commanding C. W. Flusser; "Commodore Barney," Lieut. Commanding R. S. Renshaw; "Hunchback," Lieut. Commanding E. R. Colhoun; "Southfield," Acting Volunteer Lieut. Commanding C. W. F. Behm; "Morse," Acting Master Peter Hayes; "Whitehead," Acting Master C. A. French; "Lockwood," Acting Master G. W. Graves; "Henry Brinker," Acting Master J. E. Giddings; "J. N. Seymour," Acting Master F. S. Wells; "Ceres," Acting Master J. McDirmid; "General Putnam," Acting Master W. S. Hotchkiss; and "Shawsheen," Acting Master T. J. Woodward,—all light-draft vessels, with a total armament of 48 guns, most of them of heavy calibre. These vessels arrived about the 15th of January in the neighborhood of Roanoke Island, the first objective-point. It was not until some weeks later the army were ready for co-operation. Roanoke Island lies between Pamlico and Albemarle Sounds, being separated from the mainland by Croatan Sound, a shallow body of water. Opposite the southern extremity of the island the mainland juts out in a low marshy point, around which the vessels' course lay. On the morning of the 7th of February, the army being in readiness, the fleet moved up Croatan Sound in three columns, commanded respectively by Lieuts. Werden, Murray, and Davenport, the whole under the immediate command of Commander S. C. Rowan. The defenses in this direction consisted of a double row of piles and sunken vessels between the batteries on Polk and Wier Points, and behind these obstructions the enemy's vessels, 8 in number, were drawn up. The attack upon the enemy's defenses commenced at half-past 10; by noon the action became general, and was continued so hotly that, at 2 P.M., the barracks behind the fort on Polk Point were burning furiously. At half-past 4 the enemy's batteries ceased firing, and five of the enemy's steamers, apparently injured, retired behind the point, when the first landing of troops took place. This was effected at Ashby's Harbor, the point selected for debarkation, where a large force of the enemy were drawn up, but were soon dispersed by shrapnel from the "Delaware." By midnight some 10,000 of the troops were landed, when they were joined by six launches from the fleet, with their howitzers and crews, to hold the road during the night and be ready for work in the morning.

At 9 o'clock the next morning a continuous firing in the interior showed that Burnside was hotly engaged, when the vessels moved up and re-opened upon the forts, continuing the fire until, the firing in the interior beginning to slack, Flag-Officer Goldsborough concluded our troops were approaching the rear of the batteries, and made signal to cease firing and to proceed to clear the way through the obstructions, which the vessels burst through about 4 P.M., when the American flag was hoisted over the works at Pork Point. Shortly after, the enemy set fire to the works on Red Stone Point, and to a steamer which had taken refuge under its guns. Thus, after a two days' struggle, Roanoke Island fell into our hands. Retreating from Roanoke Island, the enemy's vessels fled towards Elizabeth City, while Commander Rowan, with 14 vessels, followed in pursuit. On the morning of the 10th they were discovered drawn up behind a battery of four heavy guns, and, moored to the opposite bank, lay the schooner "Black Warrior," carrying two heavy 32-pounders. When within

range fire was opened upon our vessels, which moved steadily on until within 1200 yards, when Rowan made signal, "Ahead, full steam," and dashed at the enemy, opening at the same time a vigorous fire. Completely demoralized by the suddenness and rapidity of the movement, the "Black Warrior" was set on fire by the enemy, the battery abandoned, and the entire fleet captured or destroyed. Pushing on, the flotilla took possession of Elizabeth City, and Lieut. Murray was sent with a small flotilla to Edenton, of which he took possession, and proceeded to obstruct the Albemarle and Chesapeake Canal, which he thoroughly accomplished. At the same time Rowan proceeded up the Chowan River as far as Winton, where, on the 19th, a sharp engagement occurred; but the next morning Col. Hawkins entered the town and destroyed the military stores and quarters found there. Commander Rowan having been left in command of the naval forces in the sound, a combined expedition of the navy and army was organized for an attack on Newbern, N. C. The fleet and transports proceeded up the Neuse River, and anchored, on the evening of the 12th of March, off Slocum's Point, the place selected for the debarkation of the troops. Early the following morning our vessels opened upon the landing-place with grape and canister to clear the way, when the troops landed. As soon as this was effected, the "Delaware" (flag-ship), with a supporting vessel, proceeded up the river on a reconnoissance, when they were fired upon by Fort Dixie, and a spirited engagement ensued, which lasted until dark. At daylight, on the 14th, Burnside, having with him a battery of howitzers under Lieut. R. S. McCook, engaged the enemy in force, while Rowan advanced steadily up the river with his fleet. The river was obstructed by piles and torpedoes, and at distances of from half a mile to a mile and a half formidable batteries of heavy guns were erected; but under pressure of the combined attack the enemy abandoned their defenses in succession, and at noon the fleet anchored off the deserted town of Newbern. A large amount of public stores fell into the hands of the navy, and were turned over to the army, who arrived and took possession of the town at 2 P.M. On the 21st, Lieutenant Commanding Murray took possession of Washington, N. C. In the beginning of April, Commander Rowan sent to New York 9 vessels loaded with captured naval stores. Fort Macon, Beaufort harbor, N. C., next engaged the attention of the army and navy. On the morning of the 25th of April, Commander Samuel Lockwood, with 3 steamers,—the "Daylight," "State of Georgia," and "Chippewa,"—opened fire upon the fort, and continued for about an hour and a half, when the vessels were obliged to haul off on account of the heavy sea. Towards evening a flag of truce appeared on the fort; negotiations for surrender followed, and terms of capitulation were agreed upon by Burnside on the part of the army, and Rowan on that of the navy. The army having failed to accomplish the object for which it was landed at Elizabeth City,—in destroying the canal,—Lieut. Hurser was dispatched for the purpose with 3 gunboats and 2 steamers, which duty he effectually accomplished.

On the 3d of March the enemy's ironclad "Merrimac," supported by several small gunboats, made an attack upon the frigates "Cumberland" and "Congress" off Newport News. The defense, though determined and valorous, was hopeless against this invulnerable monster, upon whose sides the heaviest shot from our vessels made no impression. Ramming the "Cumberland" just under the fore-chains, and inflicting mortal injuries, the noble vessel sank beneath the waters, carrying down with her many of her wounded, whom it was impossible to remove. The gallant and indomitable Morris commanded her, and fought his ship for two hours against all hope. In reporting to his commanding officer, he writes: "I will only say, in conclusion, all did their duty, and we sank with the American flag at the peak." The "Cumberland" lost, in killed and missing, a third of her crew. While the "Merrimac" engaged the "Cumberland" the smaller vessels attacked the "Congress." Her commander, seeing the fate of the "Cumberland," slipped his moorings and ran his vessel ashore. At half-past 3 the "Merrimac" opened upon her, directly astern, at a distance of about 150 yards. The smaller vessels of the enemy also opened. To oppose this fire the "Congress" had but 2 stern-guns, which were soon disabled. Lieut. J. Smith, the noble commander of the "Congress," fell mortally wounded about half-past 4, when the command devolved upon Lieut. Pendergrast. This officer, seeing the rapid slaughter of his men, finding it impossible to bring any of his guns to bear, with his ship on fire in several places, and with no prospect of relief, decided to lower his colors. An officer from the "Merrimac" boarded the vessel, ordered her surrender, and directed her crew to leave, as he intended to burn her. A sharp fire from the shore compelled the party to leave, when the enemy again opened fire, hauling off finally to engage the "Minnesota," which had grounded within a mile and a half of Newport News in coming to the relief of the "Congress" and "Cumberland." Fortunately, the heavy draft of the "Merrimac" prevented her getting nearer than a mile, but the 2 smaller vessels of the enemy opened with their rifle-guns and inflicted considerable damage until driven off by the heavy gun of the "Minnesota," when all three steamed towards Norfolk. While the "Minnesota" lay in this critical condition, Worden, in the "Monitor," appeared about midnight upon the scene. At 8 o'clock the next morning the "Merrimac" again approached. When within a mile of the "Minnesota," Worden got under way and went to meet her; then followed a contest upon the results of which not only the fate of the "Minnesota" depended, but also to a large degree the destinies of the Union and the fate of a great people,—a contest which was destined to revolutionize the whole system of naval warfare and operations, and give rise, in this regard, to a new order of things. With a sublime faith, an unerring judgment, and a stout heart, nobly Worden went to meet the grave and weighty responsibilities resting upon him. For four hours the furious combat raged between the monster "Merrimac" and the tiny "Monitor"—the Goliath and David of the deep—without apparent injury to either vessel, when the enemy retreated to Sewell's Point. Towards the close of this remarkable engagement the gallant Worden was

disabled by the explosion of a shell which struck the look-out slit in the pilot-house, through which, at the time, he was looking. The command then devolved upon his sturdy and courageous executive, Lieut. Dana Greene. No single encounter ever attracted throughout the civilized world so much attention, and rarely in history has the fate of a great nation been so dependent upon a single result. But for the genius of Ericsson, who planned the "Monitor," and the skill and courage of Worden and those who fought her, what would the pen of history have written!

Gen. McClellan occupied Yorktown May 14, and immediately requested the co-operation of the navy in his advance upon Richmond. On May 7, Gen. Franklin's command, while debarking from the transports at West Point, was heavily attacked by the enemy, when the immediate assistance of the navy was requested. Lieut. Commanding T. H. Stevens, in the "Maratanza," and Lieut. Wilkes Henry, in the "Sebago," moved up as near to the enemy's position as possible and opened fire. The assistance rendered to the army upon this occasion was of great value, and enabled Franklin to repulse the attack and hold his ground. The next day a division of gunboats under the command of Lieut. Commanding Stevens, comprising the "Maratanza"; "Chocura," Lieut. Commanding T. H. Patterson; "Marblehead," Lieut. Commanding S. Nicholson; "Sabago," Lieut. Commanding W. Henry, and another gunboat, proceeded up the Pamunkey River to open the way and in support of McClellan's advance. Stevens, in the "Chocura," proceeded as far as the White House, distant 12 miles from Richmond, arriving opportunely to give support to the cavalry advance under Col. L. Williams. Subsequently, Lieut. Commanding Murray, with an expedition of gunboats, went some distance beyond that point and destroyed a large amount of the enemy's property, including 2 large steamers and 25 vessels, Lieut. Commanding Stevens having in the mean time been ordered to the James River to take part in the contemplated attack upon the battery at Drury's Bluff. On the 8th of May the "Monitor" opened fire upon the Sewell's Point batteries, when the "Merrimac" came out, but showed no disposition to engage. Two days after, Norfolk surrendered to Gen. Wool, and the next morning the "Merrimac" was blown up by the enemy. About this time Commander John Rodgers, in the "Galena," with the "Aroostook," Lieut. Commanding J. C. Beaumont; "Monitor," Lieut. Commanding Wm. N. Jeffers; "Port Royal," Lieut. Commanding George Morris, and "Naugatuck," arrived at Drury's Bluff, 8 miles from Richmond, where a heavy battery had been erected, which Rodgers with his command opened upon. The fire was kept up for 3 hours, when the ammunition giving out, and the "Galena" being badly cut up, the vessels withdrew. On the 4th of July, Lieut. Commanding T. H. Stevens, in the "Maratanza," captured the enemy's gunboat "Teazer," near Haxhall's Landing. She was provided with all the appliances for laying down torpedoes, and had on board a large balloon for reconnoitring purposes.

During the summer the navy was employed on the James in co-operating with the army and in keeping the James River open, and at the battle of Malvern Hill the fire of the gunboats contributed materially to the success of the day. On the 5th of September, Rear-Admiral S. P. Lee relieved Goldsborough (who had asked to be relieved) in command of the North Atlantic Blockading Squadron. In the sounds of North Carolina the navy was constantly occupied during the summer in assisting the army to hold the occupied points and in aiding the movements. On the 6th of September the enemy attacked and entered Washington, N. C., but were driven out by the timely action of Lieut. R. T. Renshaw, who opened fire from the "Louisiana" upon them. About the 1st of October an unsuccessful combined movement was made upon Franklin, Va. Upon this occasion numerous acts of distinguished gallantry were performed, and Lieut. Commanding Flusser, who commanded on the part of the navy, specially commended the intrepid and dashing Cushing to the notice of the Department. In the latter part of November the enterprising Cushing led an expedition which had for its object the destruction of salt-works and vessels engaged in the contraband trade, and the capture of public property at Jacksonville, N. C., in all of which he was successful. On his return his vessel, the "Ellis," grounded. All attempts to lighten her proved unavailing. Everything was removed to the schooner in company, but the pivot-gun, some stores, and 6 men, who volunteered to remain with their commander, when she was ordered to drop down. The next morning a heavy cross-fire was opened upon the "Ellis," which soon disabled the engine, but the brave little party held on until the time came when they must either surrender or attempt to escape in the small boat. The "Ellis" was fired and abandoned, and the gallant party happily escaped to the schooner and passed out to sea. On the 29th of December the famous "Monitor" foundered off Hatteras with 4 officers and 12 of her men; the rest of the crew were saved through the coolness and gallantry of her commanding officer, Lieut. Bankhead The year 1863 was spent by the North Atlantic Blockading Squadron in constant activity in guarding the extended coast, penetrating the rivers and sounds, repelling attacks upon occupied points, and protecting and aiding the army in times of difficulty and embarrassment.

On the 17th April, 1864, the enemy besieged Plymouth, N. C., and two days after the iron-plated ram "Albemarle" descended the Roanoke and attacked the wooden gunboats off that town, sinking the "Southfield," and disabling the "Miami," whose gallant commander, Lieutenant Commanding Flusser, was killed, and obtained possession of the river. The next day the defenses of the town were carried, the garrison made prisoners, and the control of the upper sounds passed into the enemy's hands. On the 5th May the enemy besieged Newbern, when the ram again came out. Capt. Melancton Smith, the senior naval officer, promptly engaged her with the "Mattabassett," "Wyalusing," "Sassacus," and "Whitehead." After an engagement lasting 3 hours, the ram retired up the river. On the night of the 27th October, Lieut. W. B. Cushing, who had been selected for the duty, with 14 men in a light picket launch, having attached a torpedo of great power, ascended the Roanoke River to Plymouth,

approached the ram under a heavy fire and sunk her. A shot from the "Albemarle" just as the torpedo exploded sunk the launch. Cushing with four of his daring party escaped miraculously, the remainder were killed or wounded. This dashing and brilliant achievement accomplished, Commander Macomb with his command pushed into the town, drove the enemy out and took possession of the place with all its armament, and re-established the supremacy of the government in the waters of North Carolina. In July, 1864, Lieut. Cushing, with Ensign J. E. Jones and Master's Mate William Howertt and 15 men, made a daring reconnoissance to Wilmington, and returned with valuable information in regard to the enemy's fleet and fortifications off Wilmington. In the fall of 1864, the government having decided upon a demonstration against Fort Fisher and the defenses of Wilmington, Admiral D. D. Porter was assigned to the command of the naval forces, and Gen. B. F. Butler those of the army. On the 18th December, Admiral Porter sailed from Beaufort with all the monitors and smaller vessels, and off New Inlet, N. C., was joined by the larger war-vessels and transports assembled there. Preparatory to the attack a novel experiment was first to be tried, in the attempt to blow up Fort Fisher by the explosive power of a large quantity of powder placed in a vessel called the "Louisiana," fitted for the purpose. The gallant and chivalrous officers volunteering for this extremely perilous enterprise were Commander A. C. Rhind and Lieut. Preston, both of whom had been already conspicuous in dashing enterprises. On the night of the 23d the powder-boat was towed so near the shore that the guns in the casemates of Fort Fisher were distinctly to be seen. The vessel being in position, the fuzes, etc., were lighted by the brave little party, who then took to the boat and pulled away. In about an hour a terrific explosion occurred, but without the hoped-for results, no material damage being done to the fort. The morning after the explosion the fleet appeared off Fort Fisher and opened fire, to which the fort replied briskly for some time, and then relapsed into silence under the concentrated fire of the fleet. Two of the enemy's magazines were blown up. On the 25th the transports arrived, when the fleet again opened fire. Upon an arranged plan 3000 troops landed about 5 miles from the fort, and a reconnoissance was made in the neighborhood of the works. Two light batteries and a few men were captured. Gen. Butler having decided that the works were uninjured as works of defense, and could only be reduced by a regular siege, for which he was not prepared, withdrew his command to the transports and returned to Fortress Monroe. The fleet remained and kept up a steady fire. On the 8th of January, 1865, Gen. Grant having decided to send a competent force, Gen. Terry with his command arrived at Beaufort. A plan of operations having been decided upon between Admiral Porter and Gen. Terry, the troops under cover of the fire of the fleet were all landed by 2 P.M. of the 14th. The next day was appointed for the grand attack. At 9 A.M. the fleet opened a vigorous fire, which was sustained throughout the day, and the enemy were soon driven to their bomb-proofs. Sixteen hundred sailors and 400 marines, under Lieut. R. K. Breese, were landed to join in the assault. When the army was put in motion, the men from the fleet were ordered to advance also; the former to assault on the land side, the latter on the sea front of the fort. The attack on the part of the navy resulted in a repulse, though the demonstration served a good purpose in diverting the attention of the enemy, who supposed this to be the main attack, so that the army met with less opposition. The fire from the fleet was kept up on those portions of the fort held by the enemy, the direction of the fire being changed as the traverses were occupied by our troops. In this remarkable manner the army and the navy co-operated, and in 7 hours this enormous work, assisted by the fire of the fleet, was captured by a handful of men. Seventy-five guns were captured, and 2500 men taken prisoners, among them Gens. Whiting and Lamb, who were wounded. Porter, his officers, and men received the thanks of Congress. Twenty-four hours after the fall of Fort Fisher, Fort Caswell, Baldhead Fort, and Fort Shaw were evacuated. Fort Campbell was abandoned a few hours later, and this entire chain of rebel defenses fell into our hands. About the 15th February the combined forces resumed operations against Wilmington. Fort Anderson, the most important work remaining to the enemy, surrendered on the 18th February, after a vigorous bombardment by the vessels of the fleet, supported by Gen. Schofield, who advanced upon the fort with 2000 men. On the 21st February the enemy were driven from Fort Strong, and on the 22d Wilmington was evacuated.

During the year 1864 a portion of the naval force attached to the North Atlantic Blockading Squadron was actively engaged in co-operating on the James River with the army of Gen. Grant. A number of sharp and severe engagements occurred between these vessels and the powerful batteries which lined the shore of the river, in many of which the navy acquired great credit, particularly in the engagement with the rebel batteries at Deep Bottom, where Commander A. C. Rhind, in the "Agawam," specially distinguished himself for "gallantry and endurance," and received the thanks of the Navy Department.

South Atlantic Blockading Squadron.—In October, 1861, a joint naval and military expedition was organized, the object being to seize and occupy points on the Southern coast as places of supply and to afford protection to loyal citizens. Flag-Officer S F. Dupont was appointed the naval commander, and Gen. W. T. Sherman to the command of the military forces. Port Royal, S. C., was selected as the first objective-point. On the 29th of October the fleet, consisting of 48 vessels, including transports, sailed from Hampton Roads. Off Hatteras the severest storm known for many years was encountered, in which the steamer "Governor," having on board the battalion of marines, was lost, and also the transport steamer "Peerless." The crew and marines of the former were rescued by Capt. Cadwallader Ringgold in the "Sabine," and the crew, etc., of the latter were saved by Commander S. Godon in the "Mohican." On the morning of the 4th of November the rest of the fleet anchored off the bar of Port Royal. The buoys, etc., having been removed, Commander C. H. Davis and Mr. Boutelle, of the coast survey,

sounded out the channel and buoyed it. The "Ottawa," Lieut. Commanding T. H. Stevens; "Seneca," Lieut. Commanding D. Ammen; "Pembina," Lieut. Commanding J. P. Bankhead; "Pawnee," Lieut. Commanding B. H. Wyman; and "Curlew," Lieut. Commanding P. G. Watmough, were sent forward to cover the transports, which crossed the bar and anchored in the lower anchorage of Port Royal. The enemy's fleet under Tatnall shortly after steamed down the harbor, when the gunboats got under way and chased them under the forts. The next morning Gen. Wright and Commander John Rodgers, in the "Ottawa," supported by the other gunboats, made a reconnoissance and drew the fire of the forts on Bay Point and Hilton Head sufficient to show them to be works of strength and well constructed. A fleet of 7 of the enemy's vessels, armed with rifle-guns, occupied the inner portion of the harbor. Preparations for the attack were immediately made. The order of battle comprised a main squadron in line ahead and a flanking squadron to engage the enemy's flotilla and cover the rear of the main line as the ships swung to the southward. The main squadron consisted of the "Wabash," Commander C. R. P. Rodgers; the "Susquehannah," Capt. J. L. Lardner; "Mohican," Commander S. W. Godon; "Seminole," Commander J. P. Gillis; "Pawnee," Lieut. Commanding R. H. Wyman; and gunboats "Unadilla," Lieut. Commanding N. Collins; "Ottawa," Lieut. Commanding T. H. Stevens; "Pembina," Lieut. Commanding J. P. Bankhead; sailing sloop-of-war "Vandalia," Commander F. S. Haggert, towed by the "Isaac Smith," Lieut. Commanding J. W. A. Nicholson; and the steamer "Augusta," Commander E. G. Parrott. The flanking squadron consisted of the steamer "Bienville," Commander Charles Steedman; the gunboats "Seneca," Lieut. Commanding D. Ammen; the gunboat "Curlew," Lieut.-Commander P. G. Watmough; "Penguin," Lieut. Commanding T. A. Budd; and the steamer "Augusta," E. G. Parrott. The plan of attack was to pass midway between the forts, engaging both batteries to a point about 2½ miles beyond; then to turn to the southward round by the west, and after passing Hilton Head to turn to the northward by the east. These evolutions were to be repeated. Three times the larger vessels of the fleet circled between the forts, while the gunboats "Ottawa," "Seneca," "Pembina," and "Curlew" took up an enfilading position after passing between the forts, and poured in a destructive fire upon the Hilton Head fort, which was very effective. The engagement lasted three hours, when the enemy deserted the Hilton Head defenses. With the fall of these works the fort on Bay Point was also abandoned. Flag-Officer Dupont, his officers, and men received the thanks of Congress. In the latter part of November Tybee Island, at the mouth of the Savannah River, was occupied without opposition. At about the same time naval reconnoissances were made by Commander Drayton in St. Helena Sound, and in the Coosa and Ashepoo and the North and South Edisto Rivers. He found the works erected by the enemy abandoned. St. Helena Island was occupied by the navy. Similar reconnoissances were made in Warsaw and Ossibaw Sounds, with like results, excepting on the eastern end of Green Island a battery was found erected of 8 guns. In the latter part of December, Gen. Sherman having requested the co-operation of the navy to arrest the designs of the enemy, who were attempting to shut up our forces on Port Royal Island by obstructing the Coosa and Whale Back Rivers and by erecting batteries at Port Royal Ferry, Seabrooke, and Boyd's Neck, where the enemy had concentrated a force of 3000 men, Commander C. R. P. Rodgers was appointed to command the naval forces, which consisted of the "Ottawa," "Seneca," "Pembina," "Ellen," and "C. B. Hale." The attack was made on the 1st of January, 1862, and the movement was entirely successful. Gen. Isaac Stevens, who commanded the military forces, rendered the most cordial thanks for the hearty co-operation and assistance of the navy.

On the 1st of February, an expedition under command of Commander C. H. Davis, consisting of the "Ottawa," "Seneca," "Isaac Smith," "Potomska," Lieut. Commanding P. G. Watmouth, "Ellen," and "Western World," with 3 army transports, having on board 2400 troops, under command of Gen. H. G. Wright, sailed from Port Royal to make a reconnoissance of the Little Tybee River and adjacent streams. Commander C. R. P. Rodgers, with 2 armed launches of the "Wabash," accompanied the expedition. On the 2d the vessels entered the Little Tybee, and after passing Fort Pulaski without being fired upon, proceeded to a point beyond the high lands on Wilmington Island. Here a row of piles were placed, and the vessels anchored. Scouting-parties were sent out in all directions without seeing anything of the enemy, and Lieut. Commanding Ammen landed and cut the telegraph-wire between Fort Pulaski and Savannah. About noon 5 steamers of the enemy, under command of Tatnall, having scows in tow, attempted to pass down the Savannah River, but were driven back by the fire of the gunboats. At night-fall the expedition got under way, to the regret and disappointment of most connected with it, and returned to Port Royal. Nothing but a few rotten piles and rusty guns many believed stopped the way to Savannah in that direction. Commander Davis was a strict constructionist of orders, and, however promising of success, did not feel justified in making the attempt. On the last of February, 1862, Flag-Officer Dupont left Port Royal with most of his squadron and several transports, having on board a brigade of troops under Gen. Wright, for the purpose of attacking Fort Clinch. On the 2d of March, when off St. Andrews, the entrance to Cumberland Sound, all the light-draft vessels were directed to proceed through the sound for the purpose of attacking the fort in that direction, while the heavy vessels were to proceed outside and attack from that quarter. In passing through the narrow and difficult inside passage one after another of the vessels grounded; and the "Ottawa," Lieut. Commanding Stevens, alone succeeded in getting through. When within about 3 miles of the fort, Commanders Drayton and C. R. P. Rodgers came on board that vessel. It being the impression that the enemy were about to abandon the fort, the "Ottawa" proceeded at full speed to cut off the retreat of the enemy and to prevent the destruction

of property. In passing Fort Clinch, Lieut. G. B. White, the executive of the "Ottawa," was sent in the gig to hoist the American flag over the first national fort retaken from the rebels. While passing up to the draw of the railroad bridge, a train of cars was descried leaving Fernandina, to which the "Ottawa" gave chase, and disabled by a shot from her pivot-gun. The steamer "Darlington" also attempted to escape, but was brought to by a well-directed shot from the "Ottawa," when Commander Rodgers, of the "Wabash," who had brought to that vessel two of his armed launches, boarded the "Darlington" and took possession. A pilot-boat was also captured, and all the guns, munitions of war, stores, etc., belonging to the fort. That night the "Ottawa" proceeded up the river to the town of St. Mary's, which Commander Rodgers took possession of about midnight, capturing the horses and accoutrements of a cavalry guard, which, so sudden was the surprise, the enemy did not find time to mount. The next morning, learning that 2 steamers had escaped up the river, Lieut. Commanding Stevens pushed on in pursuit, going as far as Woodstock Mills, a point 50 miles above St. Mary's. On the return of the "Ottawa," she was heavily attacked from both sides of the crooked river, not 100 yards wide, by a large body of the enemy. The firing was kept up for a distance of about 2 miles, and was so severe as to drive our men from all the guns but the howitzers, which were well served, and from the effects of which the enemy must have suffered severely. Scarcely a person on board the "Ottawa" escaped untouched in clothing or person. On the 7th of March, Commander Godon, in the "Mohican," having with him the "Potomska" and "Pocahontas," took possession of Brunswick, Ga. About the same time an expedition was organized under Lieut. Commanding Stevens, to make a reconnoissance of the St. John's River as far as Jacksonville, Fla. The expedition comprised the "Ottawa," "Seneca," Ammen, "Pembina," Bankhead, "Isaac Smith," Nicholson, and "Ellen," and about 1000 troops. About 10 o'clock in the evening of the day the vessels crossed the shallow and difficult bar at the mouth of the river large fires were discovered in the direction of Jacksonville, which proved to be the burning of saw-mills, the property of men with Union proclivities, and a gunboat on the stocks was also destroyed. The expedition was entirely successful. The batteries at the mouth of the river were abandoned, and also a fort on St. John's Bluff, and their guns secured. Upon approaching Jacksonville, a boat bearing a flag of truce came alongside of the "Ottawa" to surrender the city, which was taken possession of without opposition. Penetrating into Dunn's Creek, Lieut. Stevens found the famed yacht "America," which had been sunk by the enemy. She was raised and taken to Port Royal. It is understood she had been purchased by the Confederacy for $60,000 in gold, for the purpose of taking their commissioners, Slidell and Mason, to Europe. On the 12th of May, Commander C. R. Rodgers received the surrender of St. Augustine, Fla. The results of these various expeditions gave us possession of the coast and inland waters from St. Simon's southward. Upon the information derived from Robert Small, a colored pilot, who had made a daring escape from Charleston, Stone River and inlet were occupied. In March, Lieut. Commanding Budd and Acting Master Mather, and others, were ambushed and killed while engaged on a boat expedition into Mosquito Inlet. After a bombardment of 2 days, Fort Pulaski surrendered on the 12th of April. Commander C. R. P. Rodgers, upon this occasion, represented the navy in command of Battery Siegel, officered and manned by a detachment from the "Wabash." On the 26th of January, 1863, Commander J. L. Worden, in the monitor "Montauk," engaged for 4 hours the enemy's battery at Genesis Point, on the Great Ogeechee River. On the 30th of January, the Confederate rams raided the blockading fleet off Charleston, disabling the "Mercedita" by a shot which exploded her boiler and scalded many of her crew, and by the explosion of a shell set the "Keystone State" on fire. Le Roy, who commanded the latter vessel, hauled off to extinguish the fire, which done, he ordered a full head of steam with the intention of running down one of the ironclads. In the act of running for her with a speed of 12 knots, a shot struck her steam-chest and disabled the vessel. In the mean time, Parrot in the "Augusta," Fraley in the "Quaker City," and Watmough in the "Memphis," kept up a steady fire upon the enemy, in which they were shortly joined by the "Housatonic," Taylor, when the enemy soon withdrew. The "Keystone State" lost about a fourth of her crew in killed and wounded. On the 30th of January the steamer "Isaac Smith," having grounded in Stono River under the fire of a heavy battery, after a gallant resistance, was captured. At daylight on the 27th of February, Commander Worden, in the monitor "Montauk," accompanied by the gunboats "Seneca," Gibson, "Wissahickon," Davis, and "Dawn," shoved up under a heavy fire from Fort McAllister, and destroyed the enemy's armed steamer "Nashville," lying under the fort, by a well-directed shot from the "Montauk," which exploded her magazine. Government having determined to attempt the capture of Charleston, a force consisting of the ironclad "New Ironsides," Turner, accompanied by the monitors "Passaic," Drayton, "Weehawken," John Rodgers, "Montauk," Worden, "Patapsco," Ammen, "Catskill," George W. Rodgers, "Nantucket," Fairfax, "Nahant," Downes, and "Keokuk," Rhind, crossed the bar off Charleston, on the 6th of April, and anchored outside. At noon the next day the vessels moved to the attack. The plan of attack contemplated passing by Fort Sumter without stopping to engage any of the supporting batteries, which fort was to be attacked on the northwest front. The heavy fire of these batteries, together with the nature of the obstructions, defeated this intention, and the fleet were compelled to make the attack from the outside, on the sea front of the fort. The attack was a failure. Several of the monitors were reported partially disabled, and the "Keokuk," whose chivalrous commander had carried her almost under the walls of Fort Sumter, was so badly cut up that she sank the next morning. On the 17th of June the enemy's ironclad "Atlanta" was captured, after a brief engagement of 15 minutes, by the monitor "Weehawken," John Rodgers, and taken possession

of by a boat from the "Montauk," Downes. The action was so brief the "Nahant" did not have an opportunity to fire, and the "Weehawken" fired but 5 shots. On the 6th day of July, Rear-Admiral Dupont was relieved at his own request by Rear-Admiral Dahlgren, in command of the squadron. On the 18th of July a combined attack was made upon Fort Wagner by the troops and ironclads. The fort was engaged at short range by the latter, and silenced for the day, but the troops were repulsed, owing to the inadequacy of the force. On the 17th of August the land batteries opened upon Sumter, in which the "Patapsco" and "Passaic" joined, while the "Ironsides" and the other monitors engaged Wagner. Forts Sumter and Wagner were silenced. During this engagement the gifted and gallant George W. Rodgers, in command of the "Catskill," was killed, and also Paymaster Woodbury, who was standing by his side. On the 22d of August, Commander T. H. Stevens, in the "Patapsco," and Commander E. Ross Colhoun, in the "Weehawken," engaged Fort Wagner for about 2 hours. About this time several changes occurred, Commander Rodgers having been killed, and Fairfax and Downes relieved at their own request. Commander Bryson was ordered to the command of the "Lehigh," Lieut. Commanding John Lee Davis to that of the "Montauk," Lieut. Commanding Cilley to that of the "Catskill," and Cornwell to that of the "Nahant." On the 23d of August the "Ironsides" and all the monitors bombarded Sumter for about 4 hours at a distance of 800 yards under a very heavy cross-fire from the enemy's defenses. On the 31st of August a division of monitors under Commander T. H. Stevens, embracing the "Patapsco," "Weehawken," "Passaic," and "Nahant," attacked Fort Moultrie and the adjacent batteries for about 3½ hours, when signal was made to withdraw. Some of the monitors were heavily hit. Simpson, commanding the "Passaic," in his work on "Armored Vessels," refers to this engagement as the severest that had occurred between land batteries and ironclads. On the night of the next day another demonstration, participated in by the "New Ironsides" and all the monitors, was made upon Sumter, which lasted for about 4 hours under a heavy cross-fire from the enemy's batteries, considerable damage being done to some of the monitors. On the night of the 6th, under the combined operations of the army and navy, Forts Gregg and Wagner fell, and Morris Island was evacuated by the enemy.

At 5.30 P.M. of the 7th the "Ironsides" and all the monitors, with the exception of the "Weehawken" (aground), got under way to attack the enemy's defenses on Sullivan Island. The object of the demonstration was to cover the "Patapsco" while she proceeded to make an examination of the obstructions. When the enemy discovered the object of the movement, all the batteries upon Sullivan Island opened upon the "Patapsco." Under this terrific fire she was struck 23 times in as many minutes. She proceeded to within 150 yards of Fort Sumter and the obstructions, and having made the required examination, dropped down to the flag-ship, when Commander Stevens went on board to report. On the morning of the 8th September, the "New Ironsides" and all the monitors, under command of Commodore Rowan, got under way and anchored within 800 yards of the batteries on Sullivan Island to cover the "Weehawken," still aground. The engagement, lasting 3 hours, was very severe, during the close of which the "Patapsco" was disabled and towed to her anchorage. Admiral Dahlgren, having the impression that there was nothing but a corporal's guard in Sumter, sent, on the night of the same day, an expedition composed of 400 men and officers in 40 boats, under Commander Stevens, to surprise the fort. On nearing Sumter the boats were hailed, and simultaneously a rocket was sent up from the northeast bastion, when all the batteries on James and Sullivan Islands, and an ironclad with grape and canister, opened upon the attacking party, and the solitary approach to the fort—the parapets—being lined with sharpshooters, the boats were being rapidly sunk by hand-grenades and heavy stones; those who had landed could not get back through the terrific tempest of shot and shell, grape and canister and musketry, nor could relief be rendered them, and as a further persistence in the attack would have been madness, the order was given to fall back. About a fourth of the command was killed or taken prisoners; among the latter the gallant Porter, Preston, and Williams, who were among the first to land. Gen. Beauregard, who commanded the defenses in Charleston harbor, writes: "If we had not opened so soon and fired so rapidly we would have captured or destroyed your whole command." The enemy were enabled to read all our signals, and as the preparations, imperfect as they were, were made in open day, the enemy were fully prepared—as Gen. Beauregard states and the sequel shows—to repel the assault. Just outside of the line of fire lay a number of army-boats loaded with men ready to participate had the movement been a success, which retired without making a single demonstration. For about 10 days in November the monitors "Patapsco" and "Lehigh" co-operated with the army in bombarding Sumter until it was reduced apparently to ruin; but no subsequent attempts were made to occupy it until Charleston was flanked by Sherman, when all its defenses were abandoned. In February, 1864, a division of gunboats was sent to the St. John's River to co-operate with the army in a movement into Florida. On the night of the 17th February, 1864, the sloop-of-war "Housatonic" was sunk off Charleston by a torpedo-boat. Other similar but fruitless attempts were made upon our vessels. In February, Admiral Dahlgren having received a leave, Commodore Rowan was left temporarily in command. In March a diversion was made into Bull's Bay. In May a force was detailed to co-operate with the army in an effort to sever the railroad between Charleston and Savannah. Information having been received of Sherman's advance to the sea, at the proper time every available means were used to aid in the success of the movement by creating diversions in various directions and to embarrass the enemy. On the 12th December Sherman arrived in the neighborhood of Savannah, when Dahlgren immediately opened communication with him. On the 18th December the investment of that city by the army on one side and the navy on the other was accomplished. Savannah was occupied by Sherman on the 21st. Early in January,

1865, the forces under Dahlgren assisted in transferring the right wing of Sherman's army to Beaufort, S. C. On the 12th and 13th February a joint army and navy movement was made along the approaches from Bull's Bay to Mount Pleasant with a view to threaten Charleston, which was evacuated on the night of the 17th, and Georgetown was soon after occupied by the navy. Rear-Admiral Dahlgren received the thanks of the Department for his untiring energy, etc., while in command.

East Gulf Blockading Squadron.—This squadron embraced within its limits the coast of Florida from Cape Florida to Pensacola. In January, 1862, Flag-Officer McKean, then in command, dispatched Commander Emmons in the "Hatteras" to operate against the enemy at Cedar Keys. The expedition destroyed a large amount of public property, including military stores, and captured several loaded schooners ready to run the blockade, and a battery of 2 guns in position at Sea-Horse Key. In the latter part of March, Commander Stellwagen, in the "Mercedita," arrived off Appalachicola with the "Sangamon," Lieut. Commanding Drake, and organized a boat expedition for the capture of a number of vessels above the city. No resistance was offered, and the expedition brought out a number of vessels and destroyed others. On the 4th of April, Lieut. Commanding Cate, in the "Pursuit," captured at St. Andrews a valuable side-wheel steamer of 500 tons with 200 bales of cotton. During the year 1863, the squadron, being then under command of Rear-Admiral T. Bailey, captured or destroyed more than 300 blockade-runners. In May, an expedition of several hundred, led by Confederate naval officers, made an attempt to capture, off Appalachicola, the U. S. steamer "Adela," which resulted in their complete discomfiture, the capture of most of them with several boats, their armaments and accoutrements. During the year many armed incursions were made into the interior of Florida, which resulted in the destruction of a number of salt-works. During the year 1864 the East Gulf Blockading Squadron engaged in no active operations against the enemy.

West Gulf Blockading Squadron.—On the night of the 12th April, 1861, Fort Pickens was reinforced by a party of U. S. troops under Capt. Vogdes, and by the marines of the squadron under Lieut. Cash. The "Brooklyn," Capt. Walker, and the "Wyandotte," Lieut. Commanding Mullany, were engaged in landing them. On the night of September 13, 1861, an expedition was fitted out, consisting of the first launch, and the first, second, and third cutters of the "Colorado," under the command of Lieuts. Russell, Sproston, and Blake, and Midshipman Steece, accompanied by Capt. Reynolds, of the marines, Assistant Surgeon Kennedy, Assistant Engineer White, and Midshipmen Forrest and Higginson. The entire force numbered about 100, including officers, sailors, and marines. The object of the expedition was the destruction of a schooner lying off the Pensacola Navy-Yard intended to be fitted out as a privateer, and the spiking of a gun in the southeast end of the yard. A desperate resistance was made, but the objects of the expedition were gallantly accomplished, the vessel was destroyed and the gun spiked. Our loss was 3 killed. Midshipman Higginson had the end of his thumb shot off, and Capt. Reynolds received a severe contusion in the shoulder. Handsome acknowledgments were made to those participating in this dashing enterprise. On the night of the 7th November, an expedition consisting of the first and second launches of the "Santee," under the command of Lieut. James E. Jouett, having with him Lieut. J. J. Mitchell, Acting Gunner William Carter, and Acting Master's Mate C. W. Adams, with 2 armed boats, left the "Santee," then blockading off Galveston, Texas, for the purpose of destroying the armed steamer "General Rusk," lying under Pelican Island fort. The armed schooner guarding the channel, and Bolivar and Pelican Island forts, were successfully passed without discovery, but the boats having grounded on Bolivar Spit, were discovered. Lieut. Jouett deeming it imprudent after being discovered to make an attempt upon a vessel so heavily armed as the "Rusk," concluded to abandon that portion of the expedition. In returning he boarded and, after a sharp and severe contest, in the commencement of which he was severely wounded, captured the schooner "Royal Yacht," armed with a light 32-pounder. Thirteen prisoners were captured, several stands of arms, and the colors. As the pilot of the expedition had been shot down, and the schooner had received a shot between wind and water, Lieut. Jouett concluded to burn her. After this the party returned to the frigate. Lieut. Jouett and Gunner Carter were seriously wounded, as were also 6 men, 2 of them mortally. Flag-Officer McKean issued a general order thanking the officers and men who composed the expedition, expressing the conviction "that their names would be enrolled by a grateful country among those who in former years have shed so bright a lustre upon the American navy." Jouett's intrepid conduct, and his indomitable will and courage, which, overcoming all obstacles, carried the enterprise to a successful conclusion, were acknowledged by the Department in his immediate appointment to an important command, and in a letter from the Department to Flag Officer McKean, which says, "The Department cannot in too high terms express its admiration of the daring and successful exploit of Lieut. Jouett, and the officers and men under him. The capture of a schooner well armed, and with every advantage of resistance, after a desperate encounter, speaks well of the intrepidity and bravery of the captors." On the 25th May, 1862, Lieut. Commanding Abner Read, in the "New London," had a spirited engagement off Pass Christian with the "Oregon" and "Pimlico," two of the enemy's armed vessels, which lasted 2½ hours, when they retired.

Capt. D. G. Farragut having been appointed to the command of the West Gulf Blockading Squadron, and charged with the reduction of the defenses guarding the approaches to New Orleans and the capture of that city, arrived at Ship Island on the 21st February, 1862, and at once commenced active preparations for that purpose. Eighteen thousand troops under Gen. B. F. Butler were to co-operate, and a fleet of mortar-vessels and armed steamers under Commander David D. Porter were to take part in the operations. The squadron for the purpose had been largely increased by many of the largest frigates

and sloops-of-war in the navy. Much difficulty was experienced in getting some of the former over the bar, and with the "Colorado" it was found impossible. On the 16th March, Porter with his mortar fleet, assisted by the gunboats, commenced the bombardment of Fort Jackson. On the 1st April, Capt. Bell, assisted by Lieuts. Caldwell and Crosby, who had been selected for the purpose, succeeded in cutting the chain placed in the river to obstruct our vessels. At 2 o'clock A.M., all preparations for the attack having been completed, signal was made to get under way. Owing to some difficulty with the "Pensacola" and some of the other vessels in getting their anchors, they were not under way for an hour later. The vessels then advanced in two columns, Capt. Bailey leading the right and the advance in the gunboat "Cayuga," Lieut. Commanding N. B. Harrison, followed by the "Oneida," Commander S. P. Lee; "Varuna," Commander C. S. Boggs; "Katahdin," Lieut. Commanding G. H. Preble; "Kineo," Lieut. Commanding Geo. M. Ransom; and "Wissahickon," Lieut. Commanding Albert Smith, supported by the steam-sloop "Pensacola," Capt. H. W. Morris, and frigate "Mississippi," Commander M. Smith. This division was to attack Fort St. Philip. The second division of the column was led by the "Hartford" (flag-ship), Commander Richard Wainwright, followed by the "Brooklyn," Capt. Thomas T. Craven; the "Richmond," Commander James Alden; and the second division of gunboats led by Capt. H. H. Bell in the "Sciota," Lieut. Commanding Edward Donaldson, followed by the "Iroquois," Commander John DeCamp; "Kennebec," Lieut. Commanding John H. Russell; "Pinola," Lieut. Commanding Pierce Crosby; "Itasca," Lieut. Commanding C. H. B. Caldwell; and "Winona," Lieut. Commanding E. T. Nichols, in the order named. The fleet soon passed the barrier chains, the right division attacking Fort St. Philip, and the left Fort Jackson. Commander Porter had by previous arrangement moved up to a certain point on the Fort Jackson side with his gunboats, while his mortar-vessels, with the "Portsmouth," engaged the water-batteries to the southward and eastward of Fort Jackson, and poured in a terrific fire of shells. A fire-raft was started down upon the "Hartford," in avoiding which the ship grounded, when the enemy's ram "Manassas" appeared, and pushed the raft down upon the "Hartford," setting her on fire half-way up to her tops. She was soon backed off and the fire extinguished. In the mean time, Fort St. Philip was soon silenced by the fire of the "Hartford." By the time the enemy's gunboats, reported to be 13 in number, besides the ironclads "Manassas" and "Louisiana," appeared, they were taken in hand and most of them destroyed. The fleet, with the exception of the "Winona" and "Kennebec," which were unable to pass the forts before the day broke, was now fairly past the forts, and the victory won. The "Varuna," which was some distance in advance of most of the fleet, was sunk. Just at the close of the fight the ram "Manassas" made a demonstration upon the "Hartford," when the "Mississippi" made after her, drove her ashore, and, pouring two broadsides into her, left her a perfect wreck. This closed the morning's fight. Capt. Bailey proceeded on and captured the Chalmette regiment. The fleet reached the English turn about 10 A.M. of the 15th. It was now formed in two columns as before. As Capt. Bailey in the advance approached the Chalmette batteries they opened a galling fire, but the larger vessels coming to his assistance opened, when the batteries were silenced and the troops driven out. New Orleans was shortly after taken possession of by Capt. Bailey, all the steamboats seized and sent down the river to bring up Gen. Butler's forces. Farragut then pushed on to Carrollton, where there were two other forts, which were found deserted. On the 28th April, Forts Jackson and Philip, after a bombardment of 144 consecutive hours by Porter's mortar fleet, surrendered to that officer. On the 29th, Gen. Butler reached New Orleans, and shortly after his troops were in full possession of the city. A detachment of smaller vessels, under Commander S. P. Lee, was sent as high as Vicksburg. Farragut, and Porter and his command, received the thanks of Congress. May 7, Commander James Palmer, in the "Iroquois," took possession of Baton Rouge with all the public property. On the 28th June the mortar-vessels commenced the bombardment of the Vicksburg batteries, which were soon silenced by this fire and that of the squadrons, but as there was not a sufficient land force to co-operate, the enemy soon returned to their guns. On the 2d July, Flag-Officer Davis, commanding the Mississippi Flotilla, joined Farragut above Vicksburg with a force of gunboats and mortar-vessels. On the 15th the enemy's ram "Arkansas" ran past the fleet and took refuge under the guns of Vicksburg. An unsuccessful attempt was made to destroy her. While the ironclad "Essex," Commander William Porter, and the gunboats "Kineo," "Katahdin," and "Sumter," were lying off Baton Rouge, a vigorous attack was made by the enemy on Gen. Williams's command, occupying that place, and the recapture attempted by a largely superior force led by Gen. Breckenridge, but were repulsed by the fire of the gunboats. The next morning, Commander Wm. Porter, in the "Essex," encountered the "Arkansas" a short distance above Baton Rouge, and after a short engagement the "Arkansas" was abandoned and blown up. The middle of September, Corpus Christi was occupied. Shortly after, Acting Master Francis Crocker, in the "Kensington," captured and took possession of the defenses of Sabine City. On the 4th of October, Commander W. B. Renshaw, of the "Westfield," having with him the "Harriet Lane," "Owasco," and "Clifton," after a feeble resistance, captured the city of Galveston and its defenses. On New Year's day, 1863, the gunboats holding the city were attacked by 4 of the enemy's vessels. The "Harriet Lane," after a desperate resistance, was carried by boarding. Wainwright, her gallant commander, was killed, and his executive, Lieut.-Commander Lee, mortally wounded. The "Westfield," in coming to her assistance, grounded, and, to prevent capture, Commander Renshaw blew her up,—that officer, Lieut. Zimmerman, Chief Engineer Green, and nearly a dozen men perishing with her. On the 11th of January the "Hatteras," a purchased vessel, Lieut. Blake commanding, was sunk by the enemy's steamer "Alabama," off the coast of Texas, where the "Hat-

teras" was stationed as a blockade vessel. In March, 1863, Farragut, with a strong force of vessels, attempted the passage of the Port Hudson batteries, but only the "Hartford" and "Albatross" succeeded. With them he approached Vicksburg, and opened communication with Rear-Admiral D. D. Porter, commanding the Mississippi Squadron, and Gen. Grant, both of whom were operating against that place. In attempting to pass Port Hudson the steamer "Mississippi" grounded and was destroyed. Upon this occasion the gallant and promising Cummings was killed. The navy now held control of the river between Vicksburg and Port Hudson, and, by establishing a blockade of the Red River, cut off the supplies from Texas destined to the use of the enemy. A naval force was always kept ready to co-operate with the army in the reduction of Port Hudson, and a continuous shelling of the place from mortar-boats, vessels, and a naval battery on shore was maintained. Nearly three thousand 13-inch shells were thrown into the works by the mortar-vessels, and the naval battery of 9-inch guns, used as a breaching battery, did good work. With the fall of Vicksburg, Port Hudson surrendered on the 9th of July. Military co-operation having been secured early in July, and 2 ironclads from the Mississippi and 2 from the James River having arrived, Farragut made his final preparations for the attack on the defenses of Mobile Bay. The ironclad "Tecumseh" arrived on the evening of the 4th of August, and everything being propitious, the attack commenced on the following morning. At 5.40 A.M. of the 5th of August the fleet moved in the following order, 2 abreast, and lashed together: "Brooklyn," Capt. James Alden, with the "Octorara," Lieut.-Commander C. H. Green, on the port side; flag-ship "Hartford," Capt. Percival Drayton, with the "Metacomet," Lieut.-Commander James E. Jouett; "Richmond," Capt. T. A. Jenkins, with the "Port Royal," Lieut.-Commander B. Gherardi; "Lackawanna," Capt. J. B. Marchand, with the "Seminole," Commander Edward Donaldson; "Monongahela," Commander James H. Strong, with the "Itasco," Lieut. Commanding George Brown; "Oneida," Commander J. A. Mullany, with the "Galena," Lieut.-Commander Clark H. Wells. The ironclad "Tecumseh," Commander T. M. Craven; the "Winnebago," Commander T. H. Stevens; the "Manhattan," Commander J. W. A. Nicholson; and the "Chickasaw," Lieut.-Commander G. H. Perkins, were under Sand Island, and had been ordered to take position on the starboard side of the wooden vessels, or between them and Fort Morgan, to keep down the fire of the water-battery, and to attack the ram "Tennessee" when the fort was passed. As the attacking vessels, in order of battle, moved steadily up the main channel and neared Sand Island, the monitors weighed anchor and took up their assigned positions. At 6.47 A.M. of the 5th of August the "Tecumseh," the leading monitor, fired the first shot. At 7.06 the fort opened upon the fleet, when the action became general, the vessels firing as their guns could be brought to bear. The leading vessel, the "Brooklyn," had barely passed Fort Morgan when the "Tecumseh" struck a submarine torpedo and sunk instantaneously, carrying down her commander, the noble Craven, and most of her officers and crew. A boat dispatched from the "Metacomet," Capt. Jouett, rescued 12 of the survivors, who were brought on board the monitor "Winnebago," within 200 yards of the fort. Mr. Nields, a volunteer officer in charge of the boat, won distinction and honor by the gallantry he displayed upon this occasion. With the sinking of the "Tecumseh" the "Brooklyn," the leading vessel, stopped, and in doing so without notice threw the wooden vessels out of line and into a confused and helpless condition, which the enemy took advantage of, and poured in a destructive fire from the forts and vessels, to which the monitors alone were enabled to reply. Farragut at once comprehended the situation, and when Alden reported a heavy line of torpedoes ahead, the quick response came, "Damn the torpedoes! Four bells,—go ahead, Capt. Drayton." And responsive to the will of her master, the grand old "Hartford" dashed by the "Brooklyn," straightened out the line, restored the fortunes of the day, and swept proudly on to victory. A little after 8 o'clock, Buchanan, in the ram "Tennessee," made a dash at the "Hartford," who took no other notice of her than to pour in a broadside. In the mean time the enemy's gunboats (particularly the "Selma") lying athwart the channel poured in a raking fire upon the advancing vessels, and inflicted considerable damage. Jouett was ordered to cast off and go in pursuit; he was after her in a moment, and in an hour's time had her as a prize. The "Morgan" and "Gaines" escaped under the guns of Fort Morgan,—the latter so badly injured that she sunk shortly after. During the night the "Morgan," chased and fired upon by the "Winnebago," escaped to Mobile. At 8.45, as the vessels were about to anchor, the ram "Tennessee" was perceived making for the fleet. The vessels most adapted to the purpose, with the monitors, were ordered to attack her, not only with their guns, but to run her down. The "Monongahela," Strong, was the first vessel that struck her, without doing much injury; the "Lackawanna," Marchand, going at full speed, also struck her, the only effect being to give her a heavy list; the "Hartford" struck her a glancing blow, pouring in at the same time, within 10 feet of her casemates, a broadside of 9-inch solid shot; the monitors delivered their fire as opportunity offered. Immediately after the collision with the flag-ship, Drayton, in the "Hartford," was directed to bear down for the ram again, and was doing so at full speed when the "Lackawanna" ran into the "Hartford" and cut her down to within 2 feet of her water-line. Just at this time the ram was sorely beset; the "Chickasaw" was pounding away under her stern, the "Manhattan," not far distant, and the "Ossipee" and "Winnebago" near at hand, approaching at full speed, while the "Monongahela," "Lackawanna," and "Hartford" were bearing down determined upon her destruction, when she hauled down her colors, ran up the white flag, and surrendered. In coming out to attack the fleet the ram made for the "Oneida," when the interposition of the "Winnebago" compelled her to sheer off.

On the following day the "Chickasaw," Perkins, shelled Fort Gaines with such effect that Col. Anderson, the commanding officer, capitulated. On the 22d August a bombardment was opened

from the shore batteries, the monitors, and one or two of the wooden vessels upon Fort Morgan, which unconditionally surrendered to the navy and army on the 23d. Fort Powell was abandoned on the night of the 5th and blown up. The capture of these forts closed the port against all illicit trade with the enemy. Indications that the enemy were about to evacuate the city led to a naval reconnoissance, consisting of 4 monitors. This movement drew such a fire as to show the defenses were still intact. A joint movement by land and water was arranged between Rear-Admiral Thatcher, in command of the naval forces after Farragut's departure North, and Gen. Canby, commanding the land forces, for the capture of Mobile. The troops were landed, on the 21st March, on the left bank of Fisher's River and pushed forward, while the naval vessels shelled the woods and co-operated by signal with Gen. Canby. In crossing the bar of Blakely River the monitors "Milwaukee" and "Osage" and 4 wooden gunboats were sunk by torpedoes. Beyond this and the loss of a few lives no serious consequences attended the capture of Mobile. Fort Alexis and Spanish Fort, after a short but severe bombardment, were captured on the morning of the 9th April, and with them about 2000 men and 16 heavy guns. Batteries Tracy and Huger were evacuated on the evening of the 11th. On the 12th all the remaining defenses were found abandoned. The works which surrounded Mobile were of great strength and extent. Nearly 400 guns of the heaviest calibre fell into our hands. The city was surrendered to Admiral Thatcher and Gen. Granger. On the 10th May, Farrand surrendered all the enemy's naval forces in the waters of the Alabama. Sabine Pass and Galveston soon after surrendered, and the supremacy of the government was established on the entire coast from Maine to Texas.

Mississippi Squadron.—Commander Andrew H. Foote having been appointed to the command of the Mississippi Flotilla, the first important operation was the attack and capture of Fort Henry, on the Tennessee River. At 12.30 P.M. on the 6th February Commander Foote commenced the bombardment of the fort. The attacking force consisted of the flag-ship "Cincinnati," Commander Stemble; "Essex," Commander W. D. Porter; "Carondolet," Commander Walke; "St. Louis," Lieut. Commanding Paulding; "Conestoga," Lieut. Commanding S. L. Phelps; "Tyler," Lieut. Commanding Gwinn; and "Lexington," Lieut. Commanding Shirk. Fire was opened at 1700 yards' distance by the flag-ship, followed by the other vessels, and continued until within 600 yards of the fort. In an hour and a quarter Gen. Tilghman, in command, surrendered the fort and his forces to Flag-Officer Foote. Gen. Grant arrived about an hour afterward, when they were turned over to him. Lieut. Commanding Phelps, in the "Conestoga," with the "Tyler" and "Lexington," proceeded up the Tennessee River as far as Florence and captured the steamer "Eastport," which the enemy were converting into a gunboat, and took several other prizes. From Fort Henry Flag-Officer Foote proceeded with a portion of his command up the Cumberland to attack Fort Donelson. On the 14th February, with the ironclads "St. Louis" (flag-ship), "Carondolet," "Louisville," and "Pittsburgh" and the wooden gunboats "Conestoga" and "Tyler," he engaged the fort and water-batteries. After a severe fight of an hour and a half, during which the flag-officer was seriously wounded, and when he was on the point of enfilading the fort and the enemy's fire had slackened, the "St. Louis" and "Louisville" were disabled in their steering-gear, when the vessels retired for the night. The enemy were so demoralized they could not be brought into effective action the next day, and the fort surrendered to Gen. Grant, commanding the military forces. With the "Conestoga" and "Cairo" Foote ascended the Cumberland, and on the 19th seized Clarksville and the 3 forts which defended the city and river. On the 4th March a force of gunboats convoying transports conveying troops moved upon Columbus, on the Mississippi River. When the national forces arrived the forts, of unusual strength, were found unoccupied. On the 14th, Foote, with a force of 10 ironclads and 10 mortar-boats, joined, at Columbus, by Col. Buford with 1500 troops, moved down and took possession of Hickman. The next day, arriving in the vicinity of Island No. 10, the mortar-vessels were placed in position and shelled out several encampments. A siege of 23 days followed, during which a canal was cut to admit the light transports to reach Pope with his army at New Madrid, below Island No. 10, and enable him to cross to the Tennessee shore. A formidable battery was spiked and a floating battery protecting the channel shelled out, to enable the "Carondolet" and "Pittsburgh" to run the blockade, which they did at night in a heavy thunder-storm under a terrific fire from 47 guns. Several batteries, erected to prevent Pope's command from crossing, were demolished by the 2 gunboats, and the landing was effected. This accomplished, the enemy surrendered Island No. 10 to the commander of the naval forces. One gunboat, 4 transports, immense munitions of war, and many prisoners fell into our hands by this important capture. Proceeding to Fort Pillow, Foote was joined by Pope and his army; while in the act of making a combined attack upon this fort the troops were ordered to Corinth. Flag-Officer Foote, suffering from his long-neglected wound, on the advice of the surgeons was relieved in command of the flotilla by Capt. C. H. Davis in the early part of May. On the 11th May the flotilla was attacked near Fort Pillow by 8 of the enemy's ironclad steamers, 4 of them fitted as rams. The action continued for an hour, when the enemy retreated under the guns of Fort Pillow, 3 of their gunboats having been disabled. Shortly after the ram fleet under Col. Ellet joined Davis, and on the 5th June Fort Pillow was abandoned. On the evening of the 7th the fleet anchored a mile and a half above Memphis. The next day an attack was made upon the enemy's gunboats and rams lying opposite the city. Ellet with his rams pressed into action under full steam, the gunboats in the mean time keeping up a well-directed fire. Two of the enemy's gunboats blew up, and the "Queen of the West," commanded by Col. Ellet in person, encountered the "General Lovell" and sunk her. A running fight followed, resulting in the capture or destruction of the enemy's entire fleet, except the "Van Dorn," which escaped. Memphis

was surrendered and taken military possession of by Col. Fitch.

On the 20th of July, Davis, with a part of his command and 6 mortar-boats, joined Farragut above Vicksburg, where the latter officer, with some of his squadron, had arrived a few days before. The mortar-vessels of both commands bombarded the defenses of Vicksburg for some days from both above and below. On the 18th of July, in the mouth of the Yazoo River, a severe conflict occurred between the enemy's ironclad ram "Arkansas" and the gunboats "Carondolet" and "Tyler," which resulted in the escape of the "Arkansas," which vessel succeeded in passing through the fleets of Farragut and Davis and finding refuge under the batteries of Vicksburg. In August a joint expedition up the Yazoo under Flag-Officer Davis and Gen. Curtis was successful; a battery of heavy guns and quantities of munitions of war were captured. A detachment from the squadron under Commander A. H. Kilty, with the 46th Indiana Regiment under Col. Fitch, left Memphis for White River on June 13 to form a junction with Gen. Curtis. On the morning of the 17th an attack was commenced by the gunboats on the enemy's fortifications near St. Charles, Ark., when Col. Fitch landed to assault the rear. The front battery was carried by the gunboats, and Fitch gallantly charged the second battery and carried it without loss. A shot exploded the steam-drum of the "Mound City," killing and wounding a large portion of her officers and crew. The "Tyler," Lieut. Commanding Gwinn, and "Lexington," Lieut. Commanding Shirk, of the Western Flotilla, preceded the march of the army southward on the line of the Tennessee River, and rendered service in convoying transports, clearing the banks of batteries, and in frustrating the attempts of the enemy to fortify. At Shiloh the services of these vessels were of great value in restoring the fortunes of the day. In September, 1862, Flag-Officer Davis was relieved in command by Rear-Admiral David D. Porter, who, with his characteristic energy, at once began active operations against the enemy. In the month of November, Capt. H. Walke, in the "Carondolet," commanded an expedition of ironclads and wooden gunboats up the Yazoo River, during which the ironclad "Cairo" was sunk by a torpedo. A few days after Porter arrived at the mouth of the Yazoo, and led an expedition up the river to clear the channel of torpedoes and to draw a portion of the enemy from Vicksburg to the defense of the river. By the 26th of December the river was cleared of all obstructions up to where the "Cairo" was sunk. On the 27th the expedition arrived at a bend in the river where a line of fortifications commenced, and the river was obstructed by a heavily iron-plated raft. While the boats were engaged in clearing the river the flag-ship "Benton," Lieut.-Commander Gwinn, moved up to cover them. She was struck some 30 times, and many of her crew were killed or wounded,—among the latter her commander, mortally. The other vessels handsomely supported the flag-ship, two of the guns in the fort were silenced; the enemy's works could only have been captured by a strong landing-party.

On the 4th of January, 1863, Gen. McClernand having requested the co-operation of Admiral Porter in an attack upon Arkansas Post, the "Baron de Kalb," Commander Walke; "Louisville," Lieut. Commanding Owen; and "Cincinnati," Lieut. Commanding Bache, with a number of light-draft vessels, were detailed for the purpose. Rear-Admiral Porter, in the flag-ship "Black Hawk," accompanied the expedition. After a battle of two days, Col. Dunnington, the commander of the fort, surrendered to the army and navy, yielding his sword to Admiral Porter; 17 heavy guns and a large number of troops were captured. On the day after, Commander Walke, with a force of gunboats, proceeded up White River. On the 14th the town of St. Charles was found evacuated. At Duvall's Bluff he landed a party and took possession of 2 fine 8-inch guns and about 200 stand of arms and accoutrements. At 4.30 A.M., February 2, the ram "Queen of the West," Col. Charles E. Ellet, ran the Vicksburg batteries, with orders from Porter to capture or destroy the enemy's transports between Vicksburg and Port Hudson. Col. Ellet arrived at the Red River, capturing and destroying on his way several fine transports. The "Queen of the West" then returned to the vicinity of Vicksburg. A few days later, she steamed down and entered the Red River. On the 13th of February, Lieut. Commanding George Brown, in the "Indianola," ran the batteries of Vicksburg with orders to join the "Queen of the West." Shortly after intelligence was received of the destruction of the "Queen of the West" in Red River, and that the "Indianola" had been sunk in the Mississippi. They had destroyed a large amount of the enemy's property. In March a daring and novel attempt was made by Porter to get into the rear of Vicksburg. By ascending Steel's Bayou, which is merely a ditch, he was hopeful, by cutting a way through the woods and widening the channel, he could find an entrance into the Yazoo River, and here effect his object. When Porter arrived within a short distance of Rolling Fork, he found the channel impracticable, and was forced to return. The expedition penetrated into the heart of the enemy's country before being discovered, when large quantities of cotton were destroyed. An attempt was made by Lieut.-Commander Watson Smith, with a detachment of gunboats, to secure control of the Coldwater, Tallahatchee, Yallabusha, and Yazoo Rivers, which would have opened the way to the capture of Vicksburg, as most of the enemy's supplies were received through these streams. Owing to the want of troops to co-operate the object of the expedition failed, although several steamers and 5000 bales of cotton were destroyed. The "Switzerland" and "Lancaster," in attempting to pass the Vicksburg batteries to join Farragut at Port Hudson, were both sunk, and many of their officers and crews killed or wounded. On the 16th of April, 1863, the fleet led by Porter, who had hoisted his flag on board the "Benton," ran past the Vicksburg batteries. The vessels started in the following order, 50 yards apart: "Benton," Lieut.-Commander Green; "Lafayette," Capt. Walke, with the "Gen. Price" lashed on the starboard side; "Louisville," Lieut.-Commander Owen; "Mound City," Lieut. Wilson; "Pittsburgh," Acting Volunteer Lieut. Hoel; "Carondolet,"

Acting Lieut. Murphy; and "Tuscumbia," Lieut.-Commander Shirk, with 9 army transports. Nearly all the vessels took in tow barges containing each 10,000 bushels of coal, and all passed the batteries in safety. On the 29th of April, Porter, with most of the armed vessels that had passed the batteries, bombarded for 6 hours the formidable works at Grand Gulf. At 6 P.M. the transports containing a detachment of Gen. Grant's command passed down under cover of the fire. On the 3d of May, Porter, with 4 ironclads, proceeded to Grand Gulf to attack the forts, but found them evacuated; before leaving the enemy had destroyed all the ammunition and spiked the guns. Next to Vicksburg this was the strongest position on the Mississippi. Its occupation greatly facilitated Grant's operations in reducing Vicksburg.

On the 29th April, Lieut.-Commander Breeze, with the "De Kalb," "Choctaw," and "Tyler," made a feigned attack upon Haines' Bluff in co-operation with a division of the army under Gen. Blair, to prevent the enemy from sending reinforcements to Grand Gulf. The desired effect was accomplished. In the early part of May, Porter proceeded up the Red River as far as Alexandria, which he took possession of and held until Gen. Banks arrived. On the 15th he crossed over to Yazoo River to be ready to co-operate with Gen. Grant. On the 18th, the firing in the rear of Vicksburg indicated the approach of Grant. The cannonading was kept up furiously for some time, when Porter discovered a company of artillery advancing, taking position, and driving the enemy before them. Gen. Sherman's division had come in to the left of Snyder's Bluff, and the enemy had been cut off from joining the forces in the city. The "De Kalb," "Choctaw," "Linden," "Romeo," "Petro," and "Forest Rose," under Lieut.-Commander Breeze, were sent up the Yazoo to open communication with Gen. Grant and Sherman. This they succeeded in, and in 3 hours Porter received letters from Grant, Sherman, and Steele, informing him of their successes, and asking that provisions be sent up, which was at once done. In the mean time, Walker, in the "De Kalb," pushed on to Haines' Bluff, which was found evacuated, and took possession of the guns, tents, etc., which were found in good order. The works were destroyed. Upon this being reported to Porter, he sent up a force of gunboats from below Vicksburg to fire at the hill batteries, which was kept up for 2 or 3 hours. At midnight they moved up to the town and opened upon it for an hour, and continued at intervals during the night to annoy the garrison. On the 19th, 6 mortars were placed in position, with orders to fire rapidly day and night. On the evening of the 21st, Porter received a communication from Grant stating he intended to attack the whole of the enemy's works at 10 A.M. the next day, and asking the admiral to shell the batteries from 9.30 P.M. until 10.30 A.M. The mortars were playing rapidly on the town and works all night, and the "Benton," "Mound City," and "Carondolet" went up and shelled the water-batteries and other places where troops might find rest during the night. At 7 A.M. the "Mound City" proceeded across the river and made an attack on the hill batteries opposite the canal. At 8 o'clock, Porter joined her with the "Benton," "Tuscumbia," and "Carondolet." All the vessels opened on the hill batteries, and finally silenced them. The "Benton," "Mound City," and "Carondolet" then closed with the water-batteries, leaving the "Tuscumbia"—out of repair—to keep the hill batteries from firing on the vessels after they had passed by. The water-batteries opened furiously, supported by a hill battery on the starboard beam of the vessels. The ironclads advanced to within 280 yards and returned the fire without cessation, the enemy's fire being accurate and incessant. The vessels having been engaged an hour longer than Grant requested, and all having received shots under water which could not be stopped while under way, withdrew in a cool and handsome style. After dropping back it was found the enemy had taken possession again of one of the lower hill batteries and was endeavoring to remove his guns, and had mounted a 12-pounder field-piece to fire at Gen. McArthur's troops that had landed a short time before. The "Mound City" and "Carondolet" opened fire and drove them off in a few minutes. On May 27, Porter, at the urgent request of Grant and Sherman, being led to believe the enemy had removed his guns to the land side, fitted the "Cincinnati" for the occasion by packing her with logs and hay, and sent her down to shell some works retarding the progress of the army. At 8.30 the "Cincinnati" left her anchorage and stood for the position assigned her. The enemy fired rapidly from all their guns, including those which were supposed to have been removed to the land side. The fire was very accurate, striking the "Cincinnati" almost every time, and passing entirely through her protection of iron, hay, and wood. Finding his vessel would sink, Lieut. Bache ran up stream as far as circumstances would allow, ran his vessel ashore, and succeeded in saving his wounded. She sank within range of the enemy's batteries, in about 3 fathoms' water. Her fire, until the magazine was drowned, was effective. Lieut. Bache received the thanks of the Department for his brilliant conduct on this occasion. On the night of June 19, Porter was notified by Grant he intended to open a general bombardment on the city at 4 A.M., and continue it until 10 o'clock. Commander Woodward, of the "General Price," received orders from Porter to move up with the "Mound City" and "Benton" and attack at the specified time. Lieut.-Commander Ramsay was given charge of a 100-pounder rifle, a 10-inch gun, and a 9-inch gun, fitted on scows, and placed them after midnight close to the point opposite Vicksburg protected by the bank. At the appointed time all the shore batteries opened fire, and also the guns on the scows and mortars. A little later the gunboats opened and kept up a heavy fire, advancing all the time and throwing shells into all batteries along the hills and near the city. There was no response,—the batteries were all deserted. At 10 o'clock the vessels and mortars ceased firing.

On the 4th July, Vicksburg surrendered to Gen. U. S. Grant. On the 7th June, Porter learning that a force of the enemy of about 4000 men were about to attack Milliken's Bend, where a quantity of military stores were kept, guarded by two colored regiments and part of the 29th Iowa, the "Choctaw" and "Lexington," under Lieut.-Commander Ramsay, were dispatched to protect

them. The enemy attacked before daylight. The colored troops met the onset courageously, and a company of the Iowa regiment stood their ground until they were slaughtered to a man, killing an equal number of the enemy. The fight was desperate, and the troops overpowered were driven behind a bank near the water's edge, pursued by the enemy. When the gunboats opened on the enemy with shell, grape, and canister they fled in wild confusion. Upon the fall of Vicksburg Porter received letters of congratulation from Sherman and the Navy Department, acknowledging the powerful co-operation of the navy under his command, and its great services during this memorable campaign. The fall of Vicksburg is referred to by Sherman in his terse style as a "victory won by the united navy and army of our country." Porter was made a full rear-admiral, to date from the 4th July, the day Vicksburg surrendered. On the same day Helena, Ark., was attacked by 18,000 of the enemy. Gen. Prentice, the commander, defended the place with great skill and daring, but his small force of 3500 men were fast being overwhelmed, when Pritchett, in the gunboat "Tyler," came to his relief and changed the fortunes of the day.

Shortly after this the "Baron de Kalb," "New National," Kenwood, and "Signal," under Lieut.-Commander J. G. Walker, were sent to drive out from Yazoo City the command of Gen. Johnson, who was fortifying the place with heavy guns for the purpose of making it a depot for military supplies; 5000 troops under Gen. Frank Herron accompanied them. The army and navy made a combined attack, when the enemy fled, leaving everything in possession of the United States forces but 4 of their finest steamers, which they destroyed. The army pursued the enemy, captured many prisoners, 6 heavy guns, and all their munitions of war. One vessel, formerly a gunboat, was captured by the navy. Upon this occasion the "De Kalb" was destroyed by a torpedo. A force of gunboats under Lieut.-Commander Selfridge was sent about the middle of July into Red River. Many fine steamers, used by the enemy to transport troops, were captured. While these operations were in progress, the gunboats on the Tennessee and Cumberland were actively engaged. But for the energy and activity of Pennock, the fleet-captain and commandant at Cairo, and of Lieut.-Commanders Phelps and Fitch, the divisional commanders on these rivers, Rosecrans's army would have been without provisions. In July, Morgan, the famous guerrilla, with his command crossed the river into Ohio, and, hotly pursued by Gen. Judah, endeavored to recross. Lieut.-Commander Fitch intercepted him at Buffington Island, where Morgan and his band were captured by the army and naval forces under Judah and Fitch. In November, when Porter heard of Sherman's move from Memphis for Corinth, he assembled at the mouth of the Cumberland and Tennessee a suitable force of vessels. Though the water was low, Fitch succeeded in convoying the steamers with stores, so much needed by the army. A fortunate rise enabled Phelps with his gunboats to ascend the Tennessee as far as Eastport, and a few hours after his arrival Sherman reached Iuka. With the aid of the barges the troops were ferried over in an incredibly short time by the gunboats, and Sherman was thus enabled to bring his formidable corps into action before Chattanooga. Later the transports were convoyed with provisions, and the gunboats held Eastport, thus protecting the communications until Grant ordered its evacuation and the troops sent to Columbus, where they arrived safely under convoy of a force of gunboats. On the 1st of March a force of gunboats was sent under Lieut.-Commander Ramsay up the Black and Washita Rivers. The enemy, 2000 strong, under Gen. Polignac, were driven from point to point, some extensive works destroyed, and three heavy 32-pounders captured. On the 7th of March, Porter had assembled at the mouth of the Red River a formidable fleet of ironclads and light-draft vessels. The fleet were joined at the mouth of the Red River by a portion of Sherman's army, in transports, under Gen. A. J. Smith. The joint forces moved on the 10th of March to form a junction with Gen. Banks at Alexandria. On their way some of the vessels branched off into the Atchafalaya. The enemy were driven from Simmsport and Fort De Russy, the latter being again captured, with its guns, munitions of war, and a few prisoners. Alexandria was occupied by the combined forces about the 1st of April, when they commenced to move towards Shreveport. Only a part of the naval force could proceed farther than Alexandria; but the assistance of the gunboats was so essential to success that extraordinary exertions were made to get above the falls. Grand Ecore was reached and occupied. There were indications of the usual rise in the river, and everything promised success, and 23 heavy guns had been captured since entering the river. Springfield Landing, the next point of junction, was reached at the appointed time by 6 gunboats and 20 heavy transports. Here they learned of Banks's reverse, and that he was falling back to Pleasant Hill, some distance below; Porter was thus compelled to turn back. On his return he was attacked at every assailable point, but the gunboats fought their way through, repelling at times their assailants with terrible slaughter. On reaching Grand Ecore, he found the vessels left there still detained. Instead of rising, the river had fallen. The army was preparing to move back upon Alexandria. There was little prospect of getting the vessels out, and destruction seemed inevitable. "Providence," as Porter says, "provided the man for the occasion" in Lieut.-Col. Joseph Bailey, acting engineer of the 19th Army Corps, who devised a plan for constructing a series of dams across the rocks at the falls, thus supplying a sufficient depth of water for the needed want. The dams were built, the project was a success, and the fleet was relieved from its critical situation. Rarely has the genius of man overcome such peril and difficulty. Bailey received the handsomest acknowledgments from Congress, and he was promoted for his great services. A division of vessels under Foster, while these operations were in progress, proceeded up the Washita as far as Monroe, and captured 3000 bales of Confederate cotton and destroyed much property. On the 25th of March the enemy attacked Paducah, and demanded its immediate surrender, threatening to give no quarter if refused. The gunboats "Peosta" and "Paw Paw," and Fort Hindman opened fire

upon them, and drove them back with great loss. Capt. Pennock, naval commander at Cairo, upon receiving information of the attack on Paducah, at once sent up additional vessels, and saved Columbus, Ky., and recovered Fort Pillow by his zeal and promptness in pushing forward reinforcements. On the 1st of November, Rear-Admiral S. P. Lee relieved Porter in command of the Mississippi Squadron, the latter after two years of arduous, exhaustive, and harassing service, having requested to be relieved.

In November, 1864, the light-draft vessels "Tawah," "Key West," and "Elfin," after a severe engagement of several hours with the enemy's batteries near Johnsonville, on the Tennessee, were burned to avoid capture. Lieut.-Commander Shirk, the division commander, adopted prompt measures to regain the control of the Tennessee lost through this cause, and in a few days was able to report the capture of several transports laden with the enemy's troops. On the 4th November, Gen. Hood was driven from Decatur, Ala., in which affair the gunboat "General Thomas" took a prominent part, receiving acknowledgments from Gen. Thomas for her efficient services. On the 3d December, Lieut.-Commander Fitch, commanding the tenth district of the Mississippi Squadron, defeated and drove from the Tennessee the left wing of Hood's army under Gen. Buford, with heavy loss to the enemy, including several prominent officers, and recaptured two transports. Early in December the gunboats "Vindicator" and "Prairie Bird" co-operated successfully with the army in destroying the enemy's railroad communications in Mississippi. The expedition also destroyed the bridge over the Big Black River, and captured a considerable amount of the enemy's stores.

Early in January, 1865, Admiral Lee was enabled to report to the Navy Department that Hood's army, completely demoralized, were retreating rapidly before the victorious force of Gen. Thomas. Under date of December 30, Gen. Thomas wrote a complimentary letter to Admiral Lee, in which he says, "Your co-operation on the Tennessee has contributed largely to the demoralization of Hood's army. It gives me great pleasure to tender to you, your officers, and men my hearty thanks for your cordial co-operation during the last 30 days." After the battle of Nashville, Gen. Steedman, of Thomas's army, was sent to retake Decatur. Lieut. Moreau Forrest co-operated, and the place, with the artillery there, was captured. On the 23d April, 1865, the enemy's ram "Webb" ran out of the Red River and continued on to a point 25 miles below New Orleans, where she was intercepted by the "Richmond," and run ashore and destroyed by those on board. In June, 1865, the enemy's naval forces in Red River surrendered to Lieut.-Commander Fitzhugh, of the "Ouichita."

West India Squadron.—In 1862 a force of vessels was fitted out, placed under command of Rear-Admiral Charles Wilkes, and sent to the West Indies, for the purpose of breaking up blockade-running to and from these islands; to capture the piratical steamers preying upon the commerce of the United States, and afford protection to steamers engaged in the California trade. With an insufficient force of unsuitable vessels, Admiral Wilkes, through his untiring energy, which he infused into all under his command, and by his skillful arrangements, made many valuable captures. The "Sonoma," Commander T. H. Stevens, a vessel attached to his squadron, while crossing the Bahama Banks from Cay Lobos to the Tongue of the Ocean, discovered and chased the Confederate steamer "Florida" for 34 hours through the Tongue of the Ocean, past Nassau and Northwest Providence Channel, 124 miles to sea. This was the sole instance, it is believed, during their career of destruction and devastation, in which either of these noted cruisers, the "Alabama" or "Florida," were sighted or seen outside of a harbor. While ample provisions were made by the government to establish and enforce the blockade of our extensive coast, from the Capes of Virginia to the Rio Grande, and to provide suitable vessels and means to attack and operate against the defenses of the enemy, the policy of the government in relation to the "Alabama" and "Florida," and vessels of a similar character, was one of absolute weakness. With full and timely warning of the intent of the Confederate government to depredate upon our commerce, no suitable provisions were made for its protection. Month after month, year after year went by, each day bringing intelligence of the doings of the Confederate cruisers; but no number of fast vessels were dispatched in search of them; no vessels built or purchased with speed and long-range guns as the first essentials to overhaul and destroy them. A steamer of ordinary speed was dispatched to Europe, one to Asia, and two or three in some other direction, and with these weak and spasmodic efforts the Navy Department seemed content. Admiral Wilkes, after continuing in command of the West India Squadron for about 18 months, was relieved by Rear-Admiral James L. Lardner, and shortly after the squadron was broken up.

Potomac Flotilla.—Early in 1861 a flotilla was organized and sent to the Lower Potomac to cut off communication between the enemy in Virginia and their coadjutors and sympathizers on the Maryland side, to prevent the erection of batteries on the Virginia side, and to give protection to the commerce of loyal citizens. In the heroic discharge of his duty, as previously noticed, the first commander of the flotilla—Commander James H. Ward—was killed at Matthias Point, on the 27th June, 1861. Capt. Thomas T. Craven succeeded Commander Ward, and remained in command until relieved, in the fall of 1861, by Lieut. R. H. Wyman. During the years 1864–65 Commander F. A. Parker commanded the flotilla. Upon the flotilla devolved the duty of patroling the Potomac and Rappahannock, and on all occasions the flotilla actively co-operated in the military movements. While the army was in the vicinity of Fredericksburg the services of the smaller steamers were of great value. The flotilla was disbanded on the 31st July, 1865.

Vessels on Special Service.—On the 8th November, 1861, Capt. Charles Wilkes, then in command of the "San Jacinto," while cruising in search of the privateer "Sumter," in the Bahama Channel, took from the English steamer "Trent" the Confederate ambassadors Mason and Slidell. The prisoners were retained and conveyed to Fort Warren, where they were given in

charge to Col. Dimmick, in command of that fortress. On Sunday, June 19, 1864, the "Kearsarge," Capt. John A. Winslow, after an engagement of 1½ hours, sunk the enemy's steamer "Alabama," of equal size. For particulars of this memorable engagement, see biographical notice of Capt. Winslow. Capt. Winslow was advanced a grade, and his executive, Lieut. James S. Thornton, who was the executive of Farragut's flag-ship, the "Hartford," in the passage of the forts on the Mississippi, was also advanced. His splendid and skillful handling of the "Kearsarge" in her fight with the "Alabama" deserved and received high praise. Thornton was always distinguished for high professional acquirements and dauntless courage. On the 7th October, 1864, the "Wachusett," Commander N. B. Collins, captured in the Bay of San Salvador, Brazil, the enemy's privateer "Florida." In May, 1865, after the fall of Richmond and the collapse of the Rebellion, the Spanish authorities of Cuba delivered the ironclad "Stonewall," lately a Confederate vessel, to the United States.

During the war of the Rebellion 4647 men and officers were killed. The number of vessels captured was 1149 of all kinds, including 139 small boats; the number sunk, wrecked, and otherwise destroyed was 355, including 96 boats, making a total of 1504,—amounting to $31,500,000,—much of which was British property engaged in unneutral commerce. Nearly all the captures of value were vessels built in the so-called neutral ports, and fitted out in the ports of the governments with which we had treaties and were on friendly terms, and who had pledged themselves to a strict neutrality. Three hundred and twenty-two naval officers threw up their commissions at the breaking out of the Rebellion and their places were filled by volunteer officers, many proving worthy of the trust reposed in them; and the additional want of officers required by the war was supplied from this source. The navy contained at the close of the war 51,500 seamen, and 7500 officers, of all grades; 6880 artisans, of all kinds, were employed at the different naval stations; 208 steamers were built during the war (since the 4th of March, 1861); 481 vessels were purchased, of which 313 were steamers, at a cost of $18.366,681; of these 340 have been sold for $5,621,800. By the Geneva award England paid to the U. S. government $15,000,000 for depredations committed upon our commerce by Confederate cruisers fitted out in its ports. On the 19th of June, 1866, the sloop-of-war "Sacramento," Capt. N. B. Collins, was wrecked on the reefs off the mouth of the Kathapalem, a branch of the Godavery River, in the Bay of Bengal. No lives were lost. In the autumn of 1866 intelligence was received that the American schooner "General Sherman" had been wrecked in the Ping-Yang River, Corea, and her officers, passengers, and crew murdered. The "Wachusett," Commander R. W. Shufeldt, on the 23d of January, 1867, was dispatched to investigate the circumstances, and to demand of the authorities the survivors, if any. No satisfactory answers were given to Commander Shufeldt. Information having been received of the wreck of the American bark "Rover" on the southeast end of the island of Formosa, and of the murder of all on board, Commander Febiger, in the "Ashuelot," proceeded to the locality to gather what information he could in reference to the affair, and to rescue the survivors, if any. He arrived in April, 1867, and required of the three different authorities an immediate investigation of the outrage. They claimed to be unable to bring to justice the perpetrators of the crime, who belonged to a horde of savages not obedient to their laws. Commander Febiger, with his limited force, deemed it unadvisable to resort to hostilities. Admiral Bell, in the "Hartford," with the "Wyoming," left Shanghai in the month of June for the purpose of destroying, if possible, the lurking-places of the savages who had murdered the crew of the "Rover." Arriving at the locality, a force of 181 officers, sailors, and marines, under Commander G. E. Belknap, accompanied by Lieut.-Commander A. S. Mackenzie, as second in command, —this officer having earnestly sought to go with the expedition,—they found the savages well armed and equal in courage to our North American Indians, who delivered their fire without being seen; owing to the high grass our men, in charging their coverts, fell into ambuscades. Upon one of these occasions the gifted, promising, and gallant Mackenzie was mortally wounded, and died before reaching the ship, lamented by all who knew him. Finding the inutility of further contending against a wily and brave horde of savages with men untrained to warfare of such a character, Belknap, about 2 P.M., wisely concluded to re-embark.

On the 1st January, 1868, Osaka and Hiogo, Japan, were quietly opened to foreigners. The harmony that prevailed on the opening of these ports was of short duration. Those opposed on the part of the Japanese broke out into open revolt. On the 27th January the contending parties came in conflict at Osaka. The tycoon, who was defeated, and who favored the extension of commercial intercourse, during the night of January 31, with some of his adherents, sought shelter on board the "Iroquois," and remained until morning, when the party went on board one of their war-vessels. On the 4th February, 1868, an assault was made by some Japanese troops at Hiogo on the foreign residents, during which one of the "Oneida's" crew was seriously wounded. All the foreign naval forces present united to protect the foreign settlement. On the 8th February a change of government occurred, when assurances were given to the U. S. legation that foreigners would be respected. The Japanese officer who ordered his troops to fire on the foreigners was executed in presence of a number of our naval officers, and of those of other nationalities. In April, 1868, Commander Febiger was again sent to the Corea to rescue, if possible, the crew and passengers of the "General Sherman," but on his arrival learned that none were alive. During the year 1868 the "Waterree" and "Fredonia" were destroyed by earthquakes on the western coast of South America. Twenty-seven officers and men were drowned on the "Fredonia." On the morning of the 29th October the "Saginaw," Commander M. Sicard, was wrecked on Ocean Island, in the Pacific Ocean. Officers and crew were saved through valuable assistance sent by the Hawaiian government, and a vessel sent by our commissioner, Mr. Pierce. Immediately after the disaster, Lieut. John G. Talbot and 5 others volunteered to

make the hazardous voyage to Honolulu, Sandwich Islands, a distance of 1500 miles, in a small boat to seek assistance. After a voyage of 31 days, during which they encountered terrible difficulties and dangers, and endured great suffering, they arrived on the 19th of December off Kanai, Sandwich Islands. They had previously lost their oars in a storm, and in attempting to land the boat capsized, and Lieut. Talbot and 3 others, already greatly debilitated, were drowned. William Halford, who alone survived, delivered Capt. Sicard's dispatches, upon the receipt of which the relief was at once dispatched. During the year 1871, Commander R. W. Shufeldt sent to the Department his report of and accompanying maps of the survey by the party under his command of the Tehuantepec route for a ship-canal. The survey for the Darien canal has been successfully completed by a party under Commander T. O. Selfridge, despite the great difficulties encountered in making way through the dense and almost impenetrable wilderness. He found the Atrato River, which he ascended 150 miles, navigable for vessels of the largest class the whole distance, with a width of 1500 feet and a depth of 30 feet. He reported that the actual length of the canal will be 31½ miles. Our government sent the "Worcester," "Supply," and "Relief" to Europe with supplies for the sufferers of the European war then raging. Our minister to China having been instructed to arrange a convention for the protection of sailors and others shipwrecked on the Corean coast, Rear-Admiral John Rodgers, with the "Colorado," "Alaska," "Monocacy," "Benicia," and "Palos," proceeded to Bois anchorage, Corea, for that purpose, accompanied by our minister to China. Upon the arrival of the fleet, and after communications and visits from the local authorities, a surveying party was sent out to pass up the channel past the Corean forts. After being allowed to pass, the boats on their return were treacherously fired upon. The small vessels accompanying the party hurried into action, drove the Coreans from their works, and succeeded in rescuing them, with 2 men wounded. An explanation was immediately demanded. At the end of 10 days none being offered, on the 9th and 10th June an attack was made upon the Coreans, 5 of their forts were captured and destroyed, 50 battle-flags and 481 pieces of artillery were taken. Our losses were 3 killed and 10 wounded, among the former being Lieut. Hugh W. McKee, a dashing and courageous officer. Finding it impossible to conclude a peaceful treaty, the expedition left. In the year 1872, Commander R. W. Meade, in the "Narragansett," concluded a verbal treaty of peace and amity with the native chiefs of the Navigator Islands.

On the 18th June, 1875, the "Saranac," while proceeding to Sitka, in passing through the Seymour Narrows, was caught in a whirlpool and thrown on a sunken rock, and so badly injured as to sink in deep water soon after. On this occasion valuable assistance was rendered by direction of the officer commanding the English naval forces. Preparations for observing the transit of Venus having commenced in December, 1874, the expedition sailed during 1875, and the results of the observations were forwarded to the Department. Two expeditions were sent out this year to complete the surveys for a canal route across the Darien Isthmus: one, under Lieut. Frederick Collins, to survey the Napipi route; the other, under Commander E. P. Lull, to make a survey near the line of the Panama Railroad. During the past eight years no less than seven surveys, with a view to ascertain the most practicable route for a ship-canal to connect the Atlantic and Pacific Oceans, have been made; three of these have already been noticed. In addition, a route has been surveyed between the Chepo River and the Bluff of San Blas; another in the vicinity of Caledonia Bay; also, a route by the way of the Tayra River and the valley of the Atrato. An instrumental survey was also made and a route located *via* Urana River, the mouth of the Atrato River, and by way of the Napipi River to the Pacific. These surveys have been performed with great zeal, skill, and self-devotion, several of the distinguished officers employed having been seriously injured in health by protracted exposure in a sickly and pestilential climate. Much has been accomplished in the direction of deep-sea soundings. Commander E. G. Belknap, in the "Tuscarora," upon two successive cruises, ran lines of soundings in the Pacific, between California, the Sandwich Islands, and Japan, with a view of laying telegraph-cables between those countries. The soundings were taken by means of an apparatus the genius of Belknap had devised, and the merits of which have been acknowledged and have received the highest commendation at home and abroad; 483 soundings were taken on the first cruise; on the second 107 were made. He was assisted by Commander J. N. Miller. Deep-sea soundings have also been made between St. Thomas, West Indies, and Cape Henry, by way of Bermuda, in the "Gettysburg." During the year 1879 the "Tuscarora," Commander J. W. Philip, was engaged in important surveys in the Pacific; Commander T. O. Selfridge in surveying the river Amazon, etc.; and Lieut.-Commanders F. M. Green and C. H. Davis were engaged in completing the work of telegraphically determining the longitudes of the east coast of South America. A complete chain of telegraphic measurements has been made with great exactness for the first time from Greenwich to Buenos Ayres, establishing precisely the geographical positions of Lisbon, Madeira, Porto Grande, Pernambuco, Bahia, Rio Janeiro, Montevideo, Buenos Ayres, and Para, and surveys and explorations in the interest of commerce have been made by several vessels of the navy cruising in different portions of the world.

For the facts and incidents connected with this summary of the achievements of the navy acknowledgment is made to Cooper's "Naval History," the "History of the Rebellion" embraced in Hamersly's first edition of the "Records of Living Officers of the Navy," and Farragut's life by his son, all of which have been accepted as authority. To the part the navy has taken in the various expeditions in the interest of science and commerce only allusion has been made, as they form subjects for separate articles in this work. So also in regard to the Naval Academy, the Torpedo School, Ordnance Instruction, Experiments, and kindred subjects. Of the present condition of the navy little can be said. Since the close of the war of the Rebellion

nothing has been done by the government in relation to the contest which has been going on between ordnance and armor. Our policy seems wise in waiting for the final determination of the question before building heavily-armored vessels. In regard to ordnance the conditions are changed; and it is a lamentable fact, we have not in service a gun of sufficient power to penetrate the plating of even a moderately armored vessel, and, saving some converted guns and howitzers, not a breech-loader. It is to be hoped that Congress will speedily make appropriations to supply guns of the most approved type and construction for our vessels of war, to place us upon an approximate equality with other maritime powers. Time was when our ships of war attracted admiration wherever they floated, and filled with just pride the American heart. Pre-eminent in their day were the famous "Old Ironsides" and the "United States"; then the line-of-battle ships "Ohio" and "Pennsylvania"; later the sloops-of-war "Portsmouth" and "Plymouth"; and more recently the "Colorado," "Wabash," and "Minnesota," magnificent steam-frigates, full of power and grace and beauty. In their day and generation these were the model ships of the world, and the United States in this regard the leading naval power. How hard to realize this when we are so poor in ships to-day as to be compelled to send an admiral to represent the power and majesty of a nation of 50,000,000 of people, and to command a foreign squadron composed of two small vessels, with one of these corvettes for his flag-ship, and with half her captain's cabin for his accommodation!—*Thomas H. Stevens, Rear-Admiral U.S.N.*

NAVY, VOLUNTEER.—On account of the emergency created by the great Rebellion of 1861, a large increase in the number of officers of the navy became absolutely necessary. The number of vessels in the navy, of all kinds, on March 4, 1861, was 76; the number purchased during that year was 136, and the number constructed 52, making the total number of vessels in the navy, in December, 1861, 264, or 188 more than March 4, 1861; and the number of enlisted men was increased during the same period from 7600 to 22,000. This great increase of vessels and men required more officers than the navy at that period, weakened by the withdrawal of many officers of all grades to engage in the Rebellion, could furnish; hence the Secretary of the Navy, early in 1861, determined to appoint acting officers, or, as they were called, to distinguish them from regulars, volunteer officers. There were several sources from which this required supply of officers could be obtained: 1st, the officers who had, during time of peace, resigned; 2d, acting midshipmen who had resigned, before graduation, from the naval school; 3d, those persons who had formerly served in the navy as petty officers and enlisted men; 4th, pilots and men employed in the Western rivers; and, 5th, and by far the most prolific, the commercial marine. Those appointed from the commercial marine, while being good seamen, were not proficient in gunnery, and, besides, they lacked the advantages of naval training; therefore, they were generally ordered first for ordnance instruction and the requisite and proper training. Notwithstanding the stringent regulations for discipline peculiar to the navy, the military bearing and address required, and the disadvantages before referred to, the good services and record of these officers are attested not only by the large number of promotions, after examination, but by many promotions for gallantry in battle and for faithful service, and by the fact that after the close of the Rebellion 4500 were honorably discharged with the thanks of the Department, and many were admitted, after examination, to the regular navy and to the marine corps.

During the year 1861 there were appointed 23 acting lieutenants, 29 acting volunteer lieutenants, 562 acting masters, about 300 master's mates, 88 acting assistant surgeons, 93 acting assistant paymasters, 240 engineers, and 340 officers of all grades in the Mississippi Squadron (those in the Mississippi Squadron were mostly appointed early in the year 1862), a total of about 1700. The acting lieutenants were officers who had formerly served in the navy; the acting *volunteer* lieutenants had not previously served in the navy, at least not as commissioned officers. Master's mates having been, in many cases, appointed by commanding officers of navy-yards, squadrons, and vessels, under general authority from the Secretary of the Navy, considerable trouble is experienced in arriving at the precise number in that grade, but 300 is doubtless a fair approximation.

Between March 4, 1861, and July 24 of that year, all acting appointments were made as a "military necessity," without direct authorization of law, but the act of July 24 provided that the "temporary appointments made, or which may be made, by the Secretary of the Navy of acting lieutenants, acting paymasters, acting assistant surgeons, acting masters and master's mates are ratified and confirmed as temporary acting appointments until the return of the vessels in which they are respectively employed, or until the suppression of the present insurrection, as may be deemed necessary." In July, 1862, the Secretary of the Navy began appointing acting ensigns, and the act of March 3, 1863, legalized the appointments.

As the rank of all the acting officers (except master's mates) corresponded with that of regular officers of like grade, their pay was made the same. By the act of May 17, 1864, the appointments of acting commanders and acting lieutenant-commanders were authorized, and by the act of March 3, 1865, the appointments of acting passed assistant surgeons; and the same act directed that master's mates (or acting master's mates) should be styled mates, and also provided that mates could be rated from seamen and ordinary seamen, such rating not to discharge them from their enlistment. The rating of enlisted men as mates had, however, been previously authorized by the Secretary of the Navy under the Department circular of October 7, 1863.

It is entirely impracticable to give anything like a fair and correct history of the individual services of these officers of the volunteer navy; indeed, such history would necessarily be incomplete, and there would, doubtless, be "invidious distinctions." Many acts of personal prowess were not specially reported, and, in the hurry and confusion incident to the times, the gallantry and meritorious services of not a few were uninten-

tionally overlooked, or not properly recognized and rewarded. In the second year of the war (July 16, 1862) it was enacted that any person who shall have received, or shall hereafter receive, a temporary appointment as acting volunteer lieutenant, or acting master, in the navy from civil life, may be confirmed in said appointment in the navy, and placed in line of promotion from the date of said confirmation, if, upon the recommendation of the President, he receives the thanks of Congress for highly meritorious conduct in conflict with the enemy. Although no promotions were specially made under this act, there were many made for gallant and meritorious conduct, and at the close of the war a board was organized (act of July 25, 1866) for the examination of candidates from the volunteer for admission to the regular naval service. Any line-officer who had served two or more years in the volunteer service was allowed to appear before the board. The number of candidates summoned to appear before the board was 426, the number appearing was 305, and the number found physically, mentally, and professionally qualified was 64. The names of those thus found qualified, and also the names of those officers who held the rank of acting lieutenant and acting volunteer lieutenant-commander, are hereinafter given, as well as the names of those, of all grades, who were transferred from the volunteer to regular service, or to the marine corps.

Found Qualified for Admission into the Regular Service.

Name.	Rank for which found Qualified.	Remarks.
N. Mayo Dyer	Lieutenant	In service, as lieutenant-commander.
Francis M. Green	"	In service, as lieutenant-commander.
Edward Hooker	"	In service, as lieutenant-commander.
Henry H. Gorringe	"	In service, as lieutenant-commander.
Alonzo W. Muldaur	"	Lost (as lieutenant-commander) in the "Oneida," January 24, 1870.
Joseph S. Cony	"	Did not accept appointment.
Charles O'Neil	"	In service, as lieutenant-commander.
Edward S. Keyser	Master	In service, as lieutenant-commander.
Thomas Nelson	"	In service, as lieutenant-commander.
De Witt C. Kells	"	Dismissed (as lieutenant-commander) February 4, 1879.
Felix McCurley	"	In service, as lieutenant-commander.
John McGowan	"	In service, as lieutenant-commander.
Gerhard C. Schulze	"	Died (as lieutenant-commander) September 28, 1875.
Edwin H. Miller	"	Died (as lieutenant-commander) November 7, 1874.
Henry C. Nields	"	In service, as lieutenant-commander.
Thomas F. Wade	"	Retired list (as lieutenant-commander), November 3, 1877.
James G. Green	"	In service, as lieutenant-commander.
George E. Wingate	"	In service, as lieutenant-commander.
George R. Durand	"	In service, as lieutenant-commander.

Found Qualified for Admission into the Regular Service.—Continued.

Name.	Rank for which found Qualified.	Remarks.
Charles A. Schetky	Master	In service, as lieutenant-commander.
John K. Winn	"	In service, as lieutenant-commander.
Thomas M. Gardner	"	In service, as lieutenant-commander.
Charles H. Rockwell	"	In service, as lieutenant-commander.
Charles M. Anthony	"	In service, as lieutenant-commander.
James M. Forsyth	"	In service, as lieutenant-commander.
George F. Wilkins	"	Retired list (as lieutenant), October 31, 1879.
H. Walton Grinnell	Ensign	Resigned (as ensign), 1868.
Nicholas B. Willetts	"	Died (as ensign), March 23, 1868.
Gilbert Morton	"	Retired list (as ensign), February 14, 1874.
William P. Randall	"	In service, as lieutenant.
George B. Livingston	"	" "
John J. Brice	"	" "
F. Aug. Miller	"	" "
William H. Mayer	"	Died (as lieutenant) June 1, 1879.
Henry G. Macy	"	Died (as lieutenant) December 1, 1872.
Oscar W. Farenholt	"	In service, as lieutenant.
William B. Newman	"	" "
Andrew J. Iverson	"	" "
William T. Buck	"	Died (as lieutenant) July 20, 1874.
Joseph Marthon	"	In service, as lieutenant.
Edward T. Strong	"	" "
William J. Dumont	"	Resigned (as ensign) September 11, 1868.
William H. Brice	"	Died (as lieutenant) July 6, 1874.
William H. Webb	"	In service, as lieutenant.
Charles S. Coy	"	Did not accept.
Ezra Leonard	"	Died (as lieutenant) July 29, 1870.
David G. McRitchie	"	In service, as lieutenant.
Zera L. Tanner	"	" "
Joseph E. Jones	"	" "
William Welch	"	" "
Samuel Belden	"	" "
James H. Stimpson	"	Declined appointment.
Henry R. Baker	"	Retired list (as lieutenant), December 2, 1876.
Eugene W. Watson	"	In service, as lieutenant.
John F. Merry	"	" "
William W. Rhoades	"	" "
John C. Morong	"	" "
William C. Gibson	"	" "
William B. Arrants	"	Retired list (as master), May 23, 1870.
Thomas G. Grove	"	In service, as lieutenant.
Walter Sargent	"	Lost (as master) in "Oneida," January 24, 1870.
James A. Chesley	"	In service, as lieutenant.
William A. Morgan	"	" "
William L. Howorth	"	Resigned (as ensign) April 4, 1869.

Officers holding Appointment as Acting Lieutenant.

Name.	When Appointed.	How and when left Volunteer Service.
Thomas F. Wade	May 8, 1861.	Appointment revoked October 2, 1861, and appointed an acting volunteer lieutenant.
James Parker	" 8, 1861.	Trans. to regular service.
E. Y. McCauley	" 11, 1861.	" "
John S. Barnes	" 13, 1861.	" "
J. S. Neville	" 13, 1861.	Appt. revoked Nov. 12, 1861.
J. N. Quackenbush	" 13, 1861.	Trans. to regular service.
J. P. K. Mygatt	" 13, 1861.	Resign. Dec. 12, 1861 (sick).
R. T. Renshaw	" 13, 1861.	Trans. to regular service.

Officers holding Appointment as Acting Lieutenant.—Continued.

Name.	When Appointed.	How and when left Volunteer Service.
Edgar Brodhead...	May 13, 1861.	Promoted to acting volunteer lieut.-commander.
J. P. Sanford.........	" 13, 1861.	Trans. to regular service.
Thomas A. Budd...	" 13, 1861.	Killed in action, March 22, 1862.
Charles Weston.....	" 13, 1861.	Resigned August 16, 1861.
P. G. Watmough...	" 13, 1861.	Trans. to regular service.
J. Van Ness Philip	" 14, 1861.	Died September 3, 1862.
Robert A. Knapp...	July 27, 1861.	Resigned Nov. 18, 1861.
S. E. Woodworth...	Sept. 10, 1861.	Trans. to regular service.
R. Townsend.........	" 17, 1861.	" "
Edm. R. Colhoun...	" 24, 1861.	" "
R. W. Shufeldt......	" 25, 1861.	" "
S. J. Shipley.........	" 25, 1861.	Appointment revoked February 6, 1863 (sick).
De G. Livingston...	" 30, 1861.	Declined appointment.
Simon C. Mish.......	Nov. 23, 1861.	Dismissed Dec. 24, 1861.
C. H. Baldwin.......	Dec. 27, 1861.	Trans. to regular service.
Joseph C. Walsh...	Feb. 11, 1862.	Resigned May 1, 1862.
F. S. Conover........	Sept. 13, 1862.	" Aug. 11, 1863.
J. MacLeod Murphy	Dec. 4, 1862.	" July 30, 1864.
J. D. Danels	June 3, 1863.	Promoted to acting volunteer lieut.-commander.
E. C. Merriman.....	Sept. 25, 1863.	Trans. to regular service.

Officers holding Appointment as Acting Volunteer Lieutenant-Commander.

Name.	When Appointed.	How and when left the Service.
Joseph D. Danels...	May 18, 1864.	Trans. to regular service.
Edgar Brodhead...	Oct. 22, 1864.	Resigned March 2, 1865.
W. C. Rogers	" 24, 1864.	Hon. disch. July 18, 1866.

Other Volunteer Officers who entered the Regular Service.—From Acting Passed Assistant Surgeon to Passed Assistant Surgeon: Daniel C. Burleigh and Francis V. Greene.

From Acting Assistant Surgeon to Assistant Surgeon: John H. Austin, Joseph G. Ayres, George A. Bright, Henry W. Birkey, J. Wesley Boyden, Edward B. Bingham, Horatio N. Beaumont, Hosea J. Babin, Thomas R. Brown, John W. Coles, Elwood M. Corson, Joseph T. Cottrell, George S. Culbreth, Fredk. M. Dearborne, Henry A. Dauker, Isaiah Dewling, J. Milton Flint, George S. Fife, Leslie D. Frost, Edward Frothingham, Charles L. Green, James N. Hyde, William H. Jones, William T. Kemp, Fredk. Krecker, Jerome H. Kidder, Grenville B. Le Compte, William V. Marmion, Ernest D. Martin, Joseph W. Newcomer, Charles H. Page, Henry L. Plympton, Henry T. Percy, Jeremiah J. Page, William M. Reber, John S. Ramsay, William J. Simon, John D. Smith, J. Rufus Tryon, Adam Trau, Edmund C. Ver Meulen, George F. Winslow, William H. Wescott, Robert Willard, David V. Whitney, James Wilson, F. W. Wunderlich, Edward H. Ware, Robert A. Whedon, Holmes Wikoff.

From Acting Assistant Paymaster to Passed Assistant Paymaster: R. W. Allen, H. M. Meade, Frank Clark, A. D. Bache, D. B. Batione, W. F. A. Torbert, E. H. Cushing, L. A. Frailey, John H. Stevenson, T. L. Tullock, J. W. Fairfield, E. M. Hart, G. E. Hendee, M. B. Cushing, J. H. Bulkley, R. B. Rodney, J. S. Giraud, S. S. Wood, F. J. Painter, G. L. Mead, W. W. Woodhull, G. R. Watkins, D. P. Wight, H. T. Wright, D. A. Smith, C. A. McDaniel, F. H. Arms, John Furey, J. Linsly, F. T. Gillett, G. H. Griffing, E. Mellach, George W. Brown, Edward Sherwin, G. A. Robertson, J. H. Mulford.

From Acting Assistant Paymaster to Assistant Paymaster: Charles H. Eldredge, Richd. Washington, Rufus Parks, William W. Williams, Forbes Parker, George W. Beaman, Joseph T. Lisle, F. R. Curtis, W. H. Sells, C. S. Perley, W. S. Blunt, Charles Fairchild, C. E. Chenery, H. A. Strong, Jesse P. Woodbury, W. L. Darling, G. R. Martin, W. H. Anderson, W. C. Cook, G. S. Benedict, Theoron Merritt, G. R. Rand, W. N. Watmough, Worthington Goldsborough, G. DeF. Barton, W. R. Winslow, H. P. Tuttle, F. H. Hinman, R. P. Lisle, C. F. Guild, J. E. Tolfree, L. G. Billings, J. F. Hamilton, C. P. Thompson, F. H. Swan, J. J. Philbrick, S. T. Browne, A. W. Bacon, F. C. Imlay, R. S. McConnell, C. D. Mansfield, H. T. Skelding, C. W. Slamm, J. A. Berry, Joseph Foster, E. N. Whitehouse, John MacMahon, Theo. S. Thompson, William J Thomson, H. G. Colby, J. R. Carmody, J. B. Redfield, William J. Healey, Henry Gerrard, John F. Tarbell, I G. Hobbs, J. P. Loomis, H. T. B. Harris, H. C. Machette, C. H. Lockwood, A. T. Hubbard, C. E Boggs, Frank Bissell, H. T. Stancliff, A. H. Nelson, G. F. Bemis, F. C. Alley, G. H. Read, J. Q. Barton, A. J. Greeley, S. D. Hurlbut, H. A. Thompson, Jr., C A. Cable.

Officers of the Marine Corps who served as Volunteer Officers in the Navy: D. Pratt Mannix, Lewis R. Hamersly, Henry C. Cochrane, William S. Muse, Albert H. O'Brien.

From Acting Third Assistant Engineer to Assistant Paymaster: Stephen Rand.

From Acting Chief Engineer to Chief Engineer: J. Q. A. Ziegler.

From Acting Third Assistant Engineer to Second Assistant Engineer: Jabez Burchard, W. B. Bayley, J. P. Mickley, E. F. McElmell, W. H. Platt, H. E. Rhoades.

From Acting Second Assistant Engineer to Second Assistant Engineer: T. J. W. Cooper, Geo. Cowie, J. T. Smith.

From Acting Third Assistant Engineer to Third Assistant Engineer: George W. Baird, O. B. Mills, W. G. McEwen, H. L. Slosson, Harrie Webster, E. G. Allen.

As Boatswain: William Allen, W. S. Bond, Jeremiah Harding, Josiah B. Aiken, John H. Brown, T. S. Collier, W. G. Tompkins, F. A. Dran, John Smith, James Heron, James Nash, Joseph McDonald, Hallowell Dickinson, J. S. Sinclair, J. W. Simmons, Thomas Savage, C. E. Hawkins, Daniel Ward, Michael Hickey, W. Burditt, W. P. Burke, Edward Cavendy, Edwin Consey, Woodward Carter.

As Gunner: Felix Cassidy, James Hayes, D. W. Burroughs, Cornelius Cronin, W. T. Devlan, George Dunn, W. A. Ferrier, John Russell, C. B. Magruder, A. A. Phelps, C. H. Venable, C. A. Young, C. C. Neil, M. K. Henderson.

As Carpenter: Oliver W. Griffiths, E. D. Hall.

As Sailmaker: Thomas S. Gay.

Appointed from the Volunteer Navy to the Regular Navy on the Retired List: Henry C. Keene (as lieutenant), E. E. Bradbury (as master), L. R. Chester (as master), H. F. Moffatt (as master), Wesley W. Bassett (as master).

Appointed a Lieutenant in the Navy from Master's Mate: William B. Cushing.

The names of these volunteer officers of the higher ranks are given not because they were in all instances more conspicuous for gallantry and more faithful in their services than others of lower rank, but because the space allotted to this article renders it impossible to give the long roll of those worthy of mention. Nor should it be presumed that those admitted into the regular service were the only ones qualified therefor. A large majority entered the volunteer navy for the single and heroic purpose of giving their services, and, if need be, their lives, for the preservation of the Union. That object attained and the authority of the government re-established on land and sea, resignations in large numbers immediately followed, the volunteer deeming his work and duty done and the object for which he entered accomplished.

On May 1, 1865, the Rebellion being then practically ended, the work of reducing the volunteer navy was commenced. The Secretary of the Navy ordered that, in mustering out volunteer officers, all in the service on that date should be allowed one month's leave of absence for each year of service. On the 1st of January, 1865, there were 5278 volunteer officers of all grades in the navy, while on the 1st of January, 1869, there were but 170, and on the 1st of January of the year following only 111.

It was not, however, until July 15, 1870, that all acts or parts of acts authorizing the appointment of temporary acting officers of the navy, except as to assistant surgeons, were repealed. The authority of the Secretary of the Navy to retain any volunteer officers after the close of the Rebellion was given by the act of July 25, 1866, and the exercise of that authority was by the act made conditional upon its being required by the exigencies of the service.

The act of February 15, 1879, provided for the honorable discharge or transfer to the regular service, as might be determined, of acting passed assistant surgeons and acting assistant surgeons, and abolished the volunteer navy of the United States.—*J. E. Dow.*

NAVY OF THE SOUTHERN CONFEDERACY.—The history of the navy of the Southern Confederacy has yet to be written. This article does not aim at giving that history even in its most epitomized form. Our object is simply to notice briefly and cursorily the general character of that service, some of the embarrassments attending its creation, and a few of its more prominent operations, more especially those which may serve to illustrate the action and value of the new class of vessels which the South for the first time ushered into naval warfare.

The Southern navy was modeled precisely after that of the United States. The same articles of war and internal rules were adopted, and the same discipline, usages, and general routine prevailed. With all these accessories, the older officers, holding their accustomed rank and surrounded very much by their former familiar associates, might have had need at times to cast a glance at the flag overhead or at the gray they had donned in place of the blue to realize fully that they belonged to a new service, foreign and hostile to the one in which they had passed the better part of their lives.

This organization was working smoothly and efficiently when a sweeping change was made by an act of Congress passed in May, 1863, creating a new service styled the "provisional navy." The officers appointed to it were all taken from the older service, now contradistinguished as the "regular navy." The juniors were transferred *in toto;* the seniors were selected by the Secretary of the Navy: all maintained unimpaired their status in the old navy.

The vessels, with all their *matériel* and their entire crews, were next summarily transferred *en masse* to the new creation, and the regular navy, thus stripped of all its properties, was reduced to a small body of veterans still in the vigor of life, yet cut off from all participation in service afloat, and consigned to the comparative inaction of "shore duties," which, nevertheless, were shared in common with the provisionals.

This duplicate organization of a general service, which, despite its nominal partition, remained essentially one and the same, was attended with confusion, embarrassments, and even more serious objections, that after a year's trial led the chief of the bureau of detail to recommend that the transfer to the new service should be made to embrace all the officers indiscriminately; but high officials are seldom inclined to brook any interference with pet measures, and the suggestion found no favor.

About the same time another act was passed to establish what was called the "volunteer navy." The effect of this measure would have been to systematize privateering, and, by combining its forces under the guise of a new name into a national marine, to raise it to a higher level than could be attained by single and independent vessels sailing under the authority of letters of marque and reprisal. There is reason to believe that Congress was in some degree prompted to this course by the agreement which had been concluded between the maritime powers of Europe, in 1855, to place privateering *hors de loi*, for, though this agreement was only binding upon the parties assenting to it, its moral effect as a public expression of European sentiment tended to put that method of aggression under

ban and at discredit wherever practiced. The more immediate object, however, was to induce capitalists to invest in enterprises that promised swift and profitable returns, with the advantage to the government of despoiling the commerce of the enemy without cost to the treasury.

The law authorized the President to accept the services of armed vessels, furnished and equipped at the expense of the owners, to appoint officers, confer assimilated rank, define the rights and duties of those engaged in the ventures, and establish rules for the general government of the whole. But the statute was adapted rather to the genius of a commercial than an agricultural people, and met no hearty response. It is believed that no vessel was ever equipped for the service proposed.

There was yet another marine force, which is only noticed to dissociate it from the navy with which the historians of the day confound it. It was styled the "river defense," or more popularly "Montgomery's fleet," and consisted of a number of Mississippi steamboats, commanded and manned exclusively by river-men, and placed under the control of the War Department. These boats, with their engines protected by a barricade of cotton and their bows revetted with a plating of iron, were designed for the special purpose of running down and sinking the ironclads of the enemy. Part of the fleet was eventually destroyed by their own commanders after co-operating with the navy in the unsuccessful attempt to prevent the Federal fleet from passing Forts Jackson and St. Philip, in April, 1862, and the rest for the most part were captured or sunk during a hotly contested engagement with a superior force of ironclads off Memphis, in June of the same year.

It is no disparagement to the Confederate navy to say that it played comparatively a subordinate *rôle* in the war. The reason for this is obvious. At the outbreak of hostilities the South had no navy, in the proper sense of the term, nor did she possess at any time during the struggle a sufficient number of efficient vessels to cope with the powerful squadrons mustered along the entire coast. She had a body of valuable recruits of every grade in the naval officers who had resigned from the U. S. service, and a limited number of seamen and stokers who had been thrown out of employment by the stoppage of trade, but was destitute of ships, and before she had time to construct them found herself in the thick of the conflict. In this strait the government was driven to the usual expedient in such cases,—a wretched makeshift at best,—that of attempting to turn merchant craft into warships. But no ingenuity of the shipwright could achieve the transformation with such material as the dock-yards of the South afforded. Vessels like British mail-steamers, adapted in their original structure to war contingencies, or the stoutly timbered clipper-ships of New York might be proper objects for such conversion; but the South, with the exception of a few sea-going vessels picked up here and there, had to rely mainly on steamboats and steam-tugs, river barges, canal- and ferry-boats. The inadequacy of trumpery fleets made up of such material soon became evident.

When Dupont appeared with his large and well-appointed squadron off Port Royal in November, 1861, he found nothing to oppose him on the water but 7 small merchant craft improvised into war-ships, and commonly known under the derisive name of "mosquito fleet." They were under the command of Commodore Tatnall, who could do no more than hover on the outskirts of the enemy, and attempt ineffectually to interrupt the sounding-parties as they were feeling their way over the bar. Later, during the following February, Commodore Lynch found himself in a similar position. He was stationed on the sounds of North Carolina with orders "to hold those waters to the last extremity." To make good those brave words his pennant was floating over the same number of vessels of insignificant size that but a few weeks since had been river traders or canal-boats. When the Federals made their combined attack on Roanoke Island, on the 7th, he was confronted by 33 vessels of various descriptions, comprising 17 steam-gunboats armed with guns of the heaviest calibre, among which were 80- and 100-pounders. In the first action, conducted at long range, he lost two of his vessels,—one sunk and the other disabled. Two days afterwards the battle was renewed off Elizabeth City, and the small flotilla was well-nigh annihilated, one boat only escaping, which made its way through Dismal Swamp, the rest being captured by the enemy or blown up by their own commanders. On the Mississippi similar disasters overtook the same wretched class of vessels about the same time. Here, in February, 1862, Commodore Hollins was co-operating with the land forces with a force of 5 converted gunboats carrying in all 32 guns,—7½-inch rifles and 8-inch smooth-bores. These "shells," as they were facetiously called, answered pretty well for intercepting military transports or occasional brushes with the hostile batteries; but as yet they were separated by the formidable batteries on Island No. 10, at the bend of the river near New Madrid, from Foote's ironclads and mortar flotilla, the first alone mounting 75 guns in the aggregate, including 10-inch columbiads, 9-inch smooth-bores, and 100-pounder rifles.

They were not, however, fated to encounter that powerful fleet. Upon the fall of Island No. 10 they were dismantled of their guns, which went to strengthen the batteries of Fort Pillow, and in this defenseless state were finally burnt to escape capture on the approach of the Federal squadron from below.

Early measures were taken for forming a navy. A secret agent employed at New York was directed in March, 1861, to purchase vessels suitable for conversion into men-of-war. Soon afterwards an officer of the line, accompanied by a competent engineer, was sent for the same purpose to New York, Philadelphia, and Baltimore, and yet another envoy was dispatched to buy a certain steamer in Canada. All these efforts proved fruitless; the Canadian steamer, for some reason, could not be obtained, and the United States had forestalled the South by purchasing or chartering whatever was available in its own waters. Naval officers were also hurried to England and France, provided with ample funds to purchase ironclads, or, in default of this, to have them built, and to procure arms, ordnance stores, and supplies of all kinds. The hope of acquiring ironclads in this way must

have been prompted by the prevailing delusion of the moment that the great staple of the South would control the policy of those nations by forcing them into open hostilities in her behalf, or at least by inducing them to connive at the equipment of armaments in their ports. These hopes, as we all know, were not realized. The officers, being thus baffled in their first purpose, were instructed to have wooden vessels built in England for cruising on the high seas.

To accomplish this required secrecy, tact, and finesse of no common order. The English law known as the "Enlistment Act," passed under one of the Georges, prohibits, "under a penalty of fine and imprisonment, with forfeiture of property," the equipment of any vessel to be employed against the subjects or citizens of a state at the time in amity with England. To evade this act in the face of police authorities kept keenly on the alert by spies and detectives employed by the United States seemed almost a hopeless attempt; yet, in spite of every obstacle, the "Alabama," the "Georgia," the "Florida," and the "Shenandoah," which severally inflicted so much damage on the commerce of the United States, forcing almost the entire trade into foreign bottoms, were all built in British waters, from which, as soon as completed, they sailed openly under the English flag, bound to the appointed rendezvous of some lonely island, where they received their armament, hoisted the Confederate flag, and launched forth on their adventurous career.

The views of the Secretary of the Navy in regard to the character and extent of the naval preparations that were required to put the South on a good naval footing may be gathered from a communication addressed by him to the Executive under the date of March 2, 1862, for the information of Congress. In this document he states that there was or might be necessary during the current year "50 light-draft and powerful steam-propellers plated with 5-inch bar-iron and equipped for service in our own waters, 4 iron- or steelclad 10-gun frigates of about 2000 tons each, and 10 clipper-propellers with superior marine engines, both classes of vessels designed for deep-sea cruising." He desires provision made for "3000 tons of boiler- and plate-iron, 1000 tons of rod-, bolt-, and bar-iron, 3000 pieces of heavy ordnance ranging in calibre from 6 to 11 inches and in weight from 6000 to 14,000 pounds, 1000 tons of musket-powder for filling projectiles and pyrotechny, 4000 naval revolvers, and 4000 cutlasses with equipments and ammunition." To utilize this vast amount of material he requires "3000 seamen, 4000 ordinary seamen and landsmen, and 2000 mechanics."

Looking at the poverty of our internal resources and almost entire dependence for means and appliances for naval purposes on foreign supplies at the time this communication was penned, the project it unfolds would rather seem the Secretary's ideal of what the foundation of the Southern navy should be than a well-studied plan proper for legislative consideration. But that official was looked to by Congress for the initiation of its naval measures, and it was perhaps his wisest policy to present affairs under such an aspect as would inspire confidence and promote liberal appropriations. The suggestion of ironclads for sea-cruisers at the time seemed premature. The question of rendering that class of vessels capable of encountering the perils of the sea had not yet been solved by satisfactory tests. As the most advanced ship in that line of improvement, the representative vessel was the French frigate "La Gloire." She was the final product of the best French engineering science and skill which had been prosecuting its investigations through a succession of costly experimental structures, and it was claimed that she was as invulnerable to the storms of the ocean as to the shot of the enemy. The English, however,—better authorities on nautical subjects than their neighbors across the Channel,—denied the sea-going qualities of their crack ship.

But, accepting the Secretary's views as real and earnest, let us examine as briefly as may be some of the difficulties he had to encounter in the attempt to carry them out, and what finally was the outcome of his labors, which continued up to the last year of the war.

It will be readily seen that it was no easy task to create a navy in a country at once invested by sea and invaded by land, depending largely on foreign supplies for many of the most important materials, yet snatching them as it were from the chances of blockade-runners, and constantly compelled by the advance of the enemy to abandon or destroy vessels still on the stocks or retreat with others more advanced to safer points for completion. Thus the progress of the work was frequently checked and delayed, and much that had been accomplished at great cost rendered abortive. Gunboats in process of building were lost in this way by the capture of Nashville; 2 were destroyed on the ways when Norfolk was evacuated; some 10 or 15 in various stages of construction on the shores of the York and Pamunkey Rivers were sacrificed as the Confederates retired from the Peninsula; when Memphis was threatened one ironclad unfinished was hurried off to the upper waters of the Yazoo, and the torch applied to her consort still unlaunched; and the greatest loss of all was that of the "Mississippi," a powerful ironclad, destroyed when nearly completed, off New Orleans, to prevent her capture by the Federal fleet near at hand.

These were only some of the disasters arising from the cause stated. Had all of them been reckoned at the time, the sum-total might have created a fear that the work of demolition was fast overtaking that of construction.

Besides such reverses, the inadequacy of our resources beset the task of construction at the outset with endless hinderances. The South had two dock-yards only. That at Pensacola was too remote and isolated for the occasion. The Norfolk yard was a priceless acquisition, with its dry-dock, foundry, machine-shops, its stores of material and supplies and large amount of ordnance, but the facilities it afforded could only be utilized on the spot, while the necessities of the case required that the vessels should be built in every quarter.

The Tredegar Iron-Works, at Richmond, were the only ones in the whole Confederacy capable of casting guns of heavy calibre, until the government erected its own establishments at Charlotte and Selma.

In the entire Confederacy there was not a re-

liable establishment, except in Tennessee, where a first-class marine engine could be constructed. Three rolling-mills only existed in the whole country, two of which, in Tennessee, were unavailable owing to the disturbed condition of the districts in which they were located, and the third, at Atlanta, Ga., had to undergo extensive alterations, involving serious delay, before it could undertake the heavy work of the navy. The private machine-shops and foundries resorted to by the government in the absence of public establishments of the kind were everywhere more or less crippled by the loss of operatives, who had enlisted in the land service. The navy was especially pushed for skilled workmen to build its ships, and seamen to man them when built. Both of these classes had been largely absorbed by the army, which was unwilling to relinquish them. Laws passed for the recovery of them for naval uses became well-nigh inoperative from the complicate and dilatory processes of red tape and routine that hampered every effort to attain the object. Not more than one-tenth of those for whom application was made could be obtained, and these were mostly detailed for limited periods instead of being permanently transferred.

At the outset the navy was in pressing need of everything,—hemp, coal, iron, powder, ordnance, ordnance stores, medical supplies, provisions, clothing; in short, almost every article of prime necessity. Even the wood of which the vessels were built was generally standing green and flourishing in the forest when the contract which was to utilize it was signed.

To supply most of these wants the main reliance of the South, as already stated, was upon blockade-runners. All the Southern ports were busily engaged in these enterprises, much of their capital and energy, shut out from the usual fields of activity, being now concentrated in this one eager pursuit. Wilmington, N. C., took the lead, trading chiefly with Europe, but Charleston, Mobile, Savannah, and New Orleans had their full share in the new game of chance. Nor were other places less noted idle. Along the extensive Southern estuaries might be found here and there at some obscure inlet or sheltered cove an improvised settlement diligently prosecuting the same traffic, the vessel screened by a convenient headland tufted with trees, and the neighboring beach strewn with cotton in process of shipment, or perhaps piled with a freight just landed and worth now a hundredfold its cost, and all these busy doings going on with the watchers outside not a whit the wiser.

The Navy Department was soon itself compelled to become an active and direct participant in these ventures. When, from the exhaustion of its funds abroad and the depreciation of its currency, it was found impracticable to purchase exchange in the ordinary way, shipments of cotton were made to Europe on naval account to provide means for obtaining home freights. The appropriations applied in this way incurred the double risk of the homeward and outward voyages, and the ventures were not always fortunate.

In addition to all these drawbacks to the work of construction, one of no little magnitude had to be encountered in the transportation of heavy naval material, such as ordnance, propeller shafts, and machinery, from the point of manufacture to the building depots, over dilapidated railways already overburdened by the conveyance of troops with provisions and munitions of war and by the general—or it might be called the universal—travel, for the whole population seemed to be in motion.

As time advanced some of these evils were remedied, some wants keenly felt at first abundantly supplied, and new means and appliances brought into active play. Naval ordnance works and laboratories were established at Richmond, Charlotte, Atlanta, and Selma, which facilitated the work and largely increased the war products. A special bureau was appointed to foster the coal and nitre interests, with satisfactory results. Powder-works at Columbus, Ga., were made to yield all the powder the navy required. Rolling-mills at Richmond turned out iron plating whenever the raw material could be obtained, and at rope-walks set up at the same place the cotton fibre was successfully substituted for hemp, making a substantial cordage. But no human agency could find a substitute for iron, the great, the pressing want of the Confederacy during the whole struggle. Scarce at the beginning, towards the close it was not to be had at any price. In the early part of 1861 it was quoted at $25 per ton, in 1862 it had risen to $200, and in January, 1865, the price was $1300. The home product, never adequate to meet the ordinary local wants, much less the necessities of the government, had by this time been narrowed down to its minimum through the occupation of the mining areas by the enemy, and the supply from abroad had dwindled to driblets.

The work of constructing a navy, once commenced, was prosecuted with as much vigor as limited resources and trammeled facilities allowed. It began to take shape and system in July, 1861, though before that time the keels of some 15 gunboats had been laid at the York River and Pamunkey, and a few others at scattered points.

Our active naval force at that period could be easily reckoned. The "Sumter," of 530 tons and 10 guns, had run the blockade and was cruising in open sea. The "McRea," of 180 tons and 7 guns, with the "Jackson," converted from a river tug-boat, were in commission on the lower Mississippi. Two small steamers had been purchased from North Carolina for the defense of her sounds. Three side-wheel steamers, the "Patrick Henry," "Jamestown," and "Yorktown," had been brought from Virginia. The first of these was our most powerful vessel. She was of 1300 tons burden, armed with six 8-inch broadside guns and two 10-inch pieces on pivot, and had the most vulnerable parts of her engine shielded with iron. These vessels, with the "Lady Davis," the "Simpson," the "Resolute," and perhaps a few other light vessels not worthy to figure in naval annals, constituted the active naval force of the South at the period stated. The "Merrimac," afterwards the "Virginia," was on the stocks undergoing her conversion into an ironclad. The sloops "Germantown" and "Plymouth," sunk before the Gosport yard came into the possession of the South, had been raised and restored, but were never put in commission.

The *personnel* of the navy consisted of 9 captains, 26 commanders, 64 lieutenants, 4 masters,

75 midshipmen (full and acting), 19 surgeons and 10 assistants, 7 paymasters, 3 chief engineers and 10 assistants of all classes, 4 boatswains, 3 gunners, 4 carpenters, 3 sailmakers, and 500 enlisted men. All the officers of the superior grades and the greater part of those of the lower had resigned from the Federal navy.

In the summer and autumn of 1861 contracts were made for 11 steam-gunboats in all at the several points of New Orleans, Jacksonville, Richmond, Norfolk, Charleston, Chattahoochee River, and Pensacola Bay. In August two armored vessels were commenced under contract at Memphis, and in October the keels of two additional ones were laid at New Orleans.

Reserving for a somewhat more extended notice the "Virginia," which came first in the order of construction, let us here trace in a few words the history of these ironclads up to their final fate. One of the two last mentioned, the "Louisiana," Capt. Mitchell, not yet properly sheathed, altogether in an unfinished state, and totally unprepared for action, was forced by the emergency to take part in the defense of the approaches to New Orleans when that city was captured. At the earnest solicitation of Gen. Duncan, commanding Forts Jackson and St. Philip, she was hurried down to the approaching scene of conflict between the forts, where she arrived only three days before the hostile squadron made its memorable advance up the river on the 24th of April, 1862. She had left the levee, under tow of another vessel, with gangs of mechanics still working at her engine and her raw crew short in complement and eked out by an artillery company, who volunteered for the occasion, busy in mounting a battery at which they had never been exercised. Up to the hour of the fight she had not sufficient motive-power to stem the current of the river, and even to shift her berth from point to point required extraneous assistance. During the desperate contest that took place she was secured to the shore under Fort St. Philip in a position that precluded the use of half her guns. She was so powerful a vessel that had she been thoroughly completed and prepared for battle some interesting incidents would have been added to that night's encounter.

The "Louisiana" was 264 feet long, with a beam of 64 feet. Her hull, which was nearly submerged, was surmounted by a casemate protected by a covering of double T-rails as a substitute for iron plates that could not be obtained, and inclined at both sides and ends at an angle of 45°. A metallic deck formed the top of the casemate, and was the station of the small-arm men when at quarters. It was open overhead, but guarded against grape and canister by heavy bulwarks plated with iron. The battery consisted of 16 guns, made up of two 7-inch rifles, three 9-inch shell pieces, four 8-inch and seven 6-inch smoothbores. The propelling power was two central wheels inclosed in the body of the hull and a propeller on each quarter, which last assisted in steering. The armor passed through a severe test during the action, receiving a broadside at close quarters from the 8-inch rifled guns of the "Hartford." The shells buried themselves to about half their diameter, then fell crumbling into the river.

The surrender of the forts to the mortar flotilla three days after the action with the fleet completely isolated the ironclad. Hemmed in above and below by overpowering forces, without means of replenishing her supplies, and scarcely capable of stemming the current, notwithstanding the completion of her engines since the engagement, her capture even by simple blockade was a mere question of a few days. In this extremity a council of war was held, which decided upon her destruction. She was accordingly set on fire, and her officers and crew, who had taken refuge on board of tenders, where they were soon made prisoners, witnessed from the decks of the enemy the final catastrophe, when her magazine exploded and her fragments were given to the waters.

The new ironclad built at New Orleans was pronounced "wonderful" by a veteran commodore who had served in almost as many ships as he had years. And she was wonderful for her novel structure, her massive weight and strength, and her abundant promise of speed and power. The work upon her had been watched and urged with unusual solicitude by the Department from the moment the first plank was laid, and the most glowing hopes were entertained of successes that were to follow her completion. It was believed —and the belief was not thought extravagant at the time—that when armed and equipped she would almost unaided be capable of assuring naval supremacy in the Mississippi waters, and even of raising the blockade of the Gulf ports.

The structure of this vessel was peculiar and entirely new. Some years ago a Scotchman who had never been to sea wrote an original treatise on naval tactics which became the text-book of the royal navy, and in the instance of the "Mississippi," a planter in the interior of Georgia, Mr. Nelso Tift, who knew nothing of naval architecture, incited by the exigencies of the moment, conceived a new method for building naval ships, which his brother, Mr. Asa F. Tift, a merchant of Key West, assisted him in developing. His device was designed to obviate the difficulties arising from the great scarcity of shipbuilders, and the equal scarcity of the crooked timber which they employed. The hull of an ordinary vessel is made of a skeleton of futtocks, curved ribs, and crooked cross-knees, to which the planking, artificially bent to follow the lines of the model, is bolted outside and inside. The plan of the Tifts dispensed altogether with this complicate frame-work, and substituted for the sides of the vessel a solid wall of pine planks built with the requisite thickness upon a flat bottom, and having only straight lines and flat surfaces except at the junction of the sides with the ends. This plan made available for every purpose of the structure, from stem to stern, the tall straight timber of the Southern forests, and the simplicity of it placed the work within the capacity of ordinary house carpenters and joiners.

The Tift brothers submitted their plan to the Secretary of the Navy, and that official, upon its being approved by a board of experts, appointed the inventors agents of the Navy Department to carry the plan into execution by the construction of the "Mississippi" at New Orleans. That city, as the great commercial metropolis of the South, and at the gateway, as it were, of the Mississippi, was one of the most important strategic points indicated in the movements of the enemy, and as yet it was almost naked of naval defenses.

It were tedious to recount all the obstacles these men, who voluntarily served without compensation, had to conquer to achieve the work they had undertaken. A building depot had in the first instance to be created, which involved the sinking of piles in the alluvial banks of the river for the bed of the ship, and the erection of sheds, saw-mills, blacksmith-shops, and other adjuncts usually found ready and at hand. The bolt-iron required was collected piecemeal from every quarter,—New Orleans, Macon, Mobile, Chattanooga, and elsewhere. The building timber was still in leaf, and had to be transported, when felled and sawed, from various points in an area a hundred miles around. The Confederacy was scoured for iron-workers who were willing or able to roll the plates for the casemate, until a contract was made at last with an establishment at Atlanta, which had to change its rollers for the purpose, but the scarcity of iron had nearly balked this arrangement. The manufacture of the engines was perforce committed to establishments already overtaxed by private work and army contracts. Next to the machinery, the most important object was the shafting for the propellers. It was essential for the security of the vessel that this should be of wrought iron. It is a striking evidence of the nakedness of the land in regard to naval necessities that in the whole Confederacy there was not a foundry competent to make the shafting.

When at last the inventors seemed to be driven to the sorry expedient of substituting cast- for wrought-iron shafts, they were fortunate enough to induce a party in New Orleans who was putting up an air-furnace and forging a large steam-hammer for the purpose of making Armstrong guns for the government, to adapt these appliances also to making the shafting. The two side or quarter shafts were thus made at New Orleans, and the central one was manufactured at Richmond, from a wrought-iron shaft recovered from a burnt ship.

Superadded to all these difficulties were strikes of laborers for higher wages, delays in the delivery of timber from contractors, and financial troubles from want of proper arrangements at Richmond.

The first plank of the new vessel was laid on the 14th of October, and, with little exception, a force varying from 500 to 600 men, stimulated by liberal wages and jealously watched by the committee of safety of the city, were kept working on her from that day forward.

Anxiety to avoid interruption in the work induced the Tifts, with the concurrence of the naval authorities on the spot, to postpone launching the ship to the last moment. This solicitude proved fatal in the end.

The enemy's preparations for the descent on New Orleans began at Ship Island in the latter part of February. In March the fleet had mustered at the mouth of the river, with many of the heaviest ships over the bar. The ability of war-ships to run successfully past shore batteries had been too frequently exemplified to admit of question. Such was the opinion of military and naval men at New Orleans at the time. The inadequacy of our naval force to cope with the enemy was also apparent. The first and most effective obstructions stretched across the river had been swept away by the spring freshets, and gaps had been made by drift-wood in those that had been substituted. All these admonitory considerations, which it might have been supposed would have quickened the action of the Confederates into immediate efforts to save a vessel so formidable and so invaluable as the "Mississippi" by taking her in time to some secure retreat, failed to produce any serious impression. Yazoo River offered a temporary refuge at least, and Vicksburg was still in our possession with foundries and machine-shops available for continuing the work. But one dominant idea seems to have filled the mind of the Tifts, who, by special orders, had exclusive charge of the vessel until delivered over for service,—that of pushing forward the work; and this all-engrossing purpose closed their eyes to the palpable danger in which she stood from the menacing attitude of the enemy.

Though sufficiently advanced for launching long before, it was not until the bombardment of the forts by the mortar fleet had begun that she was put afloat. The first attempt to accomplish this was made on the 17th of April, and proved abortive. Three powerful steamboats attached to her broke their connecting hawsers in the fruitless effort to pull her off the ways. At last it was discovered that she had been bolted to her bed by some treacherous hand. This impediment being removed, she glided into the river on the following day almost of her own volition. It would not yet have been too late to save her. Between the 18th, when she was launched, and the 25th, when the enemy reached the city, ample time and means were at hand to send her up the river, but the golden opportunity was not improved. She was still allowed to lie at the wharf with the work upon her going on, perhaps with more intense earnestness and pressing dispatch, but as serenely as if Farragut's fleet were a thousand miles away instead of storming at the outer gates of the city.

At last, at early daylight on the 24th, the startling intelligence came that the great body of the fleet had passed the forts and was swiftly steaming up the river. The news fell like a clap of thunder and produced general consternation, followed by a relaxation of all police restraints, during which the dregs of the populace abandoned themselves to violence and plunder. It was in the midst of this riot and uproar that the hot and hurried attempt was at last made to save the "Mississippi." But it was now too late. Commander Sinclair, who had been assigned to the command, took her out of the hands of the builders. The day was passed in freighting her with building materials. At about 8 P.M. he started up the river under tow of two steamboats, but a freshet was prevailing at the time, and half the night was consumed in vain efforts to stem the rapid current. Midnight found the fated vessel again at her old moorings. Early the following morning, when every attempt had failed to obtain additional steam-power, and when the Federal squadron was in full view, the case had become hopeless, and the "Mississippi" was committed to the flames to save her from the hands of the enemy.

The "Mississippi" was 260 feet long, with an extreme breadth of 58 feet and a depth of hold of 15 feet. Her casemate sloped at an angle of about 36° to the horizon. The upper slopes

were covered with three plates of iron 1¼ inches thick, each disposed in two horizontal courses below, making joints covered by the upper or bolting course running vertically. The lower slopes had two courses of the same thickness crossing each other, the one beneath running lengthwise, and the sides of the ship between these slopes had a double layer of plates placed lengthwise. The level portion of her shield or upper deck was spread with iron plates 1¼ inches thick. She was pierced for 18 guns. Her intended battery was a mixture of 7½-inch and 10-inch rifles. Her engines were horizontal, with cylinders 36 inches in diameter, with 2½ feet stroke of piston. She was fitted with 10 double-flued boilers in two different sets, 30 feet long each, and 3 propellers, whose shafts, 9 inches in diameter, were, the central one 50 and the others 40 feet in length. She was calculated for a draft, when fully equipped, of 14 feet, and speed in smooth water of from 12 to 14 knots, and was adapted for sea as well as harbor and river service.

The "Arkansas" we have already referred to as the vessel that was conveyed from Memphis to the upper waters of the Yazoo for completion. Like the others, she had a sloping shield, which was covered by iron rail (double T), and her battery,—but in this we may be subject to correction,—we believe, consisted of 10 rifled guns of 8-inch calibre.

Commanded by Commander Brown, this vessel issued from her river fastness, protected by a barricade of rafts and a small battery, on the 15th of July, 1862, bound to Vicksburg. Near the mouth of the river she met, as had been anticipated, a reconnoitring expedition of the enemy, consisting of the "Carondelet," a Western ironclad, armed with 8- and 9-inch guns and one 100-pounder rifled, the wooden gunboat "Tyler," and the ram "Queen of the West," unarmed, but manned with a crew of sharpshooters. The engagement which followed was sharp and brief and very destructive to the enemy, whose shot and shell were wasted on the shield of their antagonist. The shattered and almost disabled vessels ran for shelter to the combined squadrons of Farragut and Davis, which lay directly on the road to Vicksburg, followed by the "Arkansas," which dashed through this formidable barrier without a moment's hesitation, receiving, unharmed and at point-blank range, the fire of their 9- and 10-inch guns, and delivering her own broadsides with fearful effect. Before the Federals had fairly recovered from the bewilderment of the sudden and unexpected onset she had dropped her anchor under the Vicksburg batteries unharmed in hull or crew. On the other hand, in these rapid encounters, which occupied but a few minutes each, the enemy, besides the damages sustained by their ships, suffered a loss in killed, wounded, and missing of 78 men.

A few hours after the battle the Federals, under the cover of a dark night, made a desperate attempt to destroy the "Arkansas" in spite of the batteries protecting her, but were successfully repulsed. The attack was renewed on the night of the 22d with the same result.

The career of this vessel was destined to be brief. While on her way, on the 5th of the following August, to co-operate with Gen. Breckenridge in an attack on Baton Rouge, she was disabled when she had reached the bend above that place by the breaking down of her port engine. It was patched up with such means as were at hand, but the engineer would not guarantee that it would last more than half a day. The next morning she started from her anchorage with the immediate purpose of attacking the "Essex," which was seen approaching up the river, when her starboard engine gave way. Being thus rendered helpless and unmanageable in full sight of the enemy, her destruction was the only means left to prevent her capture. She was accordingly run on shore and set on fire by the officer then in charge, Lieut.-Commander Stevens, the officers and crew making their escape.

The impression made upon the Federals by the exploits and formidable character of the "Arkansas" is pithily expressed in a letter of Admiral Farragut to the Secretary. "It is one of the happiest moments of my life," writes the admiral, "that I am enabled to inform the Department of the destruction of the ram 'Arkansas.'"

It is not our purpose to follow up the naval preparations in detail. They began mostly with the construction of wooden vessels, for the American mind had been so little occupied with ironclads that the most enlightened among the officers knew little on the subject. It was Maury who proposed the first vessels that were built, and he rejected the suggestion that they should be mailed with iron. The idea, however, gradually gained ground, and at length the success of the "Virginia" in the battle of Hampton Roads determined the policy of the government. Thereafter all the naval engineering skill and mechanical labor that could be commanded was devoted to the construction of armored vessels. They were built at every available point,—Charleston, Wilmington, Richmond, Savannah, and on inland waters of the Carolinas, Alabama, and Georgia. As the work progressed, marked improvements were made on the original models. The submerged ends and knuckles, the characteristic feature of the "Virginia," were dropped out of the future plans or considerably modified, but the sloping shield prevailed in all the structures. In three instances the batteries were placed in low citadels plated with 6-inch iron. The vessels were generally built by contract with private parties, the government agreeing to furnish the metal for armor, engines, and shafting; these were supplied by the naval works at Richmond, Charlotte, and Columbus, and the armaments, projectiles, and all objects of pyrotechny were prepared by the ordnance establishments at Selma, Charlotte, and Atlanta, or Augusta after the last place had fallen. We have already more than once adverted to the scarcity of iron. During the whole construction of these vessels the want became more and more urgent. Finally by the fall of 1864 the last supply of that metal had been consumed, leaving on the stocks 12 vessels completed but for their armor, which would have required 4230 tons that never was obtained. This brought the construction of that class of vessels to a final close. The number which had been completed and commissioned up to the 24th of November, 1864, was 25. Of these, 9, at that period, had been lost to the Confederacy,—viz., 2 by casualties, 4 burnt by their

own commanders to prevent capture, 2 captured, and 1 destroyed by the enemy.

The number of wooden vessels of all classes and descriptions within the waters of the Confederacy fluctuated so much from month to month that it would be hazardous to state it positively without more reliable data than we have on hand. Probably they never amounted to more than 50 at any one time. The Confederate navy had also a peculiar class of boats fitted for submarine and torpedo service, which, under the charge of officers who devoted themselves to that specialty, proved a valuable auxiliary, not only for its capacity to inflict sudden and unexpected damage, but for the dread and distrust it inspired. In July, 1863, the Federal steamer "De Kalb" was sunk by a torpedo in Yazoo River. In April, 1864, the "Squib," a small torpedo-boat, darted unobserved under the cover of night through the Federal fleet off Newport News and exploded one of these engines under the bilge of the "Minnesota," greatly damaging the vessel without destroying her. In May an expedition of the enemy ascending James River was retarded in its advance to the speed of a half-mile per hour by the necessity of scouring the banks of the stream and dragging its bottom to clear the path of these dangerous impediments, and was finally diverted from the intended descent on Richmond by an explosion under the bottom of one of the leading vessels, which was hurled into fragments. And it is an event to be remembered how, in August, 1864, the monitor "Tecumseh," in the midst of the fleet standing into Mobile Bay, vanished, as it were, from the face of the waters with every soul on board by coming in contact with one of the torpedoes strewn in the channel.

From what has preceded it may be seen that by the fall of 1864 the Confederate navy had reached its maximum. To recapitulate, it possessed then 16 ironclads, 3 of which were rated floating batteries, 50 wooden vessels (assumed), and 1 cruiser, the "Shenandoah," on the high seas. This final result of all the labors of preparation falls signally short of that foreshadowed by the letter of the Secretary of the Navy of May, 1862, but, considering the delays and difficulties and reverses that were encountered, and which we have but inadequately described, it is a proof of wonderful vigor and enterprise that so much could have been accomplished.

The general policy of the South throughout the war was to act on the defensive. So far as the navy was concerned, no other could have been pursued. Both the character of its vessels and their limited number rendered any systematic course of aggression impossible. The armored boats were adapted only for operating in smooth water, and the whole force was necessarily divided into detachments, occupying the most important points of defense, where each command was kept at bay by the superior strength of the enemy. The Confederacy was therefore compelled to submit to the humiliation of a continuous blockade without the power to raise it, its vessels for the most part lying idly at their anchors and passively awaiting events, with steam up and fires banked ready for the emergency when it should arrive.

This state of things afforded but little scope for enterprises of any magnitude, but frequent opportunities occurred or were made for striking a blow by means of special expeditions.

The first ironclad employed by the South was a vessel of some power called the "Manassas." She was originally a ferry-boat, and was transformed into a ram by a private company in New Orleans by the addition of a casemate faced with iron ¾ inch thick, and an iron prow 10 feet long. She swam low in the water, and carried a 60-pound Dahlgren gun. The owners lent this vessel to Commodore Hollins for an attack on the blockading force in October, 1861, then consisting of the sloops "Vincennes," "Preble," "Water-Witch," and "Richmond," all lying inside of the Southwest Pass.

With the addition to his flotilla of razeed river boats, 5 in number, and carrying 11 guns varying from 24-pounders to 8 inch columbiads, Hollins, having secretly made his preparations, carried the enterprise into effect on a night so profoundly dark that objects were not visible 20 yards ahead. Issuing from between the Forts Jackson and St. Philip, the little squadron, with the "Manassas," Lieut.-Commander Wharley, in the lead, dropped down the river so quietly that the surprise was complete. The crash of the ram as she buried her prow into the first vessel that could be discerned, which proved to be the "Richmond," followed by an appalling cry that rang out from the apparently sinking vessel, awakened the whole fleet to its first sense of danger. Fortunately for the "Richmond," her assailant suffered from the shock almost as much damage as she inflicted. Her prow was badly twisted, and one of her engines disabled. In this crippled condition the ironclad found herself carried by the current all alone into the midst of the squadron, and, exposed as far as the darkness permitted to its concentrated fire, she would have fared badly, but, throwing up a rocket, the concerted signal, the fire-barges came sweeping down in full flame upon the Federals, followed by the flotilla, and caused a general stampede. The "Richmond," though with a great hole in her bow, contrived to keep afloat, and daylight disclosed the dispersed blockaders far down within the Southwest Pass, with two of their vessels stranded on the middle ground. The Confederates stood down the Pass within range, and the little drama was closed by a distant cannonade, in which neither party suffered further damage. The "Manassas" had so well acquitted herself on this occasion that she became the property of the government by purchase.

The first great naval triumph of the South was the victory achieved by the ironclad "Virginia," in the memorable battle of Hampton Roads, on the 8th of March, 1861,—an event interesting not only for the immediate issues involved, but as introducing a new element in naval warfare, and inaugurating a revolution in the means and methods of future encounters.

The "Virginia" was the first naval structure of any magnitude invulnerable to shot and shell that was ever launched upon American waters, if we except "Stevens's floating battery," designed for the protection of New York, the keel of which was laid in 1845. She was originally the "Merrimac" of the Northern service, and had shared in the general conflagration of the men-of-war at the Gosport Navy-Yard, when

the effort was made to destroy that depot by a party under the command of Commander Paulding in April, 1861. She had been scuttled as well as set on fire on that occasion, but on raising and docking her it was found that the destruction had not extended below the water-line, and that the vital portions of her engine had escaped intact.

The design for converting the wreck of the old steam-frigate into an ironclad ram was furnished by Commodore Brooke, the naval chief of ordnance, who also devised the powerful guns of her battery. She was about 300 feet long, with about 55 feet beam. The chief characteristics of the new form she was made to assume as an ironclad were an armored casemate, sloping at an angle of 45°, and the submergence 2 feet below the surface of the water of her entire hull proper. The casemate was constituted by a wooden backing 7 inches thick, covered with two layers of wrought-iron plates, each 2½ inches thick, disposed horizontally and vertically one above the other. She had in addition a cast-iron stem or prow projecting 4 feet, and somewhat in the shape of a hog's head. Her general appearance suggested the roof of a house, or perhaps a rope-walk, floating on the water with its eaves immersed. Her armament consisted of two 7-inch Brooke rifles, one forward and the other aft, with a broadside of two 32-pounder Brooke rifles, and six Dahlgren 9-inch shell-guns. When she was fitted out, as the pressure for the supply of projectiles was very great on the ordnance department, and it was not expected that she would have any but wooden vessels to encounter, she was not supplied with solid shot or bolts.

The peculiar structure of the "Virginia" involved new and untried conditions affecting her speed, steerage, and general manœuvring which there was no opportunity of testing. The ship was begun the latter part of June, 1861, completed the latter part of February, 1862, and hurried into action the moment she was equipped. In point of fact, her experimental trip was made when she plunged into battle.

The Federals had been watching with no little concern the work as it progressed on the "Virginia," while hurrying at the same time to completion the "Monitor," of which we shall directly have occasion to speak. Meanwhile, a powerful fleet had been mustered in the waters near Fortress Monroe and Newport News, one of whose principal objects was to intercept and destroy the "Virginia" as soon as she should make her appearance,—a task which with such a force might, before the unhappy experience of the 8th of March, have been reasonably deemed easy to accomplish. The Federal squadron consisted of the steam-frigates "Minnesota" and "Roanoke," of 50 guns each, the sailing-frigates "Congress" and "St. Lawrence," of 50 and of 12 guns respectively, and the sloop-of-war "Cumberland," of 24 guns. The guns were all of 8- or 9-inch calibre, and made in the aggregate 186 broadside pieces, in addition to which were several 10-inch guns on pivot. This force of the enemy was further swelled by six or seven steam-gunboats heavily armed.

Everything seemed propitious when the "Virginia," bearing the broad-pennant of Commodore Buchanan and accompanied by two small steamers, the "Beaufort" and "Raleigh," of 1 gun each, at 11 A.M. started from the Gosport Navy-Yard to encounter the enemy. The sky was bright, the water smooth, the hostile vessels within easy reach, and the officers and crew cheerful and confident. And yet at the moment the success of the enterprise could by no means have been held as certain. The ironclad had yet to prove her invulnerability, and the ordeal in prospect was a formidable one. The Federal squadron was divided into two bodies; the "Minnesota," "Roanoke," and "St. Lawrence" lay near Fortress Monroe, and the "Congress," with the "Cumberland," was anchored off Newport News, so that, whichever field of battle was chosen, it was not only the guns afloat that were to be met, but those on shore.

A part of the Confederate fleet, the "Patrick Henry," of 12 guns, the "Jamestown," of 2, and the "Teazer," of 1, at this time were waiting, a little inside of the mouth of the James River, the first shot from the "Virginia" as the signal to run the gauntlet of the batteries at Newport News and take their share in the fight. The accession of these vessels would swell the number of Confederate guns to 27.

Buchanan reached Sewell's Point at 1 P.M., and found the enemy, who had caught sight of his smoke, on the alert in both directions. Doubling round Craney Island flats and taking the lead he selected the "Cumberland" as the first object of attack, between which vessel and the Confederates there lay a clear reach of about 3 miles of unobstructed water. He bore directly down on that ship, and, notwithstanding the "Congress" lay close to his path, held unflinchingly to his course till he struck her. As he came within easy range of the "Congress" he opened the battle with his bow-guns charged with grape, which flew over her or lodged in her sides without much damage. This drew from her a full broadside when the two ships were about 1200 yards apart. Her shell burst against the armor and fell in fragments, and her solid shot glanced or rebounded and tumbled into the water; both were as harmless as would have been a shower of paper bullets. The return broadside of the "Virginia" was terribly destructive, crashing through the wooden sides and slaughtering a large number of the crew.

Still holding steadily to her course, she pushed onward and past the "Congress," and, receiving the same ineffectual fire from the "Cumberland," poured into her as she approached the contents of her bow-gun, which raked her fore-and-aft and literally mowed down the men in heaps as they stood at their quarters. The next moment, in the midst of this frightful carnage, the ironclad, with the impetus of a full head of steam, plunged headlong into the bows of her antagonist with instantaneous and decisive effect. The crash of the rending planks and timbers was distinctly heard in the midst of the roar of guns and the reverberations of the armored casemate on which the missiles were playing as upon an iron drum. The "Cumberland" was a helpless wreck from that instant. As the "Virginia" withdrew from the contact she left a great breach behind, into which the water gushed in torrents, and the hapless ship began at once to settle. In a short time she heeled over and sank, grounding at a depth of 50 feet with nothing visible left but the tops of her mast and her flag still flying. The contest, though so unequal, had

been as desperate as it was brief. The firing from both ships had never ceased from the beginning to the end of the encounter, and—be it said in all honor to the heroic defenders of the Stars and Stripes—the last shot from the sinking ship came from guns that were about dipping their muzzles in the water. So rapid had been the destruction of the "Cumberland" no time was afforded to save the wounded, and those incapable of helping themselves were carried to the bottom. The rest of the crew jumped overboard as the ship went down, and many were drowned before being reached by the boats which were sent from Newport News to their rescue. Out of a complement of 376 men, officers and crew all told, 117 were lost and 23 missing.

While the "Virginia" was thus proving her resistless power on the "Cumberland," the "Beaufort" and "Raleigh" were each playing their single rifled piece upon the "Congress" with quick and sharp results, the odds against them being largely compensated by their ability through steam-power to choose distance and position as well as by the larger and fixed target the enemy presented.

As the "Cumberland" disappeared from the scene the Confederate vessels hove in sight in rapid approach from James River. They dashed through a storm of shot and shell, grape and canister, poured into them from the batteries of Newport News, in which the "Patrick Henry" in the loss of a few men was the only sufferer, and joined the two small steamers in the attack on the "Congress." Meanwhile, to escape the fate of her consort that vessel, with the help of her topsails and a tug-boat, had contrived to put herself in shoal water, where she grounded.

While all this was going on Buchanan was manœuvring for the best position to turn his guns on the "Congress." This was a matter of no little difficulty in the contracted space of the theatre of the combat with a vessel of the length and draft of the "Virginia," so that he was compelled to run past the batteries of Newport News for a more roomy area in the mouth of the James, in order to put her head in the proper direction. The "Congress," mistaking the movement for a withdrawal from action, gave three cheers. The shore batteries opened a furious fire during the ironclad's passage to and fro in close proximity. The pounding she endured did not start a single rivet or bolt of her armor. Her return fire silenced some of the batteries, blew up a steamer at the wharf, and sank a schooner.

The fate of the "Congress" was now swiftly determined. The "Virginia" took a raking position under her stern at a distance of about 200 yards, and delivered her shot and shell with all the deliberation and precision that might have attended a holiday practice. The "Congress" had thus the concentrated fire of the whole squadron upon her, which she endured to the last moment. It was not until her whole broadside batteries were disabled and her crew were rapidly falling in every discharge from the enemy that two white flags were displayed, one at the gaff and the other half-masted at the main.

This gave a momentary pause to the havoc. The "Beaufort" and "Raleigh" were dispatched with orders to take possession, make prisoners of the officers, allow the crew to land, and burn the frigate. While in the execution of this mission, and while the white flags were still flying upon the conquered ship, a fire was opened upon those vessels from the shore batteries. This took place after the formal surrender of themselves and of their vessel had been made on board of the "Beaufort" by the commanding officer and executive, who, at their own request, had been temporarily released to assist in having the wounded transferred to the two steamers. Those vessels were thus compelled to leave, and made their way to Norfolk with such of the wounded as they had received.

Buchanan now sent a boat in charge of Lieut. Minor, convoyed by the "Teazer," with orders to set fire to the "Congress," but was baffled in this fresh effort by a renewal of volleys from the enemy upon the party, under which some lives were lost and Minor was wounded. Finally, under these repeated provocations, he determined to effect his object by incendiary shot. This was soon accomplished, and the "Congress," which had been abandoned by her officers and crew, who saved the wounded in their retreat, was speedily wrapped in flames and reduced to fragments as soon as they reached the magazine.

Leaving the burning vessel to her fate, the "Virginia," with the "Patrick Henry" and "Jamestown" in company, next proceeded to attack the "Minnesota." That vessel, manœuvring in shoal water to avoid the direct onset of the ironclad, had run aground, and was now a firm and fast fixture about 2 miles from Newport News on the north side of the North Channel. With the "Roanoke" and "St. Lawrence" she had come late into action, in which they engaged at long range.

The attack on the "Minnesota" occupied the three closing hours of that eventful day. The "Virginia" opened her fire, but without serious effect, at a distance of about 1 mile from the enemy, the nearest point she could reach. The rifled guns of the "Patrick Henry" and "Jamestown" were now telling and did considerable damage. The only gun the "Minnesota" could bring to bear was her 11-inch gun on pivot.

Night at last put an end to the contest. The Confederates, satisfied that the shoal would hold fast the frigate till next day, doubled the west end of the middle ground and made their way for anchorage under Sewell's Point, merely pausing to give her a parting broadside as they came abreast of her in their passage thither.

About 9 o'clock in the evening of that exciting day the worsted Federal squadron, or what was left of it, was cheered by a new and important accession to its force in the arrival of the "Monitor." The fame of that iron vessel had preceded her, and her arrival at so opportune a moment was as welcome as it was unexpected. She was built after a design and plan devised by the distinguished mechanician Ericsson, and had no antetype in any known naval structure. She was smaller, lighter, and from her inferior draft and greater mobility was infinitely more manageable, than the bulky competitor against which she was about to be pitted. She swam the water at a depth that brought her metallic spar-deck flush with the water, and offered no mark to the shot of the enemy but a revolving central citadel 10 feet high and 20 in diameter, surmounted by a pilot-house in the form of a low turret, and concentrating within its imper-

vious iron walls her whole battery, which consisted of two 11-inch rifled guns.

The contest under this change of conditions was renewed early in the forenoon of the 9th, the "Virginia" now commanded by Lieut.-Commander Jones, who had succeeded Buchanan, disabled by a severe wound the previous day. The "Virginia" was again supported by the "Patrick Henry" and "Jamestown."

The combat was of a novel and striking character. It resolved itself largely into a duel between the ironclad and the "Monitor," the one cumbrous and heavy, dragging at times in the mud owing to her great draft, and requiring a free scope for effective evolutions, but fighting in a very restricted space; the other of light draft, agile, and buoyant, and turning round in an area whose diameter might almost be measured by her own length, while each vessel was impenetrable to the missiles of the other.

The efforts of the "Virginia" were mainly directed to two objects, viz., to sink her antagonist by running her down and to improve every opportunity to hurl her shot into the "Minnesota," still lying helplessly aground. The "Monitor," on the other hand, while not declining an engagement at close quarters, aimed at manœuvring so as to elude an onset that might be fatal, and, while endeavoring to crush the armor of the "Virginia" with her heavy 11-inch guns, at the same time sought to maintain a position that would most effectually cover the stranded frigate.

Twice the "Virginia" succeeded in running into her, but not with the required impetus or a stroke sufficiently direct to effect her purpose. The buoyancy of the struck vessel saved her: she glided from beneath the blow and swam as upright as ever.

During the action the "Minnesota" was very much cut up in spite of the interposition of the "Monitor." One shot especially from the bow-gun of the ironclad produced great havoc, battering down her bulkheads and in its passage along her decks exploding cartridges, which set her on fire. The next shot blew up a steamer alongside of her. The rifle-guns of the two steamers did also their part in crippling her.

On this occasion the "Minnesota" was able to employ her broadside guns, which in one instance, were leveled against her adversary at point-blank range, but they might as well have been discharged in the air. In the midst of the battle the ironclad ran on shore. With her massive dead weight the position was a critical one, but luckily she was backed off before any advantage could be taken of the accident.

The struggle between the combatants was maintained with desperate earnestness on both sides without other results than those noted, when the Confederate commander thought it useless to protract it. He was unprovided with solid shot or bolts which might have proved effective against the citadel of the "Monitor," on which his shell could make no impression, and that vessel had retired to shoal water beyond the reach of attack by ramming. The "Minnesota" was also inaccessible to close approach, and believed to be entirely disabled. There was, therefore, nothing left to accomplish, and about noon the Confederate squadron left for Norfolk to repair such slight damages as they had sustained during the two actions.

Indeed, the damage, considering the pounding to which the "Virginia" had been exposed, was so inconsiderable that the hopes of the most sanguine as to her powers of endurance were more than realized. A shallow indentation on two of her plates was the only mark left upon her armor; her steam-pipe and smoke-stack were riddled, two of her guns were shorn of their muzzles, her anchors were lost, her stem twisted, and her prow was left in the breach it had gored in the bows of the "Cumberland." Thus in a short time every repair was completed, and supplied with solid shot and bolts, she made the tour of Hampton Roads in the hopes of testing them on the "Monitor," but no engagement followed.

The question of the value of ironclads for harbor defense as compared with wooden vessels was determined in Hampton Roads at once and forever. In the two actions the entire loss of the "Virginia" was 2 killed and 17 wounded. The disastrous result to the Federals may be summed up as the complete disablement of one frigate and the destruction of another, with a first-class sloop, and the aggregate loss on board of the two latter vessels of 255 killed and 23 missing. The loss on board of the disabled vessel, which must have been considerable, we have no means of ascertaining.

We have been led to dwell at some length upon the actions in Hampton Roads by the novel and remarkable expedients that were first employed in these contests. The "Virginia" came out of the conflict a historical ship. In all future narratives of naval war she will loom up conspicuously as having determined a new line of development in naval forces leading to a complete revolution in the naval systems of the whole world, as well as those of coast and harbor defenses. The triumph of that vessel was a brilliant one, but short-lived. The story of her final fate is soon told.

When the exigencies of the war compelled the evacuation of Norfolk, the "Virginia," now under command of Commodore Tattnall, was left in a critical position. She had no means of sustenance except a limited supply, and no means of renewing that supply when exhausted. She was lying near Craney Island, and merely mistress of the waters within reach of her guns for a few uncertain days.

In this dilemma Commodore Tattnall, on whom the government seemed to have silently cast the responsibility of disposing of the ship, determined if possible to reach Richmond. One obstruction only lay in his way, but that was formidable. A shoal, on which at the top of the flood there were 8 feet less water than his vessel drew, stretched across the river a little above City Point. The pilots promised to tide him over safely if he could reduce the draft, which was at the time 22½, to 18 feet. In the emergency nothing was left but to make the attempt. Every object of weight except what was actually necessary for defense was cast overboard to lighten the ship; shot and shell, chains, anchors, water, coal, provisions, all followed one another into the river. But all was of no avail. The ironclad rose out of the water until her draft was lessened to 19½ feet, and there she stood with all the movable heavy material out of her and a broad streak of unsheathed bottom resting above her water-line. The alternative then presented itself of a certain capture by the enemy,

even by blockade, within a time that might be calculated, or her destruction. A council of war decided that she should be burnt, and the career of the "Virginia" was thus closed on the morning of May 11, 1862.

If, after the fight of the "Virginia," the value of ironclads for harbor defense required any confirmation, it was amply supplied by the extraordinary display of endurance exhibited by the "Tennessee" in her engagement with the Federal squadron in 1864.

That vessel was in round numbers 209 feet long by an extreme breadth of beam of 48 feet, and drew on the average 14 feet water. She was built of a combination of yellow pine and oak. The sides of her hull proper were about 8 feet thick from knuckle to keel, and protected by sponsors coated with a double layer of 2-inch wrought-iron plates. These defenses dipped 5 feet below the water-surface, and terminated forward in a stout iron-sheathed beak projecting from the bow at 2 feet under water.

The casemate was 79 feet long by 28 feet wide in the clear, leaving unoccupied a considerable margin of waist-deck on either side of its base and the entire quarter-deck, both of which were sheathed with 2-inch wrought-iron plates. The framing was a marvel of strength and solidity. It consisted of heavy yellow pine beams closely joined together in a vertical position, with 5½-inch planking of the same material laid on horizontally outside, on which again was a layer of 4-inch oak timber bolted on vertically; added to all was an inside lining of 2½-inch oak planking applied diagonally, the whole constituting a backing to the wrought-iron armor, 25 inches thick. The armor was secured by bolts passing through the entire mass. It was 6 inches thick on the forward slope, and consisted of two courses of plates of equal thickness; on the side slopes and at the rear three courses of plates were laid, two of which were 2 inches thick covered by one of 1 inch thickness.

The casemate had a flat top consisting of heavy wrought-iron grating, in which hatchways were contrived by swinging portions of it on hinges so as to open outwardly. The port-holes, 10 in number, two on either broadside, three aft, and three forward, were horizontal apertures long enough to give free scope for training the guns, but affording little space for elevation or depression.

The battery of the "Tennessee" consisted of 6 rifle Brooke guns, two of which were 7½-inch bore, mounted one forward and one aft, and four 6-inch bore, carried two on each side. The projectiles were 95 pounds in weight and the solid shot 110 pounds.

The pressing urgency for the services of this vessel caused her to be equipped with the utmost dispatch, which may account for a remarkable oversight in the arrangement of her steering-gear, which, as we shall see in the sequel, was the proximate cause of her capture. No leisure was left for trial-trips and such corrections and improvements as those tests would have suggested. Her crew were generally raw and inexperienced. Seamen were so scarce in the Confederacy that they formed but a small fraction of her ship's company. These observations apply equally to the 3 third-class wooden steamers forming, with the "Tennessee," the squadron under the command of Admiral Buchanan at Mobile, viz., the "Morgan," Capt. Harrison; "Gaines," Capt. Bennett; and "Selma," Lieut. Commanding Murphy. The "Morgan" and "Gaines" mounted each six 6-inch rifle-guns, and the "Selma" four guns of the same description. The aggregate force of the squadron was 470 men and 22 guns.

On the morning of the 5th of August, 1864, this small fleet was waiting under the guns of Fort Morgan, in Mobile Bay, the encounter with the Federal squadron of 18 ships, including 4 monitors, manned by 2700 men, and mounting in all 199 guns, which ranged from 9 to 15 inches in calibre, and threw projectiles varying in weight from 84 to 428 pounds.

The bare statement of the immense disparity between the antagonistic forces foreshadows the inevitable result of the conflict we are about briefly to sketch.

The Federal squadron was commanded by Admiral Farragut. It consisted of the 4 monitors already referred to, the "Tecumseh," "Manhattan," "Winnebago," and "Chickasaw," the two first armed each with two 15-inch guns, and the others each with four 11-inch guns, and 14 steamers, viz., the flag-ship "Hartford," 28 guns, "Brooklyn," 26, "Octora," 10, "Metacomet," 10, "Richmond," 24, "Port Royal," 8, "Lackawanna," 14, "Seminole," 9, "Monongahela," 12, "Kennebec," 5, "Ossipee," 13, "Oneida," 10, "Galena," 14, and "Itasca," 4 guns.

The preparations of the enemy for battle, from all accounts, embraced every expedient that the most wary foresight could suggest for putting each vessel in the best possible defensive condition. Besides the customary precautions in such cases, the steering-wheels were barricaded with sails and hammocks, the hurricane-decks spread with sand-bags to protect the machinery underneath, while chain-cables, snaked in close fakes up and down the sides, converted each wooden vessel for the time being into quasi-ironclads.

The squadron passed over the bar at the mouth of Mobile Bay at early daylight of the day stated, and steamed midway up the main ship-channel, which ran, at the nearest point, within about a half-mile of Fort Morgan. It was ranged in an order of battle of one compact line, headed by the monitors, with the "Tecumseh" in the lead, followed by the wooden vessels, lashed two abreast, with the side-wheel steamers on the off-shore or port side of their consorts. The "Brooklyn" was the advance ship at starting of the wooden vessels, the "Hartford" following in her immediate wake.

As the force drew near Fort Morgan the "Tecumseh" opened the drama by a single shot, which was returned by a volley as the wooden ships came in closer range. The battle then began in earnest, with a furious cannonade on both sides, each ship plying her bow-guns until sufficiently advanced to make her broadside available, and the fort, in its turn, maintaining a steady and destructive fire through the hail of shot and shell that was making considerable havoc among the gunners at the embrasures.

The flag-ship and the "Brooklyn" were the severest sufferers under the fire, both losing a number of men. A startling event occurred soon after the engagement, which might have dis-

turbed the equanimity of a less resolute man than the chief of the squadron. The "Tecumseh," at the moment some 300 yards in the lead, ran upon a torpedo, and disappeared almost with the suddenness of an apparition, carrying down nearly the whole ship's company of 123 men, including the commander.

Almost upon the heels of this thrilling incident, the "Brooklyn," in order to avoid a supposed nest of torpedoes, as indicated by buoys, nearly under her bow, reversed her engine, and commenced backing, at the risk of throwing the whole column into confusion at a critical juncture. The danger was averted by the "Hartford" promptly dashing to the head of the line and running safely over the suspected spot. By these manœuvres the flag-ship and the "Brooklyn" interchanged positions.

As the enemy was about emerging from under the fire of the fort, he met the Confederate fleet drawn up in mid-channel behind a line of torpedoes, which, probably from having been too long submerged, proved of no service in checking him.

The "Tennessee," supported by 3 gunboats, began the battle by opening upon the flag-ship at about 6.30 A.M., and followed up the attack by bearing down upon her antagonist at full head of steam, in the hopes of sinking her. The alertness and superior speed of the "Hartford" saved her. She steamed ahead untouched. Baffled in this purpose, the ironclad swept round in a wide circle to gain a proper heading and impetus to repeat the attempt upon the "Brooklyn," the next ship in the line. The second attempt was equally fruitless and owing to the same cause,—the superior fleetness of her intended victim. Meanwhile, the guns were vigorously plied on both sides, while the Federals still advanced in unbroken column up the bay in the direction of a pocket of deep water known as the "Lower Fleet."

The Confederate gunboats, comparatively frail structures at best, and bare of all supplemental defenses, gave no very cheering promise of being able to render effective support to their chief against such heavy odds; but they were handled skillfully and served their rifle-pieces with spirit and effect. One shot alone from one of them, according to the official report of the enemy, killed 10 men and wounded 5 at number one gun on board the "Hartford."

The "Gaines" was the first one of the three put *hors de combat.* She kept up an active attack for some time upon the whole line while steering in courses nearly parallel with the advancing fleet at distances gradually diminishing, which at last brought her within short range of some of the heaviest vessels. Finally a shot under her counter, combined with the concussion of a shell that exploded under her bilge, closed her career, and her commander had barely time to put his sinking vessel about and reach the beach near Fort Morgan, where she was stripped of all valuables and abandoned.

The "Morgan" used her guns to great advantage by keeping well on the bows of the "Hartford" and delivering raking fires, and had a slight brush with the "Metacomet." She sustained no serious damage in the conflict, and was preserved to the Confederacy by running the gauntlet of the enemy's squadron under the cover of night and reaching Mobile in safety.

The "Selma," after the loss of two of her best gunners, and with two of her four guns already disabled, was attacked by the "Metacomet," carrying eight 9-inch Dahlgrens, and two 100-pounder Parrott guns, and after a brief but spirited contest, attended with the additional loss of 6 killed and 7 wounded, succumbed to the superior force of her enemy.

After the capture and dispersion of the gunboats the battle assumed a new phase, and was one of the fiercest ever recorded in naval annals. At this juncture the "Tennessee," by reason of her evolutions and sluggish movements, found herself far astern in the neighborhood of Fort Morgan. From this point Admiral Buchanan started on the desperate venture of engaging single-handed the entire Federal squadron. The act was a splendid specimen of naval intrepidity, but it almost provokes the terse criticism of Count Von Moltke upon the famous charge at Balaklava, "C'était beau, mais ce n'était pas la guerre."

The approach of the "Tennessee" awakened anew the enemy, who had in the mean time anchored in the "Lower Fleet," into animated movement. Every anchor was at once lifted, and every preparation made to give the ram a warm reception. At length the "Tennessee" steamed into their midst, dealing fearful destruction with her shot and shell as fast as her battery could be served, yet mainly intent on sending her opponents to the bottom by direct onset. But all her efforts to sink the enemy by ramming proved unavailing. She was directed against ship after ship as soon as in each instance she could be swung round to the proper heading, but in each case the object of her attack was enabled by superior speed to dart away from her path unharmed. While this was going on every gun of the 197 that could be brought to bear upon her shield was in full play whenever the opportunity occurred. It hardly seemed possible that any structure of wood and iron wrought by the hands of man could withstand the successive volleys at close quarters, varying in distance from 3 to 30 yards, of the heaviest ordnance then ever known to be put afloat. Yet with a single exception her casemate resisted every missile. This exception was one out of four shots that struck from the 15-inch guns of the "Manhattan." The ball weighed 428 pounds, and was delivered at close quarters. Even this did not pass entirely through the casemate, but it penetrated the 6-inch armor and buried itself in the wooden backing.

Finding his guns so ineffective, the enemy now adopted the tactics of his assailant, and three successive attempts were made at running her down. The "Monongahela," one of the heaviest ships, rushed upon her with all the impetus she could derive from 30 pounds pressure of steam, and struck her fair, but with no other effect than carrying away her own prow and cutwater. Swinging round she delivered, in parting, the contents of her 11-inch guns without producing any apparent impression. The "Lackawanna," a vessel of the same class, made the next trial, striking the ironclad at full speed and at right angles, but the only fruits of the collision were the injury to herself of crushed bows and heavy leakage. The "Hartford" now tested her power in the same effort. Her blow was a glancing one,

and equally abortive. As she sheered off she poured her whole broadside against the casemate at the distance of 10 feet without sensible effect, and, in return, received a shell from the ironclad which exploded on her berth-deck, causing great havoc.

But though, with the exception noted, the shield up to this time had remained intact, the "Tennessee" had by no means escaped without injury. The concussions resulting from the incessant play of missiles upon her casemate, and the still heavier assaults by collision, had shaken her stout timbering and produced a serious leak, the after port cover had been disabled by a shot which killed one man and broke the leg of the admiral, the sliding covers of the two quarter ports had been so jammed by the fire of the enemy as to become fixtures, and the smoke-stack, long before riddled by shot, had been at last swept away flush with the deck, in consequence of which the steam was fast going down for want of draft.

The next disaster was utterly irremediable. The shot that caused it may be said to have decided the battle; it cut away the steering-chains. By some strange fatality these vital appliances had been left entirely exposed. They led along the entire length of the quarter-deck outside of the shield without cover or protection of any kind, though the severance of a single link was the loss of the ship. The relieving tackles, to which recourse was had, were equally bare of protection, and a succeeding shot unshipped them from the rudder-head.

This sounded the calamity, and made it the beginning of the end of the struggle. To reach those broken organs of a ship's guidance would have been to pass over a deck above which a swallow could not have flown without being brought down, so completely was it swept by the great guns and Minié rifles of the enemy. Hence no thought of repair was entertained.

With her steering apparatus demolished and her steam fast wasting away, the ironclad was incapable of executing the slightest manœuvre, incapable, in fact, of changing her position. The enemy was not slow to avail himself of the advantage. The monitors and the most powerful of the wooden vessels took position astern and on each quarter and poured their broadsides into her without longer intermission than was necessary to reload their guns. The "Tennessee" endured this concentrated fire of the heaviest guns nearly thirty minutes, and endured it in silence, for she was unable to bring a solitary gun to bear upon her assailants. At last Commander Johnson, the executive-officer upon whom the command had devolved, discovering that another attempt was about being made by one of the largest ships to sink the vessel by running her down, and satisfied that all further resistance was useless, with the concurrence of his wounded chief mounted to the top of the casemate, and, amidst the whizzing of countless balls that fortunately spared his person, hauled down with his own hands the Confederate flag.

The victory was dearly purchased by the Federals, as a comparison of the killed and wounded on both sides will show.

The casualties on the Confederate side were as follows: on board of the "Tennessee," 1 killed, 1 mortally wounded, 9 wounded; "Gaines," 2 killed and 3 wounded; "Selma," 8 killed and 7 wounded.

The loss of the enemy in killed and wounded was 300 men, exclusive of 100 carried down in the "Tecumseh." Adding the last figure, the entire number in killed and wounded amounts to within 78 of the aggregate complement of officers and crew of the whole Confederate squadron.

The commerce of the United States, which in 1861 whitened every sea, was the more exposed to attack by the withdrawal of her ships of war from foreign stations to co-operate in the investment of the Southern coast. The South improved the advantage by fitting out sea-cruisers, both at home and abroad, for the special purpose of preying upon it.

We have only space for a rapid and summary notice of the operations of the more noted of those vessels.

The "Sumter," a small propeller of 500 tons burden, was the pioneer. She was originally a Havana packet. Altered and strengthened, mounted with an 8-inch shell-gun on pivot amidships and two 24-pounder howitzers on either broadside, and manned by a crew of 105 men, all told, she turned out a swift, staunch, weatherly craft, in every respect adapted to her object. Commander Raphael Semmes was appointed to the command.

On the night of the 30th of June, 1861, this vessel put to sea from the mouth of the Mississippi, dashing through the blockading force, consisting of the "Brooklyn," "Iroquois," and "Minnesota." Outstripping the "Brooklyn," which gave chase, she found herself in a few hours free to start on her roving mission.

A week after her departure she entered Cienfuegos with a fleet of 7 prizes in her wake, having destroyed one during her passage.

Application was made to the local governor for the privilege of leaving the prizes in charge of an agent for future adjudication in the courts of the Confederacy. A similar request was subsequently made in the case of another prize at Puerto Caballo. In both instances it was refused. The European powers had, in fact, forbidden the introduction of prizes into their ports by either party, and the states on the American continent followed the example.

With the gates of the world thus churlishly closed against her captures, and her own harbors rendered inaccessible by the blockading forces, the "Sumter" was compelled to adopt the policy, which afterwards became general, of burning as fast as she captured, except where the prize was protected against destruction by a neutral cargo, in which case it was released under bonds made payable upon the declaration of peace between the United States and the Confederacy.

The "Sumter" reaped her first and most abundant harvest in the Caribbean Sea, where she remained cruising some weeks in the most frequented tracts of trade. She then coasted the shores of Venezuela and Guiana, and finally reached her most southern point at Maranham, Brazil. The necessity to renew her supplies obliged her to touch at the principal ports that lay in her way, and, as a general rule, she met with scant courtesy from the authorities. The world-wide influence of a powerful nation was

against her wherever she turned, and the hospitalities she required, when not positively refused, were bestowed in a carping and grudging spirit.

From Maranham she proceeded to a new cruising-ground, some 4 or 5 degrees north of the equator, in the path of vessels homeward bound from Cape St. Roque. Here several weeks passed without bringing a single capture, and with her coal nearly exhausted she bore up again for the West Indies.

Rumors were constantly reaching the little craft during her whole cruise of numberless vessels dispatched in hot pursuit of her. The realization of these tales seemed at length to have arrived. About the middle of November, while busy coaling at St. Pierre, Martinique, the "Iroquois" made her appearance. She stood slowly in and swept round her designed prey, narrowly inspecting her, the men of both vessels meanwhile being assembled at quarters. This was the nearest approach to actual hostilities. The superior force of the Federal vessel put entirely out of question any thought of a voluntary contest on the part of the "Sumter." Her enemy was double her size, carried nearly twice her number of men, and was armed with nine 11-inch guns. The "Iroquois" stood off and on the port several days, keeping up a close blockade, but the object of her watchfulness, patiently waiting her opportunity, at last slipped out, under the cover of night, unobserved, and in a few weeks put the Atlantic between herself and five steamers, said to be engaged in searching every nook and corner of the Antilles in quest of her, viz., the "Iroquois," "Keystone State," "Niagara," "Powhatan," and "Jacinto."

The active days of the "Sumter" terminated at Gibraltar, where she arrived in February, 1862. She was an old ship at the outset, had been battered by many storms during her service, and her timbers had been loosened and false keel knocked off by running on a sunken ridge in the shallow approaches to Maranham. A board of survey found her hull unserviceable and her boilers injured beyond repair, and she was laid up for evermore.

She had captured during her cruise, extending from the 30th of June to the 3d of the following January, 18 vessels, 2 of which were retaken, 7 which had been left at Cienfuegos released by the captain-general of Cuba, 4 released on ransom bonds, and 5 burned.

The Confederacy had five cruisers built in England for the special service of preying upon the commerce of the enemy. These were the "Alabama," "Georgia," "Florida," "Rappahannock," and "Shenandoah."

The "Georgia," under command of Capt. Maury, was employed some months in cruising, with more or less success, in 1861–62, but proving deficient in the self-sustaining qualities required by a man-of-war, she was sold out of service.

The "Rappahannock," built late in the war, crossed the Channel to Calais in order to complete her equipment, but the French laws of neutrality so hampered her efforts that it is believed she never put to sea again in the Confederate service.

The "Alabama" was distinguished by her activity and extraordinary success. Her depredations reached an extent that caused her name to be afterwards employed to designate all the losses sustained by the United States from the ships built in British waters, and it is perpetuated both in diplomatic and naval history. Her career is crowded with interesting and instructive incidents for which we can find no place in the few paragraphs we have to devote to her.

She was a small screw-propeller, registering a trifle over 1000 tons, and built at Birkenhead, on the Mersey, with comparatively light scantling, in view of speed rather than strength. She was 222 feet long, with 32 feet beam and 18 feet depth of hold, and drew on the average about 14 feet. She had two horizontal engines of 300 horse-power each, and a capacity for stowing 350 tons of coal, and berthing 120 men. She was bark-rigged, with a liberal breadth of canvas that rendered her largely independent of steam-power, and, taking her all in all, in speed, stability, and all the weatherly qualities essential to a national cruiser, few vessels ever surpassed her.

The "Alabama" came very near having her career nipped in the bud at the very outset. The secret of her destination had been well kept, but no vessel of her construction could fail to awaken strong suspicion in the minds of the British ministry. At last it was determined to seize her. The project took wind and reached the ears of those in charge, who had barely time to save her, by hurrying her equipment and sending her to sea. A few hours after her departure, on the 31st of July, 1862, the ministerial mandate for laying her under embargo reached the customs authorities at Liverpool.

She left ostensibly for a voyage to Nassau, under the charge of an experienced master, and manned by a crew of 70 men. Standing out of British waters, through the north channel of the Irish Sea, she doubled round the north of Ireland and was soon far beyond the reach of municipal processes, with her course shaped for Terceira, one of the Azores, where she dropped her anchor safely on the 10th of August in the roadstead of Porto Praya.

On the 18th she was joined by the English steamer "Agrippina," laden with coal and stores of all kinds, including munitions of war and six 32-pounders, which constituted a part of the battery that was to convert the "Number 290," as she was still called, into a Confederate cruiser.

Two days afterwards, while the transhipment of the "Agrippina's" cargo was in active progress, the steamer "Bahamas" arrived from Liverpool, bringing Capt. Semmes, of Sumter memory, who had been appointed to the command, accompanied by his officers and the rest of the battery, consisting of one 8-inch smooth-bore gun and one 7-inch rifled Blakely.

By the 24th the equipment was completed, and on that day the formalities of inaugurating "No. 290" into the service of the Confederacy took place in the offing, well outside of the marine league that marked the Portuguese jurisdiction. Capt. Semmes, after releasing the assembled crews of his own ship and the "Bahamas" from their articles of shipment, in a short address announced the character and purposes of his command and called for volunteers. Eighty men responded favorably. The English flag, which until now was still waving, was then dropped from the peak, and the ensign of the Confederacy given to the breeze amid the cheers of the new recruits and the firing of guns.

The cruise of the "Alabama," thus prosper-

ously begun off the Azores, carried her over almost every ocean highway pursued by the shipping of the United States. The highest northern latitude she reached was the parallel of 49°. She made her way thence to the West India seas and Gulf of Mexico. When her fortunes began to slacken in those fields she crossed the equator, coasted Brazil as far south nearly as Rio de Janeiro, then, turning eastward, doubled the Cape of Good Hope, and pushed her explorations to the farthest confines of the Indian Ocean.

It is no part of our purpose to follow her in these wanderings. During the nineteen months that her cruise lasted she was, everywhere and at all times, when in the tract of trade, incessantly engaged night and day in forays upon the shipping of the enemy, with a success that was never before equaled by that of any single national cruiser.

She captured in all 63 vessels of every size and description, the estimated value of which amounted in the aggregate to considerably upwards of $4,000,000. Of these prizes, 53 were destroyed, 9 released on ransom bonds, and 1 commissioned as a tender under the name of "Tuscaloosa," and armed with two small pieces of ordnance taken from one of the prizes.

The plans and movements of the "Alabama" were so skillfully conceived and conducted that, in spite of a number of heavy vessels dispatched in pursuit of her, she prosecuted her depredations unmolested in almost every quarter. She was never even sighted by the enemy but on two or three occasions. One of these occurred in November, 1862. While renewing her supply of coal at St. Pierre, Martinique, she was blockaded for a few days by the U. S. steamer "Jacinto," of 14 guns, 12 of which were 68-pounders, and two 11-inch guns. So heavy a force watching for her egress in the immediate offing seemed to threaten an end to her adventures, but she contrived to make good her escape under the cover of night, leaving her enemy ignorant of her departure until the morning revealed it.

During the early part of the following January, while in the Gulf of Mexico, she encountered the U. S. gunboat "Hatteras." The action, fought 38 miles off Galveston, lasted but 13 minutes, and resulted fatally to the Federal ship, which surrendered in a sinking condition, her own and the boats of the "Alabama" rescuing the crew but a few moments before she went to the bottom. The casualties were 2 killed and 5 wounded on board of the "Hatteras," and 2 wounded on board of the "Alabama."

In this contest the superiority in number of guns and weight of metal was with the Confederate vessel, which had also a somewhat larger crew than her opponent.

The "Hatteras" carried a battery of four 32-pounders (37 cwt.), two 30-pounders, rifled, and one 12-pounder howitzer. The armament of the "Alabama" was six 32-pounders (52 cwt.), one rifled 100-pounder, and one 8-inch smooth-bore shell-gun.

Her usual good fortune at last forsook her: she was sunk in her famous action with the "Kearsarge" off Cherbourg, in the British Channel, on the 18th of June, 1864. The engagement took place at an unpropitious moment for the Confederate vessel. She was not in the best fighting order. She had put into Cherbourg on the 4th of June for repairs, battered and worsted by a hundred storms experienced during 19 months of arduous service on every sea. Her boilers were in bad condition: they had to be patched up for the encounter; her engines required thorough overhauling; her copper is described as partially detached in many places to the serious impairment of her speed. She had no longer the alertness and swiftness of her earlier days.

Preparations for docking her had been already set on foot, which were postponed indefinitely by the appearance of the "Kearsarge." That vessel passed defiantly through the harbor without anchoring, and then took up a position in the offing in full sight of her adversary. This manœuvre was regarded as a challenge to battle, and the Confederate commander may well have felt that, after lording it so long over unarmed merchant ships, he could not afford to count closely the odds against him when the gauntlet was cast down by an enemy the world would regard as his equal.

The two ships were nearly of the same size and tonnage, but the Confederate was built, as stated, of slight scantling, while her opponent was stoutly timbered. In addition the latter, though inferior numerically in guns (by one only), carried heavier metal. Her two 11-inch guns gave her a marked preponderance. To crown all, her midship sections were clad with chain-cables enveloped in a wooden casing, while the sides of the "Alabama" were bare of all extraneous defenses.

The field of battle was well outside of the marine league. The contest was witnessed by throngs of spectators lining the French shore, some straggling French pilot-boats, and the "Deerhound," an English yacht.

We can give but a mere outline of the engagement. Besides the advantages mentioned, the "Kearsarge" had the speed of her opponent, and was thus enabled to choose her range. The general manœuvring of both vessels was somewhat unusual. Each tried to get in position for delivering raking fires. This resulted, during nearly the whole combat, in continuous revolutions of the two antagonists round each other in advancing circles and at varying distances, with their heads in opposite directions and their starboard broadsides kept constantly *vis-à-vis.*

The cannonading was furious and incessant on both sides from the beginning to the end, yet withal marked with much coolness and deliberation. The battle lasted about an hour and a quarter. By this time the condition of the "Alabama" was hopeless. Her sides were gaping in wide rents, her fires were out, her steam down, many of her men were killed and wounded, and with her hold filled with water from a gaining leak, she was visibly sinking. Add to all this, the "Kearsarge" was now getting into position for pouring in raking fires, from which there was no escape, and which she was powerless to return.

In this desperate extremity nothing was left but to haul down the Confederate flag. Scarcely had it disappeared before the "Alabama" went to the bottom, stern foremost, leaving all the officers and crew, except the wounded, who had been passed into a boat before the final catastrophe, struggling for life in the sea. The English

yacht, referred to above, hastened to the rescue, and saved many lives, including that of the commander. The boats of the "Kearsarge" also put forth their best efforts in this office of humanity.

The officers of the "Alabama" felt, on touching the deck of the yacht, that it was at least some alleviation to their defeat that the waves had cast them upon British territory. They had never been in the custody of their conquerors, and, not regarding themselves as prisoners even in a strained and technical sense, they felt free to avail themselves of the refuge they had reached and were landed in England.

The armament of the "Alabama" in this conflict consisted of one 7-inch rifled Blakely, one 8-inch smooth-bore pivot-gun, and six 32-pounder smooth-bore broadside guns. Her crew amounted to 120 men.

The "Kearsarge" carried a battery of two 11-inch Dahlgrens, four 32-pounders, and one light rifled 28-pounder. Her crew, in officers and men, is stated to have been 162.

The loss of the Confederates in killed and wounded was 28, of whom 7 were killed; the loss by drowning was 19. The "Kearsarge" is alleged to have come out of the fight without serious damage or the loss of a single life.

The "Florida," originally the "Oreta," under the command of Lieut. Commanding Maffitt, took an active part in the devastation of the commerce of the enemy. She was a small bark-rigged propeller of 560 tons, mounted with engines of 240 horse-power. She sailed from Liverpool, where she was built, on the 18th February, 1862, in ballast, bound to Nassau, where she arrived about the 20th of April. She was here seized by H. M. ship "Greyhound" upon the charge of violating the British Foreign Enlistment Act, but released by the Admiralty Court after a short detention. The 7th of August found her at a small rocky islet called Green Cay, some 60 miles to the southward and eastward of Nassau, busy receiving her stores and ammunition and mounting her battery, which had all been brought from Nassau under preconcerted arrangements. Her armament consisted of two Blakely 7-inch pivot-guns, and six short Low More 7-inch broadside guns.

Sailing from Green Cay on the 20th, the yellow fever in its most malignant form broke out on board on the following day, and forced her to make harbor at Cardenas, Cuba, where the epidemic swept off two-thirds of her crew. It became necessary in this crippled condition to seek a Confederate port, and on the 4th of September the "Florida" ran into Mobile Bay through the blockading force, receiving some damage from their fire. Refitted and provided with a full crew, she put to sea again early in January, 1863, in a northeast gale, again dashed through the blockading force, now much strengthened, and entered upon destructive voyages which lasted many months, and extended from the latitude of New York to the equator.

Ultimately the cruise of the "Florida," now commanded by Lieut. Commanding Morris, was brought to a disastrous and sudden termination on the 7th of October, 1864, in the harbor of Bahia, Brazil. She had been preceded in her arrival at this port by the U. S. steamer "Wachusett." Capt. Morris, confiding in the neutrality of a friendly harbor, whose hospitalities both vessels were enjoying, took up his quarters on shore himself and allowed half of his crew to go on liberty. While his vessel lay in this defenseless condition she was overpowered, after a brief resistance, in a night attack made by the "Wachusett," captured, and towed to sea. This violation of both international and municipal laws caused Brazil to make prompt reclamations against the United States, in which she insisted upon the restoration of the vessel in *statu quo* to the waters from which she had been taken. During the pendency of this demand the "Florida" was run down and sunk, accidentally it is alleged, while in tow of a vessel belonging to the U. S. squadron in the lower waters of the Chesapeake.

The "Shenandoah" ("Sea King"), commanded by Capt. Waddell, was commissioned in October, 1864. She was a Clyde-built auxiliary screw-ship with an iron frame and teak planking, measuring 900 tons, and carrying a battery of two 32-pounders, rifled, four shell-guns (57 cwt.), and two 22-pounders. She entered upon her cruise with but 13 men, besides the regular staff of officers, trusting to recruiting a full complement by volunteers from captures, and from this source eventually swelled her force to 100.

Her cruise extended into every navigable sea, except the Antarctic, and carried her through Behring Strait into the Arctic Ocean, where she reached to within 20 miles of the 67th parallel of latitude, where her progress was blocked by ice. Her entire cruise occupied 13 months, during eight of which she was actively employed. She added to the list of captures 38 valuable prizes, 6 of which were released on bonds and the remainder destroyed.

Intelligence of the fall of the Confederacy reached the commander of the "Shenandoah" while cruising off San Francisco, on the 2d of August, 1865. He thereupon proceeded to carry his denationalized command, by the way of Cape Horn, to Liverpool, which place he reached in November, and surrendered her to her majesty's government, which transferred her to the possession of the United States.

Eventually, the Confederate navy, at least that portion of it in her own waters, passed out of existence piecemeal. It was a natural pride that prompted the determination in the last strait to destroy the ships rather than leave them as trophies to swell the triumph of the victors. As city after city fell along the coast, the final act before evacuating each was to set fire to the public vessels, and when, after the abandonment of Richmond, the Federals took possession, they found the James strewed with the fragments of the "New Virginia," the "Richmond," and the "Fredericksburg," all ironclads, and about six wooden gunboats, the last remnant of the Southern navy, save one only cruiser on the high seas, the "Shenandoah," which at the moment was unconsciously floating at her gaff the flag of a nation well-nigh passing away.—*C. H. McBlair, late Captain C.S.N.*

Navy Department. By an act of Congress, approved April 30, 1798, there was established "an executive department to be denominated the Department of the Navy," and the chief officer of it was therein directed to be called the "Secretary of the Navy."

During the Revolutionary war Congress had the superintendence of the navy, and appointed, in October, 1775, Messrs. Deane, Langdon, and Gadsden, members of Congress, the "Marine Committee." On December 13 of that year Congress enlarged and re-constituted the committee, by ballot, from its own members, as follows: Messrs. Bartlett, Hancock, Hopkins, Deane, Lewis, Crane, Robert Morris, Read, Chase, R. H. Lee, Hewes, Gadsden, and Houston. While this committee examined and reported on all naval matters, Congress appointed all commissioned officers, but gave the committee power to appoint all officers of subordinate rank, and authorized it to give instructions for the employment of ships.

By a resolution of Congress, approved November 6, 1776, it was ordered that three persons well skilled in maritime affairs should be immediately appointed to execute the business of the navy under the direction of the "Marine Committee," and John Nixon, John Wharton, and F. Hopkinson were appointed. These experts, or advisory persons, were called "The Continental Navy Board," or "Board of Assistants to the Marine Committee," and sometimes the "Board of the Middle District." There was also an "Eastern Board," consisting of three persons, who executed the instructions of the committee, in their district.

The act of October 28, 1779, established a "Board of Admiralty," to consist of three persons not members of Congress, and two members of Congress; and on the 11th of January, 1781, Congress, by resolution, invested James Reed with full power to conduct the business of the Navy Board in the middle department, and on February 27 of that year Major-General Alexander McDougall was appointed "Secretary of Marine" under the act of February 7, 1781. This management continued but a short time, for, August 29 of that year, Congress resolved that the functions and appointments of the Board of Admiralty, the several navy boards, and all civil officers appointed under them should cease, and an "Agent of Marine" should be appointed, and on September 6 following Robert Morris, Superintendent of Finance, was assigned those duties. He continued the superintendence and management of the navy for nearly eight years. The act of August 7, 1789, charged the Secretary of War with the performance and execution of such duties relative to the naval forces, or to such other matters respecting naval affairs, as the President of the United States assigned him.

It was not until nine years had elapsed that these duties of the Secretary of War ceased, when the act of April 30, 1798, established the "Department of the Navy," or, as it is now called, the "Navy Department," and created the office of "Secretary of the Navy."

The Secretary of the Navy is appointed by the President, by and with the advice and consent of the Senate, and is a member of his Cabinet. George Cabot, of Massachusetts, was appointed the first Secretary of the Navy, but he declined, and Benjamin Stoddert, of Maryland (a resident of Georgetown, D. C., at the time of his appointment), was appointed. The Secretaries of the Navy, in the order of appointment, are as follows:

Name.	State.	Date of Appointment.	By whom Appointed.
George Cabot*	Mass.	May 3, 1798	John Adams.
Benj. Stoddert	Md.	May 21, 1798	
Robert Smith	Md.	Jan. 26, 1802	Thomas Jefferson.
Paul Hamilton	S. C.	Jan. 7, 1809	James Madison.
William Jones	Pa.	Jan. 12, 1813	
R.W. Crowninshield	Mass.	Dec. 19, 1814	
Smith Thompson	N. Y.	Nov. 30, 1818	James Monroe.
Samuel L. Southard	N. J.	Dec. 9, 1823	
John Branch	N. C.	March 7, 1829	Andrew Jackson.
Levi Woodbury	N. H.	May 23, 1831	
Mahlon Dickerson	N. J.	June 30, 1834	
James K. Paulding	N. Y.	July 1, 1838	Martin Van Buren.
George E. Badger	N. C.	March 5, 1841	Wm. H. Harrison.
Abel P. Upshur	Va.	Sept. 13, 1841	John Tyler.
David Henshaw†	Mass.	July 24, 1843	
Thos. W. Gilmer‡	Va.	Feb. 15, 1844	
Lewis Warrington	U.S.N.	*ad interim*	
John Y. Mason	Va.	March 14, 1844	
George Bancroft	Mass.	March 11, 1845	James K. Polk.
John Y. Mason	Va.	Sept. 10, 1846	
Wm. B. Preston	Va.	March 8, 1849	Zachary Taylor.
Wm. A. Graham	N. C.	Aug. 1, 1850	Millard Fillmore.
John P. Kennedy	Md.	July 26, 1852	
James C. Dobbin	N. C.	March 8, 1853	Franklin Pierce.
Isaac Toucey	Conn.	March 7, 1857	James Buchanan.
Gideon Welles	Conn.	March 7, 1861	A. Lincoln. Andrew Johnson.
Adolph E. Borie	Pa.	March 9, 1869	Ulysses S. Grant.
Geo. M. Robeson	N. J.	June 26, 1869	Ulysses S. Grant.
Rich. W. Thompson	Ind.	March 13, 1877	R. B. Hayes.

By the act approved February 7, 1815, a *Board of Commissioners for the Navy of the United States* was constituted, but the act provided that nothing in it should be construed to take from the Secretary of the Navy his control and direction of the naval forces of the United States as now by law possessed. This act was repealed August 31, 1842, and the following-named bureaus were established: 1. Navy-Yards and Docks. 2. Construction, Equipment, and Repairs. 3. Provisions and Clothing. 4. Ordnance and Hydrography. 5. Medicine and Surgery. This organization was continued until, by the act of July 5, 1862, the number of bureaus was increased and their titles established, as follows: 1. Yards and Docks. 2. Equipment and Recruiting. 3. Navigation. 4. Ordnance. 5. Construction and Repair. 6. Steam Engineering. 7. Provisions and Clothing. 8. Medicine and Surgery.

The duties of these bureaus are indicated by their titles; their chiefs are officers of the navy appointed by the President, by and with the advice and consent of the Senate. In addition to the duties of the chief of Bureau of Navigation, he is head of the "Office of Detail," and has, under and by direction of the Secretary of the Navy, the detailing and ordering of officers for duty at navy-yards and stations, on vessels, etc.

The chief clerk of the Navy Department has the care and custody of the files and records of the Department, the general supervision of its correspondence, and such other duties as the Secretary assigns him.

The office of "Assistant Secretary of the Navy" was created by the act of July 31, 1861, and abolished by the act of March 3, 1869. The following-named gentlemen held that office: Gustavus V. Fox, of Massachusetts, from August 1, 1861, until May 31, 1866; William Faxon, of Connecticut, from June 1, 1866, until March 3, 1869.

The office of "Solicitor and Judge-Advocate"

* Declined.
† Not confirmed by Senate.
‡ Killed on board "Princeton," February 28, 1844.

was created by the act of March 2, 1865, and finally abolished by the act of June 19, 1878. The following-named gentlemen held that office: William E. Chandler, of New Hampshire, appointed March 9, 1865; and John A. Bolles, of Massachusetts, appointed June 10, 1865, and died June, 1878.—*Jesse E. Dow.*

Navy-yard, Boston, Mass. The navy-yard at Boston, Mass., is situated at the confluence of the Charles and Mystic Rivers, on land formerly known as Moulton's Point. Jurisdiction was ceded by the State of Massachusetts to the United States in 1800 over an area of 65 acres, and there was purchased for the government in that year, by Dr. Aaron Putnam, 35 acres for $37,356. This area has been increased by subsequent purchases of 5186 square feet from Capt. Isaac Hull, August 15, 1817, for $3889.50, and 115,210½ square feet from Oakman and Eldridge, June 1, 1863, for $123,100. This, with the filling in of the flats and marsh, makes an area of 87¼ acres in 1880. It is surrounded on the land side with a substantial granite wall 12 feet high, that was built in 1825–26, with a water frontage of 8270 feet, which includes 5214 feet of wharfage; it has 3 building-slips, 4 ship-houses—making 7 building-ways. There is a timber-dock at the eastern end of the yard that has an area of 5 acres 36 rods. In the upper part of the yard there are 2 wet-basins, which are only separated by a roadway; one of them contains an area of 2½ acres, the other 4½ acres, capable of being adapted for an extensive system of dockage. There are now (1880) inside of the walls 20 brick, 11 stone, 36 wooden, and 2 iron buildings, with 4 regular timber-sheds, besides numerous outhouses and temporary buildings. Only 8 buildings are standing that were on the yard plan for 1823. The oldest is No. 5, built in 1803 of brick for a store-house, offices, sail-loft, etc., now occupied in part by the naval library and institute, museum, court-martial room, dispensary, offices, etc., and the dwelling-house for the commandant, which was finished in 1809. There are two fine avenues running lengthwise of the yard, ornamented with shade-trees. The commandant's office is in a small one-story wooden building located near the centre of the yard on the main avenue.

There have been 22 regular commandants, viz.: Samuel Nicholson was the first (1800). He died in command December 29, 1811. William Bainbridge (who was in command three separate terms), Isaac Hull, William Crane, Charles Morris, Jesse D. Elliott, John Downes (twice), John B. Nicholson, Foxhall A. Parker, Francis H. Gregory, Silas H. Stringham (twice), William L. Hudson, John B. Montgomery, John Rodgers, Charles Steedman, Enoch G. Parrott, Edward T. Nichols, Foxhall A. Parker (2d), William F. Spicer (who died in command Nov. 29, 1878), and the present commandant, George M. Ransom. There were two of the executive-officers in command for over three months, and one for over two months, during the interval of appointment or continued absence of the regular commandants, viz.: William B. Shubrick, Josiah Tattnall, and Milton Haxtun.

In 1802, by order of the Secretary of the Navy, 5 acres of land in the northeast corner of the yard was assigned to the Treasury Department for a marine hospital, on which a hospital with all of the necessary outbuildings was erected, and inclosed with a picket-fence from the navy-yard. April 30, 1825, this property was transferred to the Navy Department upon payment to the Treasury Department of $12,875, the estimated value of the buildings thereon, and a marine hospital was erected in Chelsea. The work of tearing down the old hospital began August 15, 1825, and on its site was erected a block of 4 brick dwelling-houses, facing the yard, with the stone wall running along the Salem turnpike in their rear. This was changed in 1836–37 by facing the buildings outwardly to the turnpike, and erecting the wall around them in their rear and an iron picket-fence in front. They were first occupied in August, 1826, by Master-Commandant Kearney, Surgeon John A. Kearney, Sailing-Master Knox, and Naval Storekeeper George Bates. They are now allotted to the captain of the yard, ordnance-officer, naval constructor, and surgeon of the yard.

The 5 brick dwelling-houses near the main gate, western entrance, were erected in 1833 for the warrant-officers. They were first occupied by Boatswain W. Hart, Gunner W. B. Brown, Carpenter Calvin Oaks, Sailmaker S. B. Banister, and Sailing-Master C. W. Waldo, check-officer. They are now occupied by the paymaster of the yard, equipment-officer, civil engineer, steam engineer, and pay director in charge of provisions and clothing.

The mail messenger lives in the brick house next the main gate, and the apothecary has rooms assigned him in building No. 5. These are all who live within the walls except the marines.

The marine barracks is a three-story brick building, in line with the wall on Chelsea Street, between the commandant's house and the rope-walk. It occupies an area, including the parade-ground, of 1¼ acres and can accommodate 250 marines, with the necessary complement of offices.

The rope-walk is the finest in the country; it was built, in 1836, of rough ashlar granite; it runs parallel with the wall on Chelsea Street, and is 1360 feet long, with a laying-ground 1253 feet by 45. The second story is 748 feet long; it was built in 1856; and the head-house is three stories, 60 by 70 feet, slated roofs; it has 2 double engines, one of 200 horse-power, the other 150 horse-power, capable of manufacturing 2500 tons per year of all kind and sizes of rope. There is a fire-proof store-house for the hemp and a tar-house, both built of granite.

The two-story brick building to the eastward, in line with the wall, was arranged for the manufacture of wire rigging, etc., in 1873; it is 186 by 38 feet; it has an engine of 80 horse-power, and can produce 500 tons per year of all kind of wire-rigging, besides green hide rope in sufficient quantities to supply the wants of the service.

In the boiler-house, which is built of brick, 55 by 44 feet, one story, are 8 boilers, each independent of the others; these supply the steam for the engines in the rope-walk and wire-shop.

The steam-engineering building, erected in 1856, is built of brick, with granite trimmings. It is in form a parallelogram, and covers an area of 135,755 square feet. It contains a brass- and iron-foundry, boiler-, blacksmith-, and machine-shops; these are filled with all the necessary

tools, appliances, and machinery required for an extensive business; there are 2 engines of 100 horse-power each in the building. The boiler-house and chimney are in the centre; there are 8 boilers that work in pairs, and 5 donkey-pumps. The chimney is 239½ feet high; it was finished October 7, 1858.

The rolling-mill is built of brick, 207 by 86 feet, and has an engine of 100 horse-power to work the necessary machinery.

One iron building is occupied by the Thilmany process for wood preserving; it can turn out 1000 cubic feet per day.

The dry-dock was begun July 10, 1827, under the superintendence of Laomi Baldwin, and finished in June, 1833. It is built of hammered granite in a substantial manner, with a great arch 60 feet in width. It was originally 305 feet long by 86 feet wide, and cost $679,000; in 1857–58, however, it was extended 65 feet in length at an expense of $314,825, making its total length 370 feet, and its entire cost $993,915. It has a capacity, with average high-tide, of 5,764,500 gallons. The head-house was built, in 1832, of granite, and is occupied, in part, by the engine which pumps out the dock. This engine was manufactured at Hartford, Conn., in 1855; it has a cylinder 20 inches in diameter, with 84-inch length of stroke, makes 25 revolutions per minute, capable of throwing 800 gallons per revolution from the 2 pumps connected with it. The average time it takes to pump out the dock with 25 feet of water is about 4 hours. There is, also, a donkey-pump connected with the above, with a pumping capacity of 160 gallons per minute. The first vessel put into this dock was the "Constitution" ("Old Ironsides"), June 24, 1833, and its present occupant is the "Hartford,"—the two most famous vessels in the navy.

Construction occupies several buildings. The mast-shop, the most easterly building in the yard, is of wood, slated; the molding-loft, boat- and carpenter-shops are of granite; the joiner-shop, of the same, with an engine of 100 horse-power. The saw-mill is of wood, and has an engine of 100 horse-power. Two masting-shears, one of 130 feet in height, will hoist 80 tons; the small shears at the lower part of the yard is 105 feet high, and will hoist 60 tons.

The store-houses of equipment, steam-engineering, provisions and clothing, and yards and docks are all built of granite in a substantial manner. The ordnance building is of brick, with granite trimmings, 274 by 90 feet; it has an engine of 100 horse-power. The coal- and boiler-house, 50 by 64 feet, contains 4 boilers. There are 2 brick shell-houses. The magazine is on the hospital grounds in Chelsea, and the nitre depot in Malden, Mass. There is a gun-park, 363 by 124 feet; it has 6 skids, built of granite, with iron rails running lengthwise; a shot-park, 317 by 125 feet. There is a saluting battery of 30 guns on the quay-wall, with a small magazine to hold saluting powder. A railroad track was laid in 1863 the length of the yard; it is connected with the Fitchburg road. For putting out fires there are 2 steam fire-engines, 9 hose-carriages, 1 hook-and-ladder truck, and 24 chemical extinguishers in the yard.

Thirty-nine ships-of-war have been launched at this yard. The "Frolic," in 1813, was the first one; "Independence," June 22, 1814; "Alligator," November 4, 1820; "Boston," October 15, 1825; "Warren," November 29, 1826; "Falmouth," November 3, 1827; "Boxer," November 22, 1831; "Porpoise," May 31, "Pioneer," October 25, "Consort," October 29, 1836; "Cyane," December 2, 1837; "Marion," April 24, 1839; "Bainbridge," April 26, 1842; "Erie," 1842 (a sloop-of-war same name was launched in 1813, rebuilt in 1820 at a cost of $56,174, and broken up at Boston in 1841 and this store-ship constructed); "Cumberland," May 24, 1842 (keel laid in 1825); "Plymouth," October 11, 1843; "Vermont," September 14, 1848 (keel laid in 1818); "Princeton," October 29, 1851; "Merrimac," June 14, 1855; "Hartford," November 22, 1858; "Narragansett," February 15, 1859; "Wachusett," October 10, "Housatonic," November 20, "Maritanza," November 26, 1861; "Canandaigua," March 28, "Genesee," April 2, "Tioga," April 18, 1862; "Tallapoosa," February 17, "Pequot," June 4, "Winooski," July 30, "Saco," August 28, 1863; "Monadnock," a double-turreted ironclad, March 23, "Ammonoosuc," July 21, 1864,—name changed in 1869 to "Iowa"; "Guerriere," September 9, 1865; "Manitou," August 25, 1866,—name changed in 1869 to "Worcester"; "Nantasket," August 15, 1867; "Alaska," October 31, 1868; "Intrepid," iron torpedo-boat, March 5, 1874; "Vandalia," October 23, 1874, was the last one launched. Several vessels were built for the treasury, light-house, and survey, such as the brig "Apprentice," "John Hancock," "Bibb," "Cohassett," "Blue Light," etc.

There are now on the stocks at this yard the "Virginia" (keel laid in 1818); "Connecticut" (keel laid January 2, 1864); "Oregon," monitor, double-turreted ironclad (keel laid April 15, 1864); and the "Pennsylvania" (keel laid in 1865).

The "Niagara," "Iowa," "Ossipee," and "Ohio" are in ordinary. The "Hartford" is under repairs, and the "Cohassett" is employed as the yard tug-boat. The U. S. receiving-ship "Wabash" lies off the yard.—*A. H. Massie.*

Navy-yard, Brooklyn. The Brooklyn Navy-Yard, known officially as the New York Navy-Yard, is situated on Wallabout Bay, East River. This bay is about half a mile wide and nearly semicircular in shape, the greater portion of it being occupied by an island, 31 acres in extent, known as the Cob Dock; the channel between the Cob Dock and the yard proper is 400 feet wide, and upon it is most of the water front of the yard, which includes more than a mile of the most eligible wharfage in the harbor of New York. The total area of the yard, including the Cob Dock and the Naval Hospital grounds, is 199.77 acres, of which but about 45 acres are comprised in the yard proper, and occupied by buildings, wharves, docks, etc.

During the Revolutionary war the "Old Jersey" and other prison-ships were moored in the Wallabout, and the shores of the bay were used as a burying-place for the thousands of Americans who died on board them. Toward the close of the last century John Jackson established a ship-yard on the west side of Wallabout Bay, and in 1799 he built for the United States a small frigate, called the "Adams," which was the first man-of-war launched at the site of the present yard. In 1801 Jackson disposed of his

property, about 30 acres, to the government for $40,000; in 1824 the piece of land now occupied by the U. S. Naval Hospital, some 35 acres, was purchased for $7650, and in 1848 the intervening portion was obtained for $285,000; finally, in 1867, an irregular piece of land on the northwest corner was bought for $90,000. Excepting the hill on which the commandant's house stands, and that where the hospital is built, this property was originally little more than a mud flat.

Immediately after the purchase in 1801, Lieut. Jonathan Thorne was ordered in charge, and remained until 1806, nothing being done meanwhile to improve the property. He has been succeeded by the following commandants, who took charge at the dates mentioned:

Captain Isaac Chauncey, 1806.
Captain Samuel Evans, 1812.
Captain Isaac Chauncey again in 1824.
Captain Charles G. Ridgely, July, 1833.
Captain James Renshaw, November, 1839.
Captain M. C. Perry, June, 1841.
Captain Silas H. Stringham, July, 1843.
Captain Isaac McKeever, September, 1846.
Captain Wm. B. Salter, October, 1849.
Captain Charles Boorman, October, 1852.
Captain Abram Bigelow, October, 1855.
Captain Lawrence Kearney, February, 1857.
Captain S. L. Breese, November, 1858.
Rear-Admiral Hiram Paulding, October, 1861.
Rear-Admiral Charles H. Bell, May, 1865.
Rear-Admiral S. W. Godon, July, 1868.
Rear-Admiral Melancthon Smith, October, 1870.
Vice-Admiral S. C. Rowan, June, 1872.
Commodore J. W. A. Nicholson, September, 1876.
Commodore George H. Cooper, May, 1880.

In 1806–7 the present commandant's house was built, 6 brick buildings for store-houses and offices were commenced, and by the sale of chips money was obtained to build the stone embankments to the terraces on the hill. During the war of 1812 over 100 vessels were fitted for sea, supplied with stores, etc. In 1829 the "Fulton," the first steam war-vessel, which had been built in 1815, was accidentally destroyed by the explosion of her magazine while she was at anchor off the yard. Among other vessels launched were the "Ohio," in 1820; the "Savannah," begun in 1822, but not launched until 1842; the notorious brig "Somers," in 1842; and the ill-fated "Albany," in 1846. The stone dry-dock, begun in 1841, was not finished until 1851. It is built of granite, and cost $2,113,173; its main chamber is 285 by 35 feet at the bottom and 307 by 98 feet at the top, and its depth is 36 feet; it can be emptied by steam-pumps in 2½ hours. During the civil war 14 vessels were built and over 400 fitted out; the number of men employed increased from 1650 in 1861 to over 6000 in 1863; and in 1865 an average of 5000 was employed, and the pay-roll was $3,952,000, work never ceasing day or night; at present there are about 600 workmen.

Since the war but two new vessels have been built, the "Trenton" and the torpedo ram "Alarm," but many improvements have been made, and some fine buildings added; the streets have been graded, paved, and sewered, and hundreds of trees planted; the Cob Dock has been made attractive with trees, grass, and flowers, and Sailors' Hall built for the accommodation of the recruits on the receiving-ships. It has bath-rooms and a barber-shop on the lower floor, and a library, reading-room, and stage for amateur performances on the upper.

The Naval Lyceum, founded by officers in 1833, is one of the attractions of the yard. It has a library of 5000 volumes, a large collection of curiosities, and valuable cabinets of coins, minerals, etc. On the eastern side of the yard is the naval hospital, a fine building, with a capacity for 500 patients. In the same grounds are the naval laboratory and the naval cemetery. The marine barracks, with their parade-ground, cover 6½ acres, and have accommodations for 750 men. The old line-of-battle ship "Vermont" and the steam-frigate "Colorado" are used as receiving-ships, and are moored to the Cob Dock; they can berth 2000 men. The whole number of buildings in the yard, including 2 ship-houses and 10 houses for officers, is over 80. The yard fire department includes 2 steam fire-engines and a complete system of fire-alarm telegraph. For a fuller account of the New York Navy-Yard, see "Lecture by Commodore J. W. A. Nicholson before the Long Island Historical Society," from which much of this article is compiled.—*F. Hanford, Lieutenant U.S.N.*

Navy-yard, League Island, Pa., is situated on League Island, in the Delaware River, the western extremity of the island being nearly opposite the mouth of the Schuylkill River, and it extends easterly about 2¼ miles; the extension of Broad Street, of the city of Philadelphia, would pass nearly across the centre of the island, and the main entrance of the yard is at the foot of that street. The entire island, which is now the property of the government, consists of,—area within dikes, 410 acres; area between the banks of the back channel, 305.5 acres; area between the back channel and Government Avenue (the northern boundary-line of the property), 37.25 acres; area outside of dikes to wharf-line, 170.25 acres; making in the aggregate an area of 923 acres. The dikes are absolutely necessary, as the natural surface of the island is about 3½ feet below high-water mark; the land is also ditched, and the ditches connect with tide-gates, so that any water accumulating from rains or other sources passes out at low-tide. Owing to the recent establishment of this yard very few buildings have been erected as yet. At the main entrance on the right is a porter's lodge, and on the left a guard-house; the other buildings on the right of the main avenue are a very neat and attractive residence lately occupied by the civil engineer of the yard, the surgeon's office, commandant's office, naval constructor's offices and shops. The ship-house, which was blown down by a severe storm about two years ago, has not yet (1880) been rebuilt. The machine-shops, gun-park, and stables are on the left side of the main avenue. The quarters of the marine guard of the yard are located in the hull of the frigate "Antietam." The location of this yard is admirably adapted for ship-building and repairing, as it has sufficient depth of water on the river front to float the largest vessels in the navy, and it should certainly have a sufficient amount of money appropriated by Congress to make it one of the finest navy-yards in the world.

Navy-yard, Mare Island, Cal. This navy-

yard is situated on Mare Island, which forms a portion of the eastern side of San Pablo Bay, its southernly end making the intersection of the Strait of Carquinez and Mare Island Strait. The former is the outlet of the two largest rivers of California, the Sacramento and San Joaquin, and the latter constitutes the improved front of the navy-yard, as well as that of the city of Vallejo, on the opposite shore, and also the outlet of the Napa Creek, which drains the fertile valley above. The distance from San Francisco is 26 miles. The island is about 2½ miles long, with an area of about 1000 acres of upland, to which may be added some 2000 acres of tule land adjoining it on the north, also belonging to the United States. The highest point of the island has an altitude of 280 feet. The soil has a rocky foundation, very suitable to sustain the weight of the heavy structures required in a naval dock-yard.

The position is well adapted for a naval station. The harbor is completely land-locked, easy of access, with excellent anchorage, deep water, large capacity, and is free from the teredo and other destructive marine worms. It is well located for protection in war, being within the defenses of the harbor of San Francisco. It is convenient of access by land, as the railroad systems of the Pacific coast form a focus on the shore of the Strait of Carquinez, 1 mile distant from the island.

The principal structures are:

The sectional dock, which has been used for raising the largest vessels during the past 25 years.

The stone dry-dock, now in course of construction, of capacity sufficient for docking the largest ships.

The foundry and machine-shop.

The construction workshops.

The smithery.

The blacksmith's shops.

The sail-loft.

The rigging-loft.

The yards and docks workshops.

The iron-plating shop.

The saw-mill and the timber-shed, all of large capacity and well adapted to the purposes for which they were designed.

The office building, in which the commandant's and other offices are located, occupies a prominent position.

The officers' quarters, including the residence of the commandant, are built on a beautiful avenue some distance from the water front.

The navigation store-house, and the ordnance store-houses and magazines, are well located, and kept in a high state of efficiency.

The marine barracks and U. S. naval hospital are eligibly located on the island.

The report of the Secretary of the Navy, 1878, shows the approximate value of property belonging to the navy at this yard to be $7,181,-720.78, and his report for 1879 remarks: "The great importance of this yard commends it to the special consideration of Congress. It being the only one on our Pacific coast, it is the exclusive representative of the Department in repairing vessels attached to the Pacific and Asiatic Squadrons."

The navy-yard was established on this island in the year 1854, Admiral (then Commander) D. G. Farragut having assumed command in September of that year.

The following is a list of commandants and date of assuming command:

Commander D. G. Farragut, September 16, 1854.
Captain R. B. Cunningham, July 16, 1858.
Captain David McDougal, March 13, 1861.
Captain W. H. Gardner, June 5, 1861.
Captain Thomas O. Selfridge, May 27, 1862.
Captain D. McDougal, October 17, 1864.
Commodore T. T. Craven, September 5, 1866.
Commodore James Alden, August 1, 1868.
Captain Reed Werden, March 17, 1869.
Rear-Admiral T. T. Craven, April 15, 1869.
Commodore J. R. Goldsborough, January 1, 1870.
Commodore E. G. Parrott, April 15, 1871.
Rear-Admiral T. O. Selfridge, September 3, 1872.
Rear-Admiral John Rodgers, July 3, 1873.
Commodore E. R. Colhoun, April 17, 1877.

The following vessels were reported at this navy-yard in July, 1880, viz.: "Mohican," rebuilding; "Monadnock," rebuilding; "Benicia," in ordinary; "Independence," receiving-ship; "Cyane," in ordinary; "Iroquois," under repairs; "Saco," in ordinary; "Narragansett," in ordinary; "Camanche," in ordinary; "Nyack," in ordinary; "Monterey," tug in yard service; "Mohican" (old), in ordinary; "Monadnock" (old), in ordinary; "Monongahela," in ordinary; "Ranger," under repairs; "Tuscarora," under repairs; and the flag-ship "Pensacola."—*E. R. Colhoun, Commodore U.S.N.*

Navy-yard (Gosport), Norfolk, Va. No navy-yard belonging to the United States, from its geographical position, is more important than that at Gosport, Va. Located near enough to the entrance of the Chesapeake Bay to be easily accessible, it is, at the same time, in a position readily defended from attacks either by land or by water, and, as has been repeatedly shown, can be held by a small force against a very largely superior one. There is in the vicinity an abundant supply of timber and other material, while the close proximity of a populous city secures to it the command of all the skilled labor that can be required. Such is the mildness of the climate, that work of all sorts can be carried on at all seasons of the year without interruption. Hampton Roads, the outer harbor, is an excellent point of rendezvous for a fleet or squadron.

A glance at the map will demonstrate the very great importance of a naval station in this vicinity. The Chesapeake, with its navigable tributaries, penetrates into the heart of several of the richest States in the Union, reaching to the national capital. A foothold in its waters would, therefore, be of the utmost strategic importance to an invading enemy, and would probably be one of the earliest objects sought by them, as past history has fully shown. The width of the entrance of the bay is so great that it would be impossible to defend it except by a naval force, which should have a repairing, coaling, and victualing station as near at hand as possible, consistent with entire defensibility for itself, with a reasonably secure outer harbor, large enough for the necessary manœuvres of a squadron in getting under way and forming. All of these conditions are admirably filled by the location of the Gosport Yard.

Just before the breaking out of the war of the Revolution, the British established a marine-

yard, for the use of their navy, on the site of the present navy-yard at Gosport (as that portion of Portsmouth has always been called), having, as is stated in a letter now on file in the Navy Department, written in 1824, by Miles King, United States navy-agent, selected this point, after a careful survey of all the ports within its dominions in North America, as the most eligible situation for a naval station. The name of Gosport was doubtless taken from Gosport, near Portsmouth, England, where one of the most important of the British dock-yards is located. There is a tradition that this spot had been used for some time by the British as a careening-ground for their ships, but the writer has not been able to find any proof of the fact. Mr. King's letter further states that scarcely had the British government commenced the works when the Revolution began, and the yard, together with the adjoining property of Andrew Sprowle, the British navy-agent, became confiscate and forfeited to the State of Virginia.

Virginia immediately commenced preparations for establishing a navy, and vigorous measures were adopted to that end. Several vessels were built or purchased. A rope-walk was established, which was probably at Gosport, though it is not certain. The published histories of Virginia and of the U. S. navy are alike singularly silent upon the subject of the Virginia navy, which was employed mainly for the defense of the bays and rivers of the State. Commodore Barron was appointed its commander-in-chief, being styled "Commodore of all the armed vessels of the Commonwealth." His two sons, Samuel and James Barron, and also Richard Dale, all afterwards distinguished officers of the U. S. navy, served under his command. At the conclusion of the war the State navy was disbanded.

The marine-yard was retained for the benefit of the Commonwealth, though no use is known to have been made of it until the year 1794. The lands adjoining the yard were sold in 1785. It was lent to the government by the State of Virginia, and was purchased by the United States several years later. Capt. Richard Dale* was appointed superintendent of the yard; Josiah Fox, naval constructor or master-builder; and William Pennock, navy-agent.

By an act of Congress passed March 27, 1794, the President had been authorized to procure by purchase or otherwise, equip, and employ to protect our commerce from the Algerines, 4 ships of 44 guns each, and 2 ships of 36 guns each. One of the ships thus authorized was laid down at the Gosport yard. Various causes combined to delay its completion, and at the end of the year 1795 it was still unfinished.

In a report of the Secretary of War, dated December 12 of that year, it is stated that about two-thirds of the live-oak frame of the frigate at Norfolk (Gosport) had been received, a part of the planking, the copper for sheathing and fastening, most of the iron-work, the masts and spars, and the most of the other materials necessary were in store or getting ready. The keel had been laid, and part of the frame bolted together ready for raising.

On the establishment of peace, early in 1796, between the United States and Algiers, work was suspended upon the ship at this yard, and such of the materials collected as were thought perishable were sold, and the rest put in store, Mr. Pennock, the agent, being employed to take charge of them. In June, 1797, the materials on hand at Gosport were valued at $52,989.

In July, orders were sent to Mr. Pennock to recommence work on the frigate at Gosport, for which the name "Chesapeake" had been chosen. During the same month, a brig of 200 tons, which had been built near the navy-yard, by Mr. Herbert, and which was nearly ready for launching, was purchased by the government and fitted out, under the name of "Norfolk." Capt. Thomas Williams, of Norfolk, was appointed superintendent, and afterward commander of the brig, being regularly commissioned in the navy.

Mr. Josiah Fox, who had been discharged from the yard upon the suspension of work in March, 1796, was now reappointed as naval constructor, and directed to proceed with the work upon the "Chesapeake," on a plan proposed by himself, by which the size of the vessel was reduced from a 44- to a 36-gun ship.

Considerable activity prevailed at the yard during the remainder of the year. A brig was purchased by the citizens of some of the principal towns of Virginia, and presented to the government. It was named the "Richmond," and was fitted out under the command of Capt. Samuel Barron, who had served in the Virginia navy during the Revolution.

The vessels of Commodore Truxtun's squadron frequently resorted to the yard for repairs and supplies, and to pay off their crews.

We also find that large quantities of bread and of some other articles of provisions were furnished during the year and the next succeeding for other stations. The yard was also made a depot for the supply of masts and spars to cruising-ships, and even to vessels fitting at Baltimore and Philadelphia.

By a report submitted to Congress by the Secretary of State, March 2, 1799, it appears that commissions were issued for the district of Norfolk, between July 9, 1798, and January 1, 1799, to 10 private armed vessels, mounting in the aggregate 65 guns.

In June, 1799, a brig, called the "Augusta," was purchased and fitted out at Gosport.

July 16, 1799, Commodore Samuel Barron was ordered to duty as superintendent of the yard; Mr. Pennock, the agent, not having exercised the degree of economy which the Department desired. In the following month, however, Commodore Barron was detached and ordered to the command of the "Constellation," at New York.

The importance of the Gosport yard, particularly as an equipping, recruiting, and victualing station, had now become so well established that the Secretary of the Navy resolved to make it one of the permanent navy-yards of the country. At his suggestion the Legislature of Virginia, by an act dated January 25, 1800, ceded to the United States the property known as Gosport for the purpose of establishing a navy-yard there, such cession to take effect as soon as the value of the property should be ascertained, and the Governor be satisfied that the United States were

* Capt. Dale was afterward appointed to the "Ganges," a purchased ship armed as a 24, and which, under his command, was the first vessel of the present navy to get to sea, sailing in May, 1798.

willing to pay the amount thereof to the Commonwealth.

In accordance with the requirements of this act, Thomas Newton, Jr., was appointed on behalf of the State of Virginia, and, by an order dated 7th of April, 1800, Mr. William Pennock was appointed to act on the part of the United States to ascertain, with Mr. Newton, the value of the lands required. In a letter bearing the same date, the Secretary of the Navy enjoined the greatest economy on the part of Mr. Pennock, and informed him that the only funds available, out of which the property could be paid for, were those appropriated for the building the "74-gun ships." He also intimated to Mr. Newton that the less the amount paid for the property the more there would be available for improvements, and suggested $100 per acre as a fair valuation.

In a report to the President, dated April 25, 1800, the Secretary, in recommending the establishment of permanent navy-yards, to be the property of the United States, remarks that a large part of the expense of building the frigates arose from handling the timber, owing to the confined space in which it was piled,—enough, he thinks, to have purchased ground and to have improved it. He states that the ground at Gosport had recently been ceded to the United States on condition of the payment of its value, which he hopes will not exceed $2000.

To the surprise of the Secretary, the value assigned to the land was $12,000, or $750 per acre. In a letter addressed to Mr. Pennock on the 7th of August, he expresses the opinion that the ground should have been given to the government without charge, but that it must be taken at the valuation named, though he considered it exorbitant. He also directs Mr. Pennock to have prepared plans for improving the timber-dock, a creek making up into the yard, and which was then used as such.

January 24, 1801, $12,000 were remitted to Mr. John Hopkins, of Richmond, Va., to be paid to the State, as the purchase-money of the Gosport lands, and under date of June 15, 1801, a deed was executed by Governor Monroe, by which the title and jurisdiction of the property were conveyed to the United States. This deed is now on file in the Bureau of Yards and Docks, Navy Department.

In a report submitted to the House of Representatives, April 27, 1802, by Mr. Mitchell, from the Committee on Naval Affairs, that gentleman stated that $12,000 had been expended for purchase and $4000 for improvements at Gosport without authority of law. Under date of March 10, 1802, Mr. Mitchell, from the same committee, reported that, in the opinion of the committee, Gosport and Charlestown, Mass., from the improvements already made, and from other circumstances, were the most eligible places for receiving and repairing the ships in actual service; and that, should any additional improvements be necessary at those places, they ought to be made. He also recommended the appointment of suitable persons to make plans for improving those yards, and the appropriation of $50,000 to carry the plans into effect.

The $4000 above referred to as having been expended in improvements at Gosport had been used to build a spar-shed, timber-shed, a bridge across a small creek, which separated the yard from the rest of Gosport at that time (outside of where the present north wall stands), and probably in part for wooden wharves along the water front, and a fence around the property.

We find mention of vessels laying up, repairing, and fitting out at this yard in 1800, 1801, and 1802. In 1801, a squadron under Commodore Dale fitted out. On the 27th of July, 1801, orders were sent to *heave down* the Chesapeake for repairs.

In October, 1801, a marine-guard was sent to Gosport Yard, and the navy-agent was directed to furnish it with quarters. It is probable that the wooden barrack-building which stood on about the same site that the brick barracks were afterwards built upon was erected for the purpose.

In April, 1802, Mr. Pennock recommended the building of a store-house for provisions, etc., within the yard. Up to that time private warehouses had been hired for the use of the navy stores.

April 26, 1802, Mr. Pennock was removed, and Daniel Bedinger was appointed navy-agent and superintendent of the navy-yard.

In April, 1803, $10,000 were sent to Mr. Bedinger to build a warehouse and a timber-shed at Gosport. We find by the correspondence of a little later date that, instead of expending the money for the purpose authorized, Mr. Bedinger built with it, first, a brick wall, beginning a short distance from the water-side, running along the north front of the yard, and down the west side to the creek which formed the southern boundary, and part of which forms the present timber-basin; secondly, a brick dwelling-house for himself within the yard, and which was afterward for many years used as the commandant's house, and, with what money was left, a very indifferent shed for timber, and a warehouse, which afterward had to be taken down to prevent its falling.

August 6, 1804, an order was sent to Mr. Bedinger detaching the marine-guard from the navy-yard and ordering it to Washington.

In May, 1805, Bedinger was ordered to repair the wharves, which had been represented by a citizen as being much out of order. We find, under date of February 6, 1806, a report from Mr. Thomas Turner, accountant of the navy, in which that gentleman states that $42,748.78 had been expended in improvements and repairs at this yard, and yet, except the wall, scarcely anything of permanent value seems to have been done. The wharves were, and continued to be for many years later, of wood, and, of course, in waters infested with the *Teredo navalis*, were constantly requiring extensive repairs, and often complete renewal. During the summer of 1806 we find several gunboats and ketches fitting out and laying up, under the direction of Lieut. Arthur Sinclair.

On the 28th of November, 1806, Capt. Stephen Decatur was ordered to superintend the building of 4 gunboats at Norfolk. He seems to have superseded Lieut. Sinclair in his duties also, although that officer continued on duty under him. In July, 1807, Mr. Bedinger was ordered to contract for materials for 10 additional gunboats, and, a little later, to contract for building the same. Capt. Decatur was ordered to super-

intend the construction. We now find Capt. Decatur addressed by the Department as "Commanding naval forces at Norfolk," and he appears to have continued in this command until November, 1811; his force consisted of the frigate "United States," which he himself commanded, and of such gunboats and other vessels as were from time to time put into commission. He appears, however, to have had no immediate charge of the navy-yard, which continued under the control of the navy-agent.

In November, 1807, a marine-guard was again ordered to the yard. February 10, 1808, Bedinger's appointment was revoked, and Theodore Armistead appointed in his place as navy-agent and superintendent of the navy-yard. We now find complaints lodged against Bedinger for having used the public wharves and property in repairing his own vessels, though whether these charges were substantiated does not appear.

The agents up to this time seem not to have been required to give bonds, and, in fact, to have been held very little responsible for their acts, the Department having no military control over them.

In March, 1808, Mr. Armistead was authorized to contract for 50 tons of native hemp, and to have it made into cordage for the navy. The work was done by private manufacturers, however, and not at the yard.

In April of the same year authority was sent to Mr. Armistead to build a new timber-shed and a warehouse.

In May, 1809, an order was sent to build a powder-magazine in the yard. This stood near the creek, now timber-basin.

In June, 1810, on account of the uncertain relations with Great Britain, a small cruising squadron was ordered to Norfolk under the command of Commodore Decatur.

July 7 of the same year the Department, having become tired of the practice of operating the navy-yard under irresponsible civil administration, ordered Commodore Samuel Barron as commandant of the yard, the gunboats, the officers, and men. The navy-agent was, however, still continued as purchasing and disbursing agent, and, as such, in charge of "all stores other than military." The following letter, addressed to Commodore Barron by the Secretary of the Navy, is of some interest as being the first instructions to the commandant:

"NAVY DEPARTMENT, September 29, 1810.

"SIR,—In defining your duties and your authority in the yard at Gosport, it will be sufficient for me to state that all the military stores of every description will be under your care; that the direction of all improvements in the yard and of all reparations to our vessels at the yard are committed to you; and that within the yard you are to have the entire, undivided command.

"The navy-agent, as heretofore, will have the charge of all stores other than military, and he must have a warehouse at the yard for their safe-keeping, with perfect liberty of ingress and egress.

"PAUL HAMILTON."

The house which has been mentioned as having been built by Mr. Bedinger was assigned to Commodore Barron as a residence. It was at the time occupied by the storekeeper or clerk of the yard, an eccentric person of the name of Thomas Dulton, an ex-shipmaster. Although the navy-agent was nominally superintendent of the yard, Capt. Dulton had been in immediate charge of it for some years, performing all sorts of offices therein, ringing the bell and mustering the workmen himself. Many singular anecdotes of him are preserved among the traditions of the yard.

Commodore Barron had scarcely entered upon his command when, on the 29th of October, 1810, he was overtaken by death. Lieut. Robert Henley, under date of November 10, was ordered to assume temporary command of the yard until a relief should be ordered.

In May, 1811, Capt. Samuel Evans was ordered as commandant, and from that time we find lieutenants, masters, medical officers, boatswains, and gunners attached to the yard and to the vessels in ordinary.

Capt. Evans continued in command until August 10, 1812, when Capt. John Cassin was ordered to relieve him. Capt. Cassin had, as lieutenant and master-commandant, been for several years attached to the navy-yard at Washington, part of the time as superintendent and part of the time second in command. The Department seems to have regarded him as a valuable dock-yard officer, and the pay and allowances of a captain commanding a separate squadron were given him in his new position, although he was almost the junior captain on the list when ordered to the command.

In August, as above stated, Capt. Evans was relieved by Capt. Cassin. Very little of interest occurred during the remainder of the year. In October a blacksmith's shop was erected. By the letters of Capt. Cassin we find that considerable quantities of timber, lumber, and other stores, and of munitions of war, were furnished from time to time from the navy-yard to the army in the vicinity, particularly to the engineer officers, who were erecting fortifications. During the summer, Capt. Cassin's little force was increased by an armed yacht under Lieut. E. P. Kennedy.

Early in February, 1813, Capt. Charles Stewart, in the "Constellation," which had fitted out at Washington, in attempting to get to sea, was met by a large force of British ships which were seen entering the Chesapeake as he came abreast the Horseshoe. It being calm when he discovered the enemy, Capt. Stewart kedged the "Constellation" from the Horseshoe to a position in the Elizabeth River, just opposite Fort Norfolk, now the navy magazine.

Capt. Stewart now became commanding officer of the station in general by virtue of his seniority, though Capt. Cassin continued to command the gunboat flotilla, and made his reports directly to the Department. The most untiring vigilance, activity, and skill were now required to defend the frigate and flotilla from capture, and at the same time to annoy the enemy as much as possible. Both objects were successfully accomplished.

On the 30th of November, 1813, Mr. Jones, the Secretary of the Navy, in answer to a resolution of the House of Representatives calling for information on the subject of navy-yards, submitted, among other papers, the following

letter of Capt. Cassin, giving a description of the yard at the date of the report:

"NAVY-YARD, GOSPORT, May 25, 1813.

"SIR,—I have the honor to inclose you a statement of the accommodations provided in this yard, with the number of officers and men attached. . . . The commander's dwelling of brick, two stories high, made comfortable quarters; marine barracks, miserable huts of wood, wanting much repair; the officers' quarters are low two-story frame buildings, the whole 150 feet from the west wall, which is only 5½ feet high; the northwest is bounded by warehouses and timber-sheds, having to extend a fence on the east end to low-water mark.

"The marine hospital stands in the centre of the yard, two stories high, was formerly occupied as boatswain's and gunner's store-rooms, built of wood, the centre of which is occupied as the hospital, the garret as rigging-loft, and lower part gunner's store, store-keeper's office, purser's issuing-room and office.

"The blacksmith's shops, begun of brick, 165 feet by 50, including anchor and plumber's shops, not completed, the old shops being dangerous to heat a large fire.

"One large timber-shed, 300 feet long, with brick pillars, and 50 feet wide.

"One small shed for the armorer and plumber; two sheds appropriated, one for the joiners, the other for mast-makers.

"JOHN CASSIN."

In April, 1815, an order was sent to Capt. Cassin by the Secretary of the Navy to raise the hulks which had been sunk in the channel during the war, and which constituted a serious obstruction to the narrow channel.

During the summer of 1816, under an order dated the 7th of May of that year, an examination was made by the Board of Navy Commissioners, then consisting of three of the most distinguished officers in the navy, viz., Commodores John Rodgers, Stephen Decatur, and David Porter, to ascertain the best manner of defending the Chesapeake Bay, and also to determine the most advantageous site for a naval station and depot within its waters.

Differing somewhat in their opinions, especially as to the best location for a naval station, each officer made a separate report. Commodore Rodgers favored a position in York River, 10 miles above York, called the Clay Banks; Commodore Porter, the mouth of the St. Mary's River; and Commodore Decatur, the site already occupied at Gosport.

No action seems to have been taken upon the reports of the board, and no material changes occurred for the next few years.

In the summer of 1817 the keel of a line-of-battle ship was laid. The timber for this ship had been in store for years, having been collected under the provisions of the act of Congress of February 25, 1799, and subsequent amendments. The name afterward chosen for this ship was "Delaware." We find authority given during the same summer to build a saw-shed and a steam-stove.

In January, 1818, authority was sent to Capt. Cassin to remove or pull down the old hospital which was situated within the yard. A small frame building, located near the present dry-dock, was afterward used for some years as a hospital.

In June, 1818, the ship "Alert" was assigned as receiving-ship at Norfolk, Commander Jesse Wilkinson being ordered to command her.

In September, 1818, Capt. Arthur Sinclair was ordered to this navy-yard to superintend the construction of the "Delaware" under Capt. Cassin. Capt. Sinclair is soon after addressed as "Commanding Naval Officer Afloat" at Norfolk, and held a command separate from the yard for several years later. The receiving-ship was a part of his command, and all recruiting was done under his direction. We find about this period, and for some years after, considerable quantities of timber, plank, knees, masts, and mast-pieces, and also of cordage furnished from Gosport to the navy-yards in other parts of the country.

In the latter part of 1818, the old wooden buildings used as marine barracks were pulled down and a brick building put up in their place. The line-of-battle ship "New York" was also commenced in this year.

In October, 1820, the "Delaware" was launched and housed over, not being required for service immediately.

In June, 1821, Capt. Cassin was relieved by Capt. Lewis Warrington. During the summer of that year Capt. Warrington was directed to fill in the old timber-basin. This was a shallow basin, originally formed by a creek or cove, and included the spot where ship-house B was afterward built; its banks were protected by wharf-logs, with a wharf across the entrance provided with slips for boats to enter. A ship-house was authorized to be built over the "New York"; this was afterward lettered A. A pair of masting-shears was also authorized.

In August, 1821, a school for midshipmen was established under the charge of Chaplain David P. Adams, on board the "Guerriere," frigate, then in ordinary at Norfolk.

Improvements to the navy-yard buildings, repairs to the wharves, filling in and leveling the grounds, were carried on from year to year under the current appropriations.

In December, 1824, Capt. Warrington was relieved from the command of the yard by Master-Commandant James Renshaw.

On the 25th of May, 1825, Commodore James Barron relieved Capt. Renshaw as commandant of the yard.

On the 28th of November, Commodore Barron, in answer to a complaint of the Secretary of the Navy that too long a time was required to repair and fit out ships, informed the Secretary that the delays were immediately owing to want of proper workshops, store-houses, and a dock, and proposed a plan for the improvement of the yard, which involved the purchase of more land (the yard being altogether too confined for the purpose for which it was required), the erection of suitable buildings and shops, and of a floating dry-dock. He furnished a plan and estimates for the last. He especially urged the inexpediency of erecting wooden wharves and docks in waters infested with the *Teredo navalis*, which destroyed the structures at the water's edge, and left the substructure to form actual obstructions in the channel.

The question of purchasing additional ground seems thus to have been re-opened, and under

date of February 26, 1826, Mr. King, the navy-agent, suggests to the Navy Department the plan of applying to the county court to appoint a jury to appraise the lands required by the government. This suggestion was approved by the Secretary, but seems to have been a very slow process.

On the 22d of May, 1826, a resolution of Congress of the following purport was approved, viz.:

The President to cause an examination and accurate survey to be made by skillful engineers of a site for a dry-dock at the navy-yards at Portsmouth, N. H., Charlestown, Mass., Brooklyn, N. Y., and Gosport, Va., respectively; and that such engineers be required to state the dimensions necessary for such docks, the advantages of each of the above-named establishments, and the objections that apply to either, with a detailed estimate of the expense of a suitable site, and of constructing a dock at each of said places; and the President be requested to communicate the same to Congress in the first week of the next session.

On the 26th of July, Col. Baldwin (the civil engineer before mentioned) was appointed by the Department to make the required surveys. The first spot selected at Gosport as the site of the dock was at the northern side of the entrance of the creek, now forming a timber-dock; this site was chosen as being the best in the yard as it then existed.

During the same year (1826) the frigate "St. Lawrence" was laid down, and a ship-house built, afterward lettered B.

On the 3d of March, 1827, Congress passed an act entitled "An act for the gradual improvement of the navy of the United States," by which there was appropriated the sum of $500,000 per annum for six years, to be applied to the purposes specified in the act.

By section 4 of the act, the President was authorized to cause to be constructed two dry-docks on the most approved plan, for the use of the navy of the United States; one of the said docks to be erected at some point to the south, and the other to the north, of the Potomac River.

By section 6, the President was authorized to cause the navy-yards of the United States to be thoroughly examined, and plans to be prepared for the improvement of the same and the preservation of the public property therein; from which plans, after they should be sanctioned by the President, no deviation should be made but by his special order.

On the 29th of March, 1827, Mr. King, the navy-agent, reported that the lands from Jefferson Street, along the line of Third Street to the county road, and thence down to the water, could be purchased for $7825. He was authorized to make the purchase, and also of such other lands adjoining the yard on the south as should be deemed necessary, and was directed to consult with Commodores Bainbridge, Morris, and Chauncey, who then constituted the board charged, under authority of the act above alluded to, with the examination of the yards and the formation of plans for their improvement.

The Board of Commissioners, of which Commodore Bainbridge was president, during the winter of 1827–28 made an elaborate plan for the improvement of the yard, based on a thorough survey of the yard and the adjacent waters by Col. Baldwin.

On the 17th of June, 1833, the anniversary of the battle of Bunker Hill, the dock was opened for the reception of the line-of-battle ship "Delaware," the first liner built at Gosport, and the first national ship ever docked in a dry-dock belonging to the United States.

The line-of-battle ship "North Carolina" was soon afterward admitted to the dock.

Commodore Warrington, who had assumed command of the yard May 26, 1831, continued in it until the 7th of October, 1840. The yard was constantly used in the mean time for fitting out, refitting, repairing, and laying up the ships and vessels of the navy.

The sloop "John Adams" was built in 1830. The frigate "Macedonian" was rebuilt here between the years 1832 and 1836. The surveying-brig "Pioneer" was launched in 1836. The line-of-battle ship "Pennsylvania" became the receiving-ship in 1837. The sloop "Yorktown" was commenced in 1835 and launched in 1839.

Of the old buildings that were standing in 1837, the ship-houses, the office-buildings along the north wall, the commandant's house, and a portion of the marine barracks, were still standing in 1840; the rest had all been removed or rebuilt.

Commodore W. B. Shubrick assumed command of the yard in October, 1840, and retained it until October, 1843. A plan of the yard, made under his direction by Capt. Sanger and received at the Bureau of Yards and Docks in November, 1842, shows little progress up to that date beyond what is mentioned above,—the continued appropriation for "gradual improvements" having ceased. A blacksmith's shop and turning-machine and a foundry and plumbery had been added to the steam-engine house, and some other store-houses had been begun.

The steamer "Union" was laid down at the yard in 1841 and launched in 1842. The store-ship "Southampton" was commenced in 1842.

In October, 1843, Commodore Shubrick was relieved by Commodore Jesse Wilkinson as commandant.

In 1842 an appropriation was made by Congress for a dredging-machine for this yard, which was completed the following year, and successfully used for deepening the channel in front of the dry-dock and along the wharves; the earth brought up was used for filling up where needed in the yard. During the year 1843 the ground around the dry-dock was graded and the pavement relaid; by this the dock was protected from injury to which it had been subject from filtration.

The brig "Perry" was laid down in 1843, and some additional machinery was erected in different shops during the same year. The quay-wall was completed during that and the following years, *i.e.*, 1843–44, as far as ship-house B.

The sloop "Jamestown" was laid down in 1843 and launched in 1844. In 1845 another store-house, No. 16, was built. A bridge across the timber-dock was completed. The dock itself was still in an unfinished state, no appropriation having been made for several years. Work was suspended on the quay-wall in 1845 for the same reason. A new building-slip was commenced in 1845 under special appropriation. The

store-ship "Southampton" was launched the same year.

On the 26th of August, 1846, the lot of ground opposite the navy-yard, on the Norfolk side of the Elizabeth, and known as Saint Helena, was purchased and added to the yard. This ground was needed for ordnance purposes. Jurisdiction over it was ceded to the United States by an act of the General Assembly of Virginia, dated March 22, 1847.

Commodore Lawrence Kearny became commandant on the 1st of June, 1847. Some progress was made that year upon the launching-slip previously spoken of. Another store-house, No. 13, commenced the year before, was finished. The frigate "St. Lawrence" and the brig "Perry" were launched. The former had been on the stocks for over twenty years. The steam-frigate "Powhatan" was laid down.

January 19, 1848, Commodore John D. Sloat was ordered to relieve Commodore Kearny as commandant.

In 1848 a small appropriation was made by Congress for continuing the quay-wall, and was applied to build a coffer-dam for the north wall of the timber-dock. Appropriations were also made for a new pair of masting-shears, for additional machinery, for various shops, and for improvements at Helena.

In September, 1849, Fort Norfolk and the grounds about it were turned over to the navy by the War Department for the establishment of a magazine for powder and shells. Work was immediately commenced upon the shell-house. A building near the site of the present saw-mill, outside of the yard, when built, had been used as a magazine for some years previously. During the same year, building No. 51 was erected, also some brick stables. An engine-house to the smithery was commenced. A gun-park, a coal-house, and a landing-wharf were built at Saint Helena. Work upon the quay-wall progressed as far as the appropriation would permit.

Between the years 1850 and 1860 great progress was made in improving the yard, under current appropriations, while at the same time great activity prevailed in building, repairing, fitting out, and laying up the ships and vessels of the navy. The steam-frigate "Powhatan" was launched in 1850. Work upon the quay-wall was steadily continued from year to year. The timber-dock was finished in 1854, together with the bridges across it. A culvert was built in 1853 to drain the lands adjoining the yard and to conduct the water from them into the dock, thereby considerably freshening that in the dock. The culvert was built of brick laid upon a pine-plank floor.

There being but a limited supply of fresh water at Gosport, appropriations were made in 1850 for building cisterns for collecting rain-water; one was completed in 1851, with a capacity of 38,000 gallons. Afterward two large reservoirs were built,—one completed in 1856, holding 124,000 gallons, with a head, when full, 14½ feet above the grade of the yard. The other reservoir was completed in 1857; its capacity is 128,000 gallons.

Work upon the magazine and the keeper's house at Fort Norfolk was commenced in 1851, but not completed until 1856. A reservoir was built near the magazine to contain 90,000 gallons of water. A sea-wall and landing-wharf were also built, and two old houses converted,—one into a store-house and the other into a filling-house.

Building No. 19, a rigging-loft, armory, and offices, and the entrance-gateway, was erected in 1851–52. A building was constructed in 1853 near timber-shed No. 33, which was designed for a saw-mill and burnetizing-house. It was entirely devoted to the latter purpose, however, and in 1856 a saw-mill was erected at the south end of the yard, on one of the sites intended for a dry-dock. A culvert was constructed in 1855 from the burnetizing-house to the timber-dock.

Dredging was carried on from year to year during the decade, deepening the channel and furnishing material for filling in the low places of the yard, and the space between the old shore-line and the quay-wall as well as at Saint Helena. A new dredging-machine was built in 1854.

Grading the yard was also attended to; pavements were laid around the buildings, and brick foot-walks through the yard in various directions; roads were macadamized, and a thorough system of drainage established, by which the sanitary condition of the yard was much improved.

Gas for lighting the yard and buildings was introduced in 1855.

On the removal of the saw-mill in 1855 and 1856, new machinery was added to the machine-shop, and a new foundry was erected, completed in 1859, on site 41, designed in the "approved plan" for an iron and copper store. A boiler-shop was commenced to the northward of the machine-shop. A new engine for pumping out the dry-dock was completed and set up in 1856. A large and commodious building was erected in 1856 as a receiving and issuing store for the department of provisions and clothing. It was located on the new-made ground, just south of the entrance of the timber-dock, into which a culvert from its cellars leads. An ordnance building, not on the "approved plan," was commenced in 1858 and completed in 1859. Gun and shot platforms were built at Saint Helena, and also at the yard south of the ship-house A.

Two large lifting-cranes were erected on the quay-wall in 1857, and a large amount of machinery of various sorts was added to the different shops through the yard. Alterations, additions, and improvements were made to some of the buildings under the appropriation for "repairs of all kinds." Rail-tracks were laid down at Saint Helena, and also at the yard; in the latter connecting the anchor-racks near the dry-dock, the different shops and store-houses, with the wharf near the shears.

Considerable building, repairs, etc., of ships was carried on during the same period. In 1855 the magnificent steam-frigates "Roanoke" and "Colorado" were laid down; these vessels were finished and launched in 1857. The steam-sloops "Dakota" and "Richmond" were begun in 1858 and launched, the former in 1859, and the latter in 1860. A purchased steamer called the "Dispatch" was rebuilt in 1859 under the name of "Pocahontas."

The following were the commandants of the yard during this period, viz.: Capt. Silas H. Stringham (late rear-admiral), from 17th Feb-

ruary, 1851, to 1st April, 1852; Capt. Samuel L. Breeze, from 1st April, 1852, to 10th May, 1855; Commodore Isaac McKeever, from 10th May, 1855, until his death, which occurred on the 1st of April, 1856; Capt. Thomas A. Dornin (late commodore), from 6th May, 1856, to 30th April, 1859; Capt. Charles H. Bell (late rear-admiral), from 30th April, 1859, to 1st August, 1860, when he was relieved by Commodore Charles S. McCauley.

On the 1st of April, 1861, there were, at the yard or in the stream, the following ships and vessels of war, viz.:

Ship-of-the-line "Pennsylvania," 120 guns, receiving-ship.

"Ship-of-the-line "Columbus," 74 guns, in ordinary.

Ship-of-the-line "Delaware," 74 guns, in ordinary.

Ship-of-the-line "New York," 74 guns, on the stocks.

Steam-frigate "Merrimac," 40 guns, under repairs.

Frigate "United States," 50 guns, in ordinary.

Frigate "Columbia," 50 guns, in ordinary.

Frigate "Raritan," 50 guns, in ordinary.

Sloop "Plymouth," 22 guns, ready for sea.

Sloop "Germantown," 22 guns, ready for sea.

Brig "Dolphin," 4 guns, ready for sea.

In addition to these, the frigate "Cumberland," 24, the flag-ship of Flag-Officer Pendergrast, commanding the Home Squadron, was also lying off the yard, fully manned.

The evacuation of the yard; the destruction of the government property; the scuttling of the "Germantown," "Plymouth," "Dolphin," and "Merrimac"; the occupation of the yard by the rebels; the raising and rebuilding of the "Merrimac" as an ironclad under the name of "Virginia," though to the public always known by her old name; the destruction by her of the frigates "Congress" and "Cumberland"; the opportune arrival of the "Monitor" under Lieut. Worden (now rear-admiral), by which the "Merrimac" was driven back to Norfolk, and afterward held for months blockaded in the Elizabeth; and the capture of Norfolk by the U. S. forces under the immediate direction of President Lincoln in May, 1862, are all well-known matters of history.

The vessels of Admiral Goldsborough's squadron participated in the attack on Norfolk by shelling the batteries at Sewell's Point. The ironclads "Monitor" and "Stevens," with some wooden steamers to act as rams, endeavored to draw out the "Merrimac," but without success, she declining to engage.

The city of Norfolk was surrendered by the civil authorities to Gen. Wool on the 10th of May, 1862. Early on the following morning the "Merrimac" was blown up by her own people to avoid capture by Admiral Goldsborough's squadron. The navy-yard was fired and abandoned at the same time.

Admiral Goldsborough immediately moved his flag-ship to Norfolk, anchoring off the naval hospital. By his order, sanctioned by the President, the forts along the shores of the Elizabeth, and as far down as Sewell's Point, and also those for some distance up the Nansemond, which had been erected by the rebels, were dismantled and blown up. Lieut. Selfridge was charged with the work of destroying the former, and Lieut. John Watters the latter.

Admiral Goldsborough took possession of all the naval property in the vicinity, including the yard, the magazine, and the naval hospital. By his order a careful examination of the yard was made by Lieut. Selfridge, who, under date of May 19, reported substantially as follows:

The only buildings uninjured by fire were 5 brick dwellings, the boiler-shop, the foundry, and one wooden timber-shed. He found and collected about the yard a quantity of chain-cables, sheet- and bolt-copper, 15 old ships' galleys, smiths' tools, and detached pieces of machinery belonging to the smithery, a quantity of cordage, a diving-bell, a large quantity of oak-timber, some pine planks, and 50 pieces of spar-timber, 150 barrels of pitch, fourteen 32-pounder guns, two 100-pounder rifles, 140 old guns, worthless, and three 32-pounder gun-carriages, a number of water-tanks, great quantities of old iron and of pig-ballast, a number of iron plates punched for bolting, 30 anchors, and a number of kedges. He found some of the machinery in the machine-shop in good condition and some injured.

On the 20th of May, 1862, Capt. John W. Livingston was ordered to the yard as commandant. He at once commenced the work of putting the yard in as good order as its ruined state would permit, and of gathering up the public property, a large quantity of which was found outside in various places. Many articles were restored by the citizens, or pointed out so that they could be taken possession of. A considerable quantity of timber, 3 fire-engines, and a number of guns were among the things so restored. Two diving-bells, anchors, shot, shell in boxes, and many other articles were recovered from the water, having been thrown overboard from the quay and the wharves.

Repairs were commenced as soon as possible, particularly upon those shops which were most immediately needed. The machine-shop was put in working order in a very short time. An appropriation was made to restore the dry-dock, which the rebels had temporarily disabled by destroying the gates. New gates were constructed and the dock put in working order during that year.

Considerable appropriations for the fiscal years ending July, 1865, 1866, 1867, respectively, were made by Congress for restoring the various workshops, stores, wharves, shears, cranes, and machinery in the yard. The objects most needed to make the yard a repairing and refitting station were first attended to, in order that the immediate requirements of the service might be met.

The arrangement of store-houses was systematized, in which, by the way, this yard set the example to most of the others in the country; separate buildings or parts of buildings were assigned to the different departments, whose heads were made responsible each for his own stores. By this means the public property was much better cared for and preserved than under the old system, the accountability made much more perfect, and the facility for handling and issuing stores vastly increased.

The restoration of the yard has been steadily progressing under the current appropriations, which, however, have been very small since

1867, and only under the head of "repairs of all kinds."

The following is a list of the buildings which have been repaired or rebuilt, though in some instances the purposes to which the buildings are devoted have been changed from those originally designed; the new arrangement is here given, viz.:

No. 9. Smithery, etc.

No. 11. Construction store-house.

No. 13. Equipment-store.

No. 14. Provisions and clothing-store. This building was substituted in 1870 for the victualing-house, which had been rebuilt on the new-made ground just south of the entrance to the timber-dock, but which commenced to settle and became in danger of falling; to prevent which the building was taken down.

No. 15. Steam-engineering store-house.

No. 16. Ordnance building.

No. 17. Yards and docks store-house.

No. 18. Ship-carpenters' shop, just north of the dry-dock.

No. 19 (one of the entrance-buildings, so called). Contains offices, drafting-rooms, court-martial-room, cordage-store, navigation-store, and marine guard-room.

No. 57 (the other entrance-building). Rigging-loft and sail-loft.

Nos. 20 to 25, both inclusive, as marked on the plan, have never been built upon, and some of the numbers have been re-assigned, viz.:

No. 21. Saw-mill, in the south part of the yard.

No. 22. Foundry.

No. 23. Boiler-shop.

No. 28. Mast-house and house-joiners' shop.

No. 29. Boat-builders' shop, boat-house, block-makers' and ship-joiners' shops.

No. 30. Timber-shed and furniture store-room for the construction department.

No. 31. Timber-shed, paint-shop, and sail store-rooms.

Nos. 36, 37, and 38. Machine-shop. These constitute one building, and have recently been so extended as to join them with the foundry.

No. 37. This number is now given to a small building on part of the foundation of the former ordnance-building, just south of No. 9; it is used as a plumbers' shop.

The officers' quarters are now lettered, viz.: A, commandant's; B, executive-officer's; C, surgeon's house; and the two houses on the site marked 39 are lettered D and E.

No. 39. This number is now used to designate a new building, which has been constructed as a workshop for the department of yards and docks. It is built of the materials of the victualing-house, which was taken down in 1870, and is located south of No. 12. In excavating for the foundations of this building, a number of human remains were found, to account for which several theories were advanced. By consulting a very old plan of the yard, which is without date, but which was made about the year 1816, it is found that a burying-place existed on that spot at that time; it was near the bank of the stream or creek, a part of which now forms the timber-basin. The remains are, therefore, no doubt, those of U. S. sailors and marines.

In addition to the buildings above mentioned, there are in the yard stables, sheds, tar-, pitch-, lime-, and oil-houses, watch-houses, offices, etc., in various parts of the yard. The car-tracks have been restored, wharves repaired, new shears and a large lifting-crane have been erected. The reservoirs for rain-water, with their system of pipes leading to various parts of the yard, are in good condition.

A contract was entered into by the government with companies of wreckers, by which, on terms advantageous to the government, nearly all of the hulks of the vessels destroyed at the yard, as well as of the "Merrimac," have been raised and broken up, thus clearing the channel.

Dredging has been carried on from time to time, and is going on now, for deepening the channel off the yard, the design being to gain 24 feet of water at least. The earth removed is used for filling in where needed in the yard.

The following have been the commandants of the yard since its repossession by the United States, viz.:

Capt. John W. Livingston, from May 20, 1862, to November 16, 1864; Capt. John M. Berrien, from November 16, 1864, to October 7, 1865; Commodore Robert B. Hitchcock, from October 31, 1865, to August 7, 1866; Rear-Admiral S. C. Rowan, from August 7, 1866, to July 23, 1867; Commodore A. H. Kilty, from August 15, 1867, to October 1, 1870; Rear-Admiral C. H. Davis, from October 1, 1870, to July 1, 1873; Commodore Thomas H. Stevens, from July 1, 1873, to 1876; Commodore J. B. Creighton, 1876–79; Commodore A. K. Hughes, 1879 to present time. —*Edward P. Luce, Captain U.S.N.*

Navy-yard, Pensacola, Fla. The navy-yard built on Tartar Point, Pensacola Bay, was located about the year 1825, and operations were begun in October, 1826, by a party of mechanics from Boston, under charge of Lieut. Cunningham, of the navy.

In 1836 its importance had become so far recognized that Commodores Charles Stewart, A. J. Dallas, and William C. Bolton were appointed commissioners to make thorough examination and report upon a full and complete plan for the development of the yard as a first-class station. Congress made liberal appropriations from year to year, until at the beginning of the civil war it had become one of the best-equipped stations in the country,—having a floating dry-dock and all appliances for the docking, repairing, and building of our ships-of-war. The sloops "Seminole" and "Pensacola" had been built, and timber had been stored for other vessels, when the war of the Rebellion came on, and the yard was betrayed into the hands of the rebels through the treachery of Commander E. Farrand and Lieut. Frank T. Renshaw, both men of Northern birth, education, and citizenship, but who had married in the South. The insurgents held the yard until the autumn of 1862, when the momentous struggle before Richmond compelled the rebel government to concentrate its forces, and the yard was evacuated, together with other points on the Gulf and Atlantic coasts. Before the evacuation, however, the yard was gutted of all stores and material, and the buildings were mostly destroyed, including the beautiful and commodious naval hospital, located a mile distant from the yard. To insure the more complete destruction of the fine row of officers' quarters, loaded

shells were placed in every fire-place when the buildings were fired.

Upon the reoccupation Admiral Farragut fitted up a temporary machine-shop, and during the rest of the war the yard was of great service as a depot of repair and supplies for the Gulf Squadron.

Since the war the yard has been gradually improved and rebuilt,—a sectional floating dry-dock of iron is nearly completed, and at the last session of Congress $150,000 was appropriated to put the yard in a more perfect state of efficiency.

Situated on the Gulf, the place is generally healthy, but the dreaded visitations of yellow fever render the station unpopular with the service, and few officers care to go there, unless citizens of the South and accustomed to its climate.

The first commandant was Commodore Lewis Warrington, for whom the principal village in the naval reserve, comprising some 1600 acres, was named. Some of his successors were Commodores Woolsey (father and son), Chauncey, Dallas, Latimer, Tattnall, Rousseau, Stribbling, Newton, McIntosh, James Armstrong, Smith, Green, Middleton, and Cooper, Capt. Belknap, and Commanders J. F. Armstrong and J. F. McGlensey.—*G. E. Belknap, Captain U.S.N.*

Navy-yard, Portsmouth, N. H.—Among the state papers of New Hampshire relating to naval affairs, we find recorded the following:

No. 21.

6th Congress, 2d Session. } Naval Establishment and its expenses.
Naval Department, Jan'y 12th, 1801.

Ground purchased in Portsmouth for a Navy-Yard.

Harrison Grey Otis,
Chairman of Committee on Naval Affairs.

October 1st, 1800, Portsmouth, N. H.	For purchase of Land	$5,500
	Improvements	26,304
Fifty-Eight Acres.		$31,804

As soon as the government took possession of the island work commenced at once in repairing a building for the use of the superintendent of the yard, removing the material from the adjoining island, building a shed for timber, and a wet-dock for seasoning the same.

In 1803 a house was erected for a dwelling, barracks for marines, and a bell-tower built. An octagon fort, of earth and heavy timber, with embrasures for eight heavy guns, also platforms for the same, was built upon the hill, and a flag-staff erected.

Nothing more was done on the yard, except to collect timber for building purposes, until 1806, when a first lieutenant of marines, Mr. J. M. Gamble, with 1 sergeant, 2 corporals, 15 privates, and 2 musicians were ordered by the Navy Department to this station as a garrison to protect government property on the island. A small gun-boat, called the "Bee," was ordered for the protection of the harbor, and to act as guard-ship. No work other than the clearing of the island and erection of sheds, smith-shop, saw-pits, and the building of a few small boats for the use of the yard, was done until the year 1812, when the government changed its former policy respecting navy-yards, and placed them under the command of a naval officer as commandant.

On the 4th of October, Capt. Isaac Hull took command of the navy-yard as commandant. Sailing-Master Nathaniel Stoodley was ordered to the command of the gunboats at the yard.

In March, 1814, the keel of the 74-gun ship "Washington" was laid, two sheds having been removed to make room for the ways. Work progressed upon this ship very rapidly; by the following September she was well advanced, and a house built over her (now ship-house No. 5); she was not launched until January of the year following. During the year that the "Washington" was building, much anxiety was felt lest the enemy should send a party by night, in boats, and burn her, and precautions were taken to prevent it. The "Washington" was launched in July, 1815, peace with England having been declared the February previous.

The launching of so large a ship as a 74 was an event of uncommon occurrence in this vicinity, and thousands of persons were attracted hither by it. On the day of the launch the weather was fine, and the shores lined with an enthusiastic multitude; as the great mass began to move slowly out of the ship-house the cheers were deafening; the band played a national air, while the roar of the cannon from the surrounding forts added to the din.

On the 1st of July, 1815, Capt. Hull was relieved from command of the yard by Capt. Thomas McDonough. From 1815 to 1818 there was no work done on vessels at the yard, the entire force being employed in laying out walks and making preparations to erect buildings. Quite a number of negro seamen were employed at the yard in the ordinary force, but orders from the Department caused their discharge, and none were allowed to be employed excepting as servants to officers.

In February, 1817, orders were received to lengthen the ship-house (now No. 5) 12 feet, and to build a ship-of-the-line to measure 9 feet more in length than the "Washington"; accordingly, on the 15th of April the keel of the "Alabama," 74, was laid in the lengthened ship-house.

In July, 1818, Commodore McDonough was relieved as commandant by Capt. Charles Morris. The first portion of wall at this yard was laid west of the ship-house, in March, 1819, and the earth filled in the wall was extended some 500 or 600 feet to the west. The force on the yard was largely increased, as a new ship-house was building to the west of the old one, and the construction of the "Alabama" was being pushed forward. In 1820 the ship-house (No. 4) was finished and the "slip" begun. Capt. E. Watson, U. S. marine corps, received permission to erect barracks for the marine-guard of the yard, using an old house, which is now on the island, in addition to the small one now occupied by them. The work was almost entirely done by the guard, and the expense of the new barracks was trifling; it stood where the gun- and shot-park now stands.

The schooner "Porpoise" was begun in September, 1820, and launched on the 26th day of November following. Her cost when ready for sea was $25,529; her tonnage, 178; battery, ten 6-pounders and one long 18-pounder. In 1821 $12,000 were appropriated for improvements on the yard. The store-house and offices was commenced this year. This building was the first brick one erected in the yard. The keel of the

"Santee," a 44-gun frigate, was laid in the new ship-house, and the present timber-dock with its sea-wall was finished this year.

In May, 1821, application was made to the State of Maine "for the cession of the jurisdiction of the island on which the navy-yard at Portsmouth is situated," and in the month following it was granted; the State reserving the right to serve processes on the yard and to arrest criminals.

Wooden buildings for officers' quarters were erected upon the site now occupied by those elegant structures of brick. In May, 1823, Capt. Wm. M. Crane relieved Capt. Morris as commandant.

The store-house had advanced so far towards completion that the officers were removed into it on the 1st of January, 1824, together with the naval stores. The cost of this building was $4000. In 1827 the addition was made to this building (which may be noticed by the roof being higher), and it is now the stores of steam engineering, equipment, navigation, and sail-loft, the cost of which was $15,000. The old wooden building which had been used for offices was removed to the rear of the marine barracks, and used as a cook-house for the marines and men of the ordinary. The stone wall from the ship-house (No. 5) to the blacksmith-shop was finished in 1824; it was 687 feet long, 10 feet high, and 2½ feet wide.

Nothing more was done to improve the yard, excepting to finish the mast- and spar-house (now No. 7) until 1826.

Capt. Crane was relieved by Capt. Charles G. Ridgeley, in March, 1825.

In the year 1825 the bridge leading to Kittery was built, and the commandant made propositions to the owners of the land adjoining the bridge to cut a road leading to the main highway of Kittery. The owners of the land objected to such a road, although the government offered to purchase their land for this purpose. Finding that nothing could be effected by negotiation, application was made to the selectmen of Kittery, with the assurance that the damages would be paid by the government. The road was then laid out by them according to the laws of the State, and became a townway. The damages were paid by the United States, and communication by road opened with Portsmouth in the summer of this year.

In 1826 activity was resumed, and much work in the way of improvement done. Orders were received to select a proper site for the building of suitable barracks on the island. All wooden buildings and sheds were demolished and removed, especially those in the vicinity of the ship-houses. The upper story of the mast-house was finished for a rigging-loft, and the blacksmith-shop enlarged by two additions being built to it. Work was being forwarded also on the 74-gun ship and the frigate in the ship-houses.

In November, 1826, Capt. J. O. Creighton relieved Capt. Ridgeley as commandant. In the spring of 1827 the foundation of four brick buildings for officers' quarters was commenced, and in the autumn following they were finished. In the summer of the same year a brick block was built for the accommodation of the warrant-officers, petty officers, and seamen. Three timber-sheds were also built, 200 feet long, 65 feet wide, and 15 feet to the eaves; the roofs were slated and supported by stone pillars 10 feet apart; they are Nos. 45, 46, and 48. The cost of these sheds was $9250 each. In March, 1827, the keel of the sloop-of-war "Concord" was laid at the little slip where the "Porpoise" was built. The leveling for the purpose of building the barracks was completed and the foundation laid; the spot selected for the barracks was the extreme northeast point of the island. In August, 1828, Capt. J. D. Henley relieved Capt. Creighton in command.

On the 24th of September, 1828, the sloop-of-war "Concord" was launched. On the 21st of November, 1828, the yard was visited by one of the most severe gales of wind ever known in the vicinity, and great damage was done to the roofs of the buildings and the timber-dock. During the years 1829–31 nothing of importance was done in improving the yard, except the building of a timber-shed at a cost of $9500, no appropriations having been made for improvements and repairs. In September, 1832, Capt. Henley was detached from the yard, and the 9th of October, Capt. W. M. Crane was again appointed commandant.

The winter of 1832–33 was one of unusual severity, and all work out-of-doors was in a great measure suspended until the month of April, when, in compliance with orders received from the Department, a brick dwelling was commenced, adjoining the quarters recently built. It was the original intention of the Department to build two dwellings in uniformity with those already built, but it was afterwards decided to build a large dwelling for one family. The building (now Quarters B) was finished in December of 1833, and cost $15,000.

In the year 1834 orders were received from the Department to build a third ship-house in the yard, and after some delay in selecting a site, the present one was chosen, and work was begun at once on the foundation and slip.

During this year many improvements were made in the yard, extensive repairs being made to the bridge leading to Kittery, which had fallen into decay during the past nine years; the timber-dock was enlarged to accommodate the amount of timber which was required yearly for building and repairing vessels. The quarters were completed and occupied by the officers, and the old building, which had been occupied by the lieutenant of the yard, was fitted up as a temporary hospital for the station.

In 1815 the ship-house had advanced so rapidly towards completion that preparations were made to build a ship in it. In 1838 this magnificent structure was entirely finished, the total cost being $71,000. The "Lexington" and "Congress" were both fitted for sea, and sailed from the yard in 1837.

The barracks of the ordinary were raised one story and made into dwellings for the warrant-officers, at a cost of $4000.

On the 14th of April, 1838, Mr. John Floyd, naval constructor of the yard, died, and he was succeeded by Mr. Samuel M. Pook, who reported in November of the same year. The new ship-house was now finished, and a small sloop was being built therein. On the 14th of June, 1839, the sloop-of-war "Preble" was

launched, having been completed in thirteen months from the laying of the keel, and when ready for sea her cost was $112,782. On the 2d of June, 1840, the sloop "Preble," Commander Breese, sailed from this station, bound for the coast of Labrador, and after making six cruises upon different stations, she was converted into a practice-ship for midshipmen, and afterwards sold.

For some time past a wharf was being built from the old ship-house to the eastward. The manner of building was by cob-work of timber filled in with stone as a foundation. On the 1st of August the entire fabric gave away, and was precipitated into the deep water.

About 100 feet of sea-wall was destroyed by this accident, and the Department at once decided that the services of a civil engineer were required at the yard to obviate any future accident of this nature; consequently, Mr. Calvin Brown was employed as engineer and draughtsman at a pay of $3 a day, and from this date the services of a civil engineer have never been dispensed with at this yard.

As soon as the "Preble" sloop-of-war had been launched from the new ship-house preparations were made to immediately build a frigate of the largest class, and in August, 1839, the keel of the "Congress" was laid, and on the 16th of August, 1841, she was launched.

The old "Congress" was launched from the adjoining island at noon, August 15, 1799. She was 190 feet long on the spar-deck, 50 feet beam, and 1700 tons burden. The cost of the old "Congress" was $197,246, and that of the new $399,088, over twice the cost of the former. Capt. Crane was relieved from the command of the yard in October, 1840, by Capt. John D. Sloat.

The former practice of masting vessels by erecting sheers on board being tedious and expensive, Capt. Sloat received permission to build a pair of permanent sheers, which he did, using the lower masts of the "Alabama," 74, for that purpose; when erected they cost $2240. The masts of the "Congress" frigate were the first put in with the new sheers.

A diving-bell was purchased for the use of the yard, and work immediately began by removing the *débris* of the fallen sea-wall, under the superintendence of the civil engineer of the yard.

Orders were received to build a first-class sloop at the yard, and as soon as the frigate "Congress" had been launched work began upon the "Saratoga," and continued without interruption until July, 1842, when she was completed, and upon the 26th of that month was launched.

The appropriation for the improvement of the yard for the year 1843 was $41,000, which allowed some work to be done on the walls and buildings. The sloop-of-war "Portsmouth" was built and launched this year; she was an exact counterpart of the "Saratoga," and built in the ship-house recently vacated by that vessel.

On the 2d of November, Capt. Sloat was relieved by Capt. George W. Storer as commandant of the yard.

The boat-house and landing-stage was built in 1844, at a cost of $1221.50, and work commenced in blasting away the ledge in the middle of the island; with this exception no other improvements were made on the yard until 1846.

November, 1846, Commodore Daniel Turner relieved Capt. Storer in command.

The attention of the Department had been attracted to the subject of a dry-dock at this yard, and a board of civil engineers, under Mr. Sanger, was ordered to examine the island for the purpose of locating the site. The subject was discussed in all its points, and the board finally decided that a floating dock would be much cheaper and better suited to the requirements of this yard than a stone dock, and reported its views to the bureau. A controversy then arose between the two inventors of floating docks. Messrs. Gilbert & Secor, the inventors of the floating balance-dock, claimed for their invention a superiority over that of the sectional-dock of Messrs. Moody & Dakin; the bureau was much embarrassed by these conflicting claims, and finally settled the controversy by building two of each at the different yards. Cisterns were built in different parts of the yard at a cost of $31,528.

In May of 1847 the keel of the steamer "Saranac" was laid in the new ship-house. Mr. Parris reported as civil engineer of the yard, retaining Mr. Brown as his assistant. In 1848 the work of leveling was carried on with vigor. The smithery was enlarged and rebuilt, and the sea-wall finished to the knee-dock. In November, 1848, the side-wheel steam-frigate "Saranac," the first steamer built at this yard, was launched. The powder-magazine, which had been commenced the year previous, was finished in 1849. Capt. Thomas W. Wyman relieved Commodore Turner as commandant on the 2d of November, 1849.

In 1851 a contract was entered into with Messrs. John S. Gilbert and Zeno Secor, of New York, to construct, with all the necessary machinery and appendages, a floating balance-dock and railway to the satisfaction of the superintending engineer. The test was made in June, 1852, and the works accepted.

Mr. Parris, the civil engineer, having died, B. F. Chandler, Esq., was appointed to fill the vacancy, and entered at once upon his duties. The site having been selected, a coffer-dam was constructed, within which the excavations were to be made for the foundations, floors, and walls of the dock-basin. The whole was to rest on a foundation of piles, 3000 of which were driven through the earth to solid rock. They were placed 3 feet from centre to centre and the interstices filled with clay; they were then cut off 12 feet below high-water mark, capped with timber, and the entire surface covered with 5-inch plank. Five courses of hammered granite in the direction of the length of the dock were laid of 1 foot rise, and a bed of concrete 6 inches thick between the stone bearings. The basin completed is 360 feet in length and 125 feet in width, with granite walls 14 feet high of large stone, hammered beds, builds, joints, and face, and laid in cement; at the outer end of the walls of the basin, and across the bottom in the stone-work, is a groove cut 2 inches wide and 6 inches deep to receive the keel and stems of a boat-gate, which, when in place, incloses the dock within the stone basin. The dock was constructed on the island opposite the navy-yard, called Pierce's Island, and when completed was floated across the river. The

length of the floating dock is 350 feet; breadth outside, 135 feet 4 inches, and walls 38 feet high. The walls or chambers on each side are 7 feet 8 inches wide, the entire length of the dock. On these walls and amidship of the dock is the machinery for working it while docking or undocking vessels. November 1, 1852, Capt. Wyman was relieved by Capt. Joseph Smoot. During this winter but little was done on the yard in the way of improvements. The new ship-house was lengthened 50 feet and the keel of the frigate "Franklin" laid therein, the old ship being under process of demolition. In the month of February, 1855, the frigate "Santee" was launched, having been in process of construction since 1820. The keel of a light-ship was laid in the ship-house soon after the launching of the "Santee," and in the summer of the same year she was launched.

Commodore John T. Newton relieved Capt. Smoot as commandant of the yard in October, 1855, and the remainder of this year was devoted to finishing up the work already begun, and in hurrying to completion the frigate "Franklin," now well under way.

In April, 1856, permission having been obtained from the Navy Department by the inhabitants of Seavey's Island, a bridge was built from the navy-yard across the narrow stream which separated it from that island; this bridge was of course to be subject to the discipline of the yard, but as may be readily seen, was the occasion of much annoyance to the yard authorities, as well as discomfort to the inhabitants of the island. In order to avoid theft from the government, persons carting private material through the yard were compelled to submit their loads to the inspection of the watchman; and at night, even packages carried by persons were subjected to examinations; the continued vexations attending this privilege of passing through the yard ultimately led to the purchase of the adjoining island by the government.

In July of 1857, Commodore J. T. Newton, while on a leave of absence, was smitten with paralysis, and after a few hours of great suffering expired.

Commander Charles W. Pickering, being senior officer present, assumed the command of the station until relieved by Capt. John Pope, on the 11th of August. During this year the fine building for offices and muster-room was finished and occupied, the entire cost of which was $28,633. The appropriation made in 1857 for this yard was $104,422, which admitted of many improvements being made that were much needed. The head-house was raised one story and a half, and fitted with machinery; the magazine buildings finished, a lodge built for the ordinary men of the yard at a cost of $4845, and iron fences substituted for the wooden ones around the quarters. The dry-dock was in use the greater part of the year, the "Vandalia," "Constitution," and sloop "Falmouth" having received repairs upon it; and during the year following the sloops "Portsmouth" and "Jamestown," having arrived from a cruise, were both docked and extensively repaired.

On the 1st of October, 1860, Capt. John Pope was relieved as commandant by Capt. G. F. Pierson.

The very threatening aspects which the political affairs of the country had assumed, caused the commandant to request permission to fortify the defenses of the harbor early in 1861.

On the 27th of April the commandant of the station received orders to put the yard on a war footing; fortify the earth-work on Seavey's Island with 8-inch guns; open a rendezvous in Portsmouth for recruiting men both for the navy and marine corps. He was also empowered to examine and appoint officers, subject to the approval of the Department. The "Santee" and "Sabine," frigates, "Marion" and "Dale," sloops-of-war, were fitted out and sailed on a cruise. War was now considered as declared with the Southern States that had seceded. All officers in command of ships of war were instructed to capture, sink, burn, or destroy vessels on the high seas hostile to the U. S. government, or having on board articles contraband of war. The keels of two steam sloops-of-war were laid, the "Kearsarge" and "Ossipee." The latter was launched in November, and the former in December. The steam-sloops "Sebago," "Mahaska," "Sacramento," "Sonoma," and "Connemaugh" were commenced in 1861. The two former were finished during the autumn, but the last two not until the spring of 1862. The yard was now worked to its full capacity, over 2000 men being employed. Additions were made to the ordnance-building, and the inspection building of provisions and clothing was also built, at a cost of $12,586.

During the years 1862–63 the following ships and gunboats were built, launched, and fitted for sea at this yard: "Sebago," "Sonoma," "Sacramento," "Connemaugh," "Mahaska," "Ossipee," and "Sassacus." The "Constellation," "Colorado," and "Minnesota" were also repaired and fitted for sea, and work during these two years had progressed upon the steam-frigate "Franklin" so as to insure her completion in a short time should she be needed. Several temporary sheds were erected about the yard to accommodate the different departments, which were now being crowded to their utmost extent with work.

During the year 1863 the gunboats "Patuxet," "Nipsic," and "Shawmut" were built, launched, and fitted for sea; and the frigate "St. Lawrence," bark "Fernandina," and steam-sloops "Alabama," "Dacotah," and "Agawam" were repaired and fitted for sea in addition to those already mentioned. On the 18th of November the keel of the ironclad "Passaconaway" was laid in ship-house No. 4. On the 4th of February the porter's lodge took fire and was entirely consumed in a short time, a heavy wind blowing from the northwest, and the mercury being 13 degrees below zero rendered all assistance impossible.

The year 1864 opened gloomily for the country; the war dragged along, and the yard still continued to teem with workmen and the wharves to be crowded with vessels. The sloop-of-war "Vandalia" had been ordered to this station for a guard as well as a receiving-ship. On the 23d day of January the ship-of-the-line "New Hampshire" was launched (she was the "Alabama," 74, whose keel was laid on the 15th of April, 1817), having been upon the stocks 47 years. She was fitted as a store-ship and sent to Port Royal, S. C.

During this year the "Colorado" was repaired, docked, and fitted for sea; 2 tugs built and launched,—the "Port Fire" and "Blue Light"; the ironclad "Agamenticus" launched and fitted for sea; "Iosco" taken into dock and repaired; "San Jacinto" repaired and fitted; the steam sloops-of-war "Piscataqua," "Minnetonka," and "Illinois" built; the frigate "Franklin" finished and launched, and the sloop "Contoocook" launched, also several of the small purchased vessels were docked and refitted. The boat- and carpenter-shop was built this year by contract, Messrs. Clement & Cressey doing the work. Numbers of vessels were now arriving at the yard from Southern ports, and many cases of yellow fever were discovered, which caused much alarm in this vicinity.

In July the "De Soto" arrived, and after remaining a short time in the lower harbor steamed up to the yard and was put out of commission. Immediately the fever broke out among the workmen on this ship, and in many cases proved fatal. The sail-loft was closed, the yard put in quarantine, and the ship removed to the lower harbor.

In October, Commodore T. Bailey relieved Commodore Peirson as commandant of the station.

In 1866 the adjoining island was purchased by the government for $105,000. This island contains about 105 acres, with an extensive water front; the stream separating the two can be filled in, and the area thus added will be sufficient for the requirements of the navy-yard for years to come. The wings of the office-building were raised and extended, a crane built, and a new steam fire-engine added to the fire department of the yard this year. October, 1867, Commodore Joseph Lanman relieved Commodore Bailey as commandant. Coal-sheds were erected on Seavey's Island and residences furnished upon that island for the naval constructor and civil engineer attached to the yard; an iron building erected for a boiler-shop for steam-engineering department at a cost of $15,000. The U. S. S. "Benicia" was finished and launched, and the steam-sloop "Monongahela" was taken upon the railway to be rebuilt, having been thrown ashore by the tidal-wave following the great earthquake at the island of St. Croix, West Indies, the year previous. During the year following, 1869, Commodore J. A. Winslow relieved Commodore Lanman.

The fire-engine house was also built this year at a cost of $8940, and the wings which were added by Commodore Howell several years after at an expense of $800, made the entire structure cost $9400. In July, 1870, Commodore A. M. Pennock relieved Admiral Winslow in command of the yard. But little improvement was made to the yard owing to the meagre appropriations for that purpose during 1870, 1871, and 1872. The "Narragansett" was fitted out, work was progressing on the "Monongahela," and the sloop "Illinois" was taken to pieces. On the 10th of October, 1872, Commodore John C. Howell relieved Admiral Pennock.

The appropriation for this yard having been increased, work was at once begun in the various departments of the yard. A chain-shed was built; the floating dock extensively repaired; a truss-bridge built to connect the yard with Seavey's Island; gas-pipes laid, gas-works built, and gas introduced for lighting the yard and quarters; wharf and bridge built on Seavey's Island; tool-house built and portico, etc., added to the commandant's quarters. In addition to these repairs and improvements, the beautiful waiting-house at the Portsmouth landing was built to take the place of the miserable shed which had been in use many years.

The "Monongahela" was rebuilt and refitted and the "Marion" steam-sloop launched. Two steam sloops-of-war were begun in 1873, and both launched the year following; the "Enterprise" being the first of these two sloops launched. She was built by contract by Mr. J. Griffiths, the government furnishing everything excepting labor. The sloop "Essex," the other of the two sloops constructed at the yard, was built entirely by the government. Much difficulty was experienced during the summer of 1874 in supplying the yard with fresh water, owing to the dryness of the season; in fact, it was the occasion of much anxiety, as the various workshops in the yard are dependent upon fresh water to fill their boilers. The fact was laid before the Department, and several propositions were made. One was to cover an artesian well on the island, the estimated cost of which did not fall short of $60,000, owing to the peculiar formation of the strata. By an accidental discovery of several springs upon Seavey's Island, it occurred to the commandant that a dam might be so constructed as to save the water that escaped and form a pond in the valley, which was already swampy. It was done at small cost, and in a short time a large pond was formed, which is now a never-failing source of supply, being conducted by pipes to a cistern in the yard. The entire cost of this work, including a steam-engine for pumping the water into the reservoir for distribution, was less than $500. This pond has never failed to supply the yard with water, and in the winter also with a large supply of heavy ice, which is stored for the use of the yard and the sick at quarantine: several hundred tons of this refreshing commodity is thus saved every year.

Kittery bridge, which for some time had been considered as unsafe, was extensively repaired and put in complete condition.

In October, 1874, Commodore Howell was ordered to Washington as chief of the Bureau of Yards and Docks, and he was relieved by Commodore Andrew Bryson, who was succeeded in 1876 by Commodore Jno. Guest. Commodore Guest died on January 12, 1879, while in command of the yard, and the present commandant, Commodore J. C. Beaumont, was ordered to the command.

Navy-yard, Washington, D. C. This yard was established in 1800, the ground on which it stands having been purchased for $4000. It is bounded by East Sixth and East Ninth Streets, M Street south, and the East Branch of the Potomac River. This area covers about 20 acres, and is inclosed by a substantial brick wall, having the principal entrance at the foot of Eighth Street, through a handsome arched gateway. The extensive workshops comprise foundries, forges, rolling-mill, and machine-shops. The grounds are beautifully laid out, and the officers of the yard have commodious residences within the walls. This yard is the principal ordnance depot of

the navy, and it contains a laboratory, where cartridges, signal-lights, etc., are manufactured. For years the navy has been supplied with anchors and cables from this yard, and since the new rolling-mill has been started it turns out all the chain and most of the round iron used by the navy. The first chain-cable manufactured by the navy was made at this yard in 1829, and from that date up to August, 1868, there had been manufactured 828 cables, besides hundreds of anchors and small chains. Very little ship-building or repairing has been done here, the frigate "Minnesota" being the largest and most important vessel built; she was launched in 1856. During the years of the Rebellion the Washington Navy-Yard was a scene of ceaseless activity; it was the headquarters of the Potomac Flotilla, and vessels from other stations were frequently sent to this station for repairs and supplies; the yard at that time proved of almost inestimable value to the government. It has been commanded by a long line of distinguished officers, among whom may be mentioned Commodores Aulick, Buchanan, Stevens, Radford, Poor, Patterson, and Febiger, and the late Rear-Admiral Dahlgren was for many years stationed at this yard as ordnance-officer, and at the outbreak of the Rebellion in 1861, Capt. Dahlgren and Lieut. Russell were the only officers then stationed here who remained loyal, all others from the commandant down resigning and joining the Confederacy. Capt. Dahlgren commanded the navy-yard from 1861 to 1863, and again from 1866 to 1868.

Neap Tides (Sax. *neafte*, scarcity). The smallest tides; they take place after the first and third quarters of the moon, when the sun and moon do not act in the same line. See TIDE.

NEAPED, or BE-NEAPED. The situation of a ship left aground on the spring-tides so she cannot be floated off until the occurrence of the next spring-tides.

Near. *Near* and *no near* are terms sometimes used for *no higher*. See HELM.

Nebular Hypothesis. Although Laplace is generally considered the originator of this hypothesis, it is not strictly true. Kant, a few years before, had in point of fact announced this theory, but Laplace was the first to bring it to general notice. He supposed the atmosphere of the sun to have filled the whole space now occupied by the solar system, and to have existed as a vast revolving nebulous mass, which, gradually cooling and contracting, threw off, in accordance with mechanical and physical laws, successive rings of matter, from which, in obedience to the same laws, were produced the planets and satellites. He was led to this theory from the uniformity of direction in the movements of the planets.

This hypothesis has given rise to much discussion. Many advocates of it have contended that it fully satisfies the present condition of affairs. Prof. Ennis undertook to prove that gravity and contraction acting on a nebulous mass would cause a rotation about an axis, and thus start the mass in motion, so that it would necessarily throw off the planetary rings. Others have shown the weak points in the hypothesis so conclusively, that a modification of it is now generally conceded necessary in order to cause it to be generally accepted.

The writer has advanced the idea that repulsion was a force overlooked in this theory of cosmogony. If gravity attracts masses to the sun, there must be another force, and by analogy we would expect it to be differently developed, which expends energy in repelling bodies from the sun. Gravity acts directly between the bodies attracted and the sun. Repulsion acts from the sun in every direction, being diffused as the light of a lamp; it is given off by all bodies, now cooling and contracting in every direction, its intensity being, like gravity, inversely as the square of the distance. A body is attracted to the sun according to its weight; it is repelled according to its size. There is nothing in this idea that conflicts with Newton's law of universal gravitation, for the difference between these two forces would satisfy his law. Repulsion and centrifugal force acting together exactly balance the force of attraction. Such a force as this would give permanence to the places and orbits of the planets; for, were they disturbed by a comet or other body, they would naturally return to that distance from the sun where the forces exactly counterbalance.

The force of gravity, exactly balanced by centrifugal force, is an unstable equilibrium; but the supposition of a third force makes a stable equilibrium.

If we suppose all other suns to have a repulsive force, all nebulous matter would be driven to the confines of the systems; there it would reach a place of comparative rest, its attraction towards the systems counterbalancing the repulsive force of all the repelling bodies. This mass would now commence to contract, the power of gravity as it contracts would cause it to move towards the systems; as it approached the heavenly systems the force of repulsion would increase rapidly, and consequently the mass would begin to change its course, avoiding the centre of attraction and repulsion; owing to the resistance met the centre of gravity would be in advance of the centre of figure, and a motion of rotation must necessarily ensue. We now have the nebular mass in the condition required by the hypothesis of Laplace.

This force of repulsion would also regulate the throwing off of the planetary rings. When the planets formed and moved in their orbits about the sun, the centre of weight would be in advance of the centre of figure, repulsion would then cause a rotation on an axis approximately perpendicular to the plane of their orbits and from west to east.

But repulsion has also an important part to act in the gradual dissipation of the system back to nebulous matter; it is illogical to advocate any explanation of the growth of any system or systems without indicating the way for its decay and return to its original condition. Everything we see in nature follows the general law of reproduction, and it is an acknowledged fact that the same laws prevail in the greatest as in the least of the processes of nature.

I take it for granted that there is a medium in space for the transmission of heat and light, and that it necessarily offers some resistance, no matter how slight, to the heavenly bodies. This resistance causes the greater part of the atmosphere of a planet to follow it, and thus causes the centre of attraction to be ahead of the centre of figure,

the two forces acting at these points in different directions causes diurnal motion. The resistance of the ether of space would cause the planets to gradually stop in their orbits were it not for the slight increase of orbital motion caused by diurnal motion. This increase exactly counterbalances the retardation of orbital motion caused by the ether of space.

Now, it is apparent that if such is the case, upon a planet becoming solidified in its old age its atmosphere would disappear, and consequently diurnal rotation would cease, and orbital motion itself would gradually come to an end. As there is no loss of motion possible, both these motions would be converted into molecular motion, and disruption would occur just as sure as it would occur if the earth were suddenly stopped in its orbital and diurnal motions. The various pieces would follow erratic orbits, and sooner or later fall to the sun only to be repulsed again, and thus, by slow attrition, reach the nebulous condition.

Comets, meteors, and systems of meteors have a tendency to fall to the sun, and are repelled again, each time suffering some dissipation from his heat. They are thus gradually converted into nebulous gas, and driven to the confines of the systems, where they go towards forming a new system.

The sun would, according to the same laws, finally suffer disruption. He would continue to be attracted and repelled by the united efforts of all other suns, and would, in time, suffer the fate of his own planets. The same matter would not again, as a whole, form a new system any more than an old tree furnishes all the matter for its successor.

The nebular hypothesis has been generally advocated by evolutionists, who have used it as an argument in opposition to the belief of a miraculous creation by the Almighty.

But it is evident that if worlds and systems of worlds come into existence according to law, to run the natural course of growth and decay, it requires a law-giver, just as a miraculous creation requires a creator.—*R. M. G. Brown, Lieutenant U.S.N.*

Necessity. If a ship be compelled by necessity to change the order of the places to which she is insured, it is not deemed deviation, and the underwriters are still liable.

Necklace. Formerly, a chain around the lower mast to which the futtock-shrouds were secured. Also, a strap around a mast, carrying leading-blocks.

Neckur. A Scandinavian sea-sprite, whence some derive our "Old Nick" in preference to St. Nicholas, the modern patron of sailors.

Needle. The magnetized bar of steel in the mariner's compass; the form used by the Chinese was like a needle, being a light thin wire. It is now a regular parallelopiped with the narrow dimension placed vertically. See COMPASS, THE MARINER'S.

Needle-fish. The shorter pipe-fish, stang, or sting, *Sygnathus acus.*

Needle-gun (Germ. *Zündnadelgewehr*). A breech-loading fire-arm having a needle or pin traversing the breech-block, which, upon being struck by the hammer, is driven into the fulminate, igniting it and exploding the cartridge. The needle-gun was invented by Nicholaus Dreyse, and, until superseded by the Mauser gun, it was the regulation weapon of the German infantry. Its efficiency has been demonstrated in all the German wars since 1848. It is clumsy and complicated, but excellent for precision and rapidity of discharge.

Negligence. If an agent or broker engages to do an act for another, and he either wholly neglects it, or does it unskillfully, an action on the case will lie against him.

Nelly. *Diomedea spadicea*, a sea-bird of the family *Procellaridæ*, which follows in the wake of a ship when rounding the Cape of Good Hope.

Nelson, Horatio, Lord, was born on the 29th of September, 1758, at Burnham Thorpe, Norfolk. It would be impossible to find a name in the naval annals of the whole world more justly celebrated for skill, valor, and success than that of the British sailor "Nelson and Bronte." He served a long apprenticeship to the ordinary duties of a naval officer before he had an opportunity of making a reputation. Begining his career in the Arctic Seas, and serving afterwards in the West Indies, the coast of Mexico, and of Canada, always commanding respect for his steady perseverance, his intelligence, and intrepidity, he obtained a command in January, 1793, and soon earned fame in independent action. Ordered to the Mediterranean to protect the interests of Italy and England against the assaults of the French revolutionists, he joined the "Corsican Paoli," and besieged Bastia. Never resting while an enemy was to be met, he boarded and captured several French and Spanish men-of-war. In 1797 he was appointed to join Sir John Jervis in the "Captain," 74, and on board that vessel took part in the victory off Cape St. Vincent, which secured for Jervis his elevation to the peerage. The service which Nelson rendered in boarding two Spanish ships raised him to the rank of rear-admiral, added to which were the insignia of the Bath and a gold medal. In an operation against Santa Cruz, Admiral Sir Horatio Nelson lost his right arm. In 1798 he was sent in pursuit of a powerful French fleet then covering the operations of a French army under Napoleon in Egypt. Finding the fleet at anchor in Aboukir Bay, near Alexandria, Sir Horatio immediately delivered battle. A tremendous conflict ensued, which terminated in the complete annihilation of the French armament. This action is known in English history as the "Battle of the Nile."

Denmark, Sweden, and Russia having combined to place limits to the naval power of England, Admiral Sir Hyde Parker was dispatched to the North Sea to crush the confederacy. Nelson hoisted his flag in the "Elephant," and led the way to the Baltic. Meeting the combined fleet, the English gave them battle, and the upshot was the complete destruction of the hostile alliance. For this exploit Nelson was raised to the dignity of a viscount, and placed in command of the fleet in the North Sea. Campbell, the poet, has immortalized the "Battle of the Baltic."

Napoleon Bonaparte, intending to invade England, had assembled a large military force at Boulogne, and only awaited the arrival of a powerful fleet to convoy the troops across the Channel. Aware of this fact, Lord Nelson, with a

squadron, went in search of the French ships to prevent their approach to Boulogne. Failing to find the fleet in the West Indies he recrossed the Atlantic, and came up with the object of his search off Cape Trafalgar, near the entrance to the Strait of Gibraltar. He patiently awaited them at the mouth of Trafalgar Bay, and when the fleet emerged from its retreat under Admiral Villeneuve, he gave it battle on the morning of the 21st of October, 1805. The two forces were of equal strength, but the form of attack adopted by Nelson gave the British so great an advantage that, after a fight of many hours' duration, the French struck their colors. Nelson's ship was the "Victory," and he stood on the quarter-deck during the whole of the engagement. Wearing all his stars and other decorative insignia, he was a conspicuous mark for the riflemen, and by one of them in the mizzen-top of a French man-of-war he was shot dead. Mourned by the whole British nation he was decreed a pompous funeral, and his remains lie in the crypt of the Cathedral of St. Paul's.

Neptune. The place of this planet was computed by Le Verrier and Adams in 1845–46, from the known perturbations of Uranus. It was first seen at Berlin, September 23, 1846, only 52′ from its place as determined by Le Verrier from his computations. Mean distance from the sun, 2860 millions of miles; period of revolution, 165 years; diameter, 40,000 miles; apparent diameter, 3″; symbol ♆, a trident.

Neptune. The god of the sea. See SEA-GODS.

NEPTUNE'S GOBLETS. The large cup-shaped sponges found in the Eastern seas,—*Raphyrus patera.*

NEPTUNE'S SHEEP. Waves breaking into foam, called white horses.

Nest. See CROW'S NEST.

Netting. A net-work of small lines used for various purposes. See BOARDING, HAMMOCK, SPLINTER.

Nettle. Two or three yarns laid up by hand; used for hammock-clews and neat seizings. *To nettle*, to provoke.

Neutral. A state that takes no part in a war between other states. See INTERNATIONAL LAW.

Newark is a port of entry and city of New Jersey, in Essex County, on the Passaic River, 4 miles from Newark Bay. Lat. 40° 45′ N.; lon. 74° 10′ W. Pop. 136,983. It is the largest city in the State, and its rapid growth is due to its extensive manufactories, the principal of which are carriages, beer, machinery, castings, jewelry, shoes, harness, and clothing. The commerce is principally confined to the coast trade, which is very large and important.

New Bedford, Mass., is situated in Bristol County, near the mouth of the Acushnet River, in lat. 41° 38′ N., lon. 70° 56′ W. The river forms a commodious harbor, which at Clark's Point is defended by a strong fortification of granite. This town has been more largely engaged than any other town in the world in the whale-fisheries, employing at one time 400 vessels, which has now declined to a fleet of 125. Since the decline of its whale-fisheries the town has become a manufacturing city, the Wamsutta and Potemska cotton-mills, flouring-mills, and various other manufactories having located here. Pop. about 26,000.

39

Newburyport is situated on the Merrimac River, 3 miles from the ocean, in Essex County, Mass., in lat. 42° 48′ 32″ N., lon. 70° 52′ 47″ W. It contains a custom-house, marine museum, has extensive manufactures of cotton goods, machinery, and boots and shoes; ship-building is also carried on. The harbor is safe and spacious, but is obstructed at the entrance by a sand-bar. Pop. 13,500.

Newcastle-upon-Tyne. A city and port of England, in Northumberland County, on the left bank of the Tyne, 8 miles from its mouth. The manufactures are very extensive, and within the city and its immediate vicinity are numerous blast-furnaces, malleable and other iron-works. Iron goods, fire-arms, ordnance, bronze goods, hardware, etc., are among the principal articles of manufacture. There are also extensive saw-mills and ship-building yards, at which large numbers of sailing-vessels and steamers are constructed. The import and export trade are very important. Pop. 128,500.

Newcome. An officer commencing his career. Any stranger or fresh hand newly arrived.

Newell. An upright piece of timber which receives the tenons of the rails that lead from the breastwork of the gangway in old-style ships.

New Haven, a port of entry and the county-seat of New Haven County, and the largest city in Connecticut, is situated at the head of New Haven Bay, 4 miles from Long Island Sound, in lat. 41° 18′ 23″ N., lon. 72° 56′ 30″ W. It is quite an extensive business centre, having a large inland and coastwise commerce, also a considerable foreign trade, carried on both direct and through New York, the exports in 1879 amounting to $2,362,385, comprising nails, starch, breadstuffs, and fire-arms, and the imports, mostly sugar, molasses, iron, steel, etc., amounted to $788,181. A vast quantity of fire-arms and cartridges are manufactured here by the Winchester and other arms companies. Pop. 63,000.

New London, a port of entry and city of New London County, Conn., is situated on the river Thames, 3 miles from the ocean, in lat. 41° 22′ N., lon. 72° 9′ W. The harbor is one of the best in the United States, is 3 miles long, with 30 feet depth of water. Above the city, on the east side of the river, is the U. S. Navy-Yard, and below the city are Forts Trumbull and Griswold. The citizens own numerous vessels engaged in the seal, whale, and other fisheries, and the city also contains manufactories of sewing-silk, mowing-machines, cotton-gins, machinery, etc. Pop. 10,000. See NAVAL STATION.

New Moon. See MOON.

New Orleans, La., is the commercial metropolis of the Gulf States. It is situated on the Mississippi River, about 100 miles above its delta, in lat. 29° 58′ N., lon. 90° 5′ W. As a port of entry it includes, besides its own port, those of Pittsburgh, Pa., Wheeling, W. Va., Louisville, Ky., Nashville and Memphis, Tenn., Cincinnati, O., St. Louis, Mo., Evansville, Ind., Galena and Cairo, Ill., Omaha, Neb., La Crosse, Wis., Burlington and Dubuque, Iowa. New Orleans is the great cotton market of the country, and it is the grand centre of commerce of the entire Mississippi Valley. The value of its exports in 1879 amounted to $81,105,822, and its imports, $8,259,606. The jetties in the river at Port Eads, below the city, now give 30 feet of

water over the bar at the mouth of the river, and the commerce is rapidly increasing. Pop. 207,000.

Newport, Christopher, Captain, commanding an expedition authorized by James I. to carry emigrants to Virginia, sailed with 3 ships, of not more than 100 tons burden each, on December 19, 1606. Roanoke was the objective-point, but a violent storm drove the expedition to the north of its destination, which was so far fortunate that it enabled Capt. Newport, after sighting and naming Cape Henry and Cape Charles, to enter Chesapeake Bay. Thence he entered the Powhatan, to which he gave the name of the James River. He thus became a discoverer, by accident, of localities of great importance and interest. Out of this discovery arose Jamestown, the first city of English origin ever established in America.

Newport, R. I., is a port of entry and fashionable watering-place, situated on Narragansett Bay, in lat. 41° 29′ N., lon. 71° 19′ 12″ W. It has a good harbor, deep enough to float the largest ships, which is defended by Fort Adams, a granite fortress, which mounts 468 guns. The magnificent steamboats plying between New York and Fall River touch at Newport every day. The Torpedo School of Instruction of the U. S. navy is situated on Goat Island, immediately opposite the city, and about ½ mile distant. The city contains manufactures of cotton goods, brass, copper, flour, fish, oil, etc. Its commerce was ruined by the war of independence, which also nearly depopulated the town, and it has never recovered its commercial importance. Pop. about 15,000.

News (*Eng.*). *Do you hear the news?* A formula used in turning up the relief watch.

New York, the most populous and important city of the western hemisphere, and the commercial metropolis of the nation, is situated chiefly upon Manhattan Island, which is 13½ miles long on the Hudson River side and 8 miles long on the East River side, separated from the mainland by the Harlem River and Spuyten Duyvil Creek. Lat. of city hall, 40° 42′ 43″ N.; lon. 74° 0′ 3″ W. The city includes also the islands in the bay (Ellis, Bedloe's, and Governor's), and Ward's, Randall's, and Blackwell's in the East River. The southern end of the island is occupied by vast wholesale and importing warehouses, the retail trade lying north of Fourteenth Street. The headquarters of the military division of the Atlantic are situated on Governor's Island, and the other islands of the bay and East River are nearly all occupied by fortifications, magazines, etc. The entrance to the harbor, called the Narrows, is defended by Fort Wadsworth on Staten Island and Fort Hamilton on Long Island, and in the bay and East River are situated Forts Columbus, Wood, and Schuyler. The Treasury Department reports show that for 20 years, from 1859 to 1879, about 56 per cent. of all the exports, and about 65 per cent. of all the imports, of the United States were sent and received through the port of New York; 73 per cent. of the bullion and coin exported went from New York, about 70 per cent. of the duties was collected here, and more than 50 per cent. of the aggregate tonnage of the United States was registered in this city. The tonnage of vessels registered in 1879 was 24,155,157 tons, the value of imports for that year was $1,718,695,720, and the exports $1,678,328,316. The domestic trade is also immense, largely exceeding the foreign. The manufactures are very extensive, comprising all varieties of textile fabrics, machinery, musical instruments, ales, beers, cordage, and sails; vessels and steamships of all kinds are also built and repaired here; foundries and blast-furnaces for the manufacture of all kinds of castings and machinery are principally located along the East and Hudson Rivers and their immediate vicinity. Manhattan Island was discovered in 1609 by Henry Hudson, an English navigator employed by the Dutch East India Company. Settled by the Dutch in 1612, it surrendered to the English in 1664; it was retaken by the Dutch in 1673, and held by them for one year only. In 1783 it was evacuated after a long possession by the British troops. Its population in 1790 was 33,131; its present population, by the census of 1880, is 1,209,561.

Nib-block. A metal block having a rigid hook which causes the block to stand square.

Nichols, Edward T., Rear-Admiral U.S.N. Born in Georgia, March 1, 1823. Appointed from Georgia, December 14, 1836; attached to sloop "Levant," West India Squadron, 1837–40; Naval School, Philadelphia, 1841–42.

Promoted to passed midshipman, July 1, 1842; frigate "Columbus," Mediterranean Squadron, 1842–44; steamer "Colonel Harney," Atlantic coast, 1845; frigate "Columbia," Brazil Squadron, 1845–47; bomb-vessel "Stromboli," Home Squadron, 1847–48; frigate "Savannah," Pacific Squadron, 1849–51.

Commissioned as lieutenant, March 13, 1850; navy-yard, Pensacola, 1852–53; steam-frigate "Saranac," Mediterranean Squadron, 1853–56; navy-yard, Portsmouth, N. H., 1857–58; sloop "Jamestown," Home Squadron, 1858–60; commanding steamer "Winona," West Gulf Blockading Squadron, 1861–62; bombardment of Forts Jackson and St. Philip; present at and received the surrender of Fort St. Philip, April 28, 1862; attack upon and passage of Vicksburg batteries, June 28, 1862; engagement with rebel ram "Arkansas"; bombardment and passage of Vicksburg batteries, July 15, 1862.

Commissioned as commander, July 16, 1862; commanding steamer "Alabama," West India Squadron, 1863; commanding steamer "Mendota," North Atlantic Blockading Squadron, 1864–65; engaged with rebel battery at Four-Mile Creek, James River, June 16, 1864; special duty, New York, 1866–68.

Commissioned as captain, July 25, 1866; chief of staff, Asiatic Squadron, 1870–72.

Commissioned as commodore, May 24, 1872; commandant navy-yard, Boston, 1872–76; member of Board of Examiners, 1877.

Commissioned as rear-admiral, February 25, 1878; commanding South Atlantic Station, 1878–80; light-house inspector since June 30, 1880.

Nicholson, Captain James, was born in Chestertown, Md., in 1737. He was first appointed to the "Virginia," 28 guns. She was lost in the Chesapeake Bay in the year 1778. An inquiry was instituted by Congress 18th April, but the result attached no degree of censure to Capt. Nicholson. On the 2d of June, 1780, in command of the "Trumbull," 28 guns, he had an action

with the "Watt," a letter of marque, supposed to be fully a match for one of our heaviest frigates. She was greatly superior in guns and in number of men to the "Trumbull." The action was within pistol-shot, and being maintained with great gallantry on both sides, it lasted, it is said, nearly 3 hours, when Capt. Nicholson having lost his main- and mizzen-masts, and the foremast being badly wounded, was reluctantly constrained to discontinue the contest, an event which it is presumed was not displeasing to the commander of the "Watt," whose loss has been stated at 90 men killed and wounded. The "Trumbull's" loss (29) in killed and wounded was less than one-third of that number. On the 8th August, 1781, the "Trumbull," with a very reduced crew, estimated at 180 men only, sailed from the Delaware. She had scarcely cleared the capes when 3 enemy's ships were descried in the east. The "Trumbull's" fore-topmast and main-topgallant-mast having been carried away, she could steer only directly before the wind. She had not cleared away the wreck of her fore-topmast, when one of the ships, the British frigate "Iris," came alongside, the other two being in sight. An action was commenced with the "Iris," and was continued for more than an hour, and rather to the advantage of the "Trumbull," when another of the ships (a frigate also) came up and fired into her. A contest against such odds could not be maintained with any prospect of success, neither could Capt. Nicholson escape, his vessel being a perfect wreck, not having a mast standing. The colors were therefore struck. Alexander Murray, who had recently been appointed a lieutenant in the navy by Congress, was a volunteer on board the "Trumbull," and displayed great gallantry in the action. Nicholson died in New York City, Sept. 2, 1804.

Nicholson, J. W. A., Commodore U.S.N. Born in Massachusetts. Appointed from New York, February 10, 1838; attached to sloops "Natchez" and "Warren," West India Squadron, 1838–41; to "Brandywine," frigate, Mediterranean Squadron, 1841–42; special service, 1842–43.

Promoted to passed midshipman, June 20, 1844; steamship "Princeton," 1844–46; Pacific Squadron, 1846–47; store-ship "Fredonia," 1848; frigate "Raritan," 1849–50; "Southampton," store-ship, Pacific, 1851–52.

Promoted to lieutenant, April 24, 1852; sloop "Vandalia," Japanese Expedition, under Commodore Perry, 1853–55; participated in all of the official meetings with the Japanese on that expedition; stationed on shore, with a guard from the "Vandalia," at Shanghai, China, for several months, to protect the foreign settlement, while the contending Chinese were encamped near by; navy-yard, New York, 1856–57; sloop "Vincennes," African coast, 1857–60; 1861, attached to steamer "Pocahontas," which vessel started for the relief of Fort Sumter, but arrived too late, as the fort capitulated, a short time after the arrival of the "Pocahontas," on April 13, 1861; stationed in Potomac River until October, 1861; engagement with rebel batteries at Acquia Creek; in command of steamer "Isaac Smith," 1861, and participated in actions with rebel fleet, November 5 and 6, and battle of Port Royal, November 7, 1861; also participated in the capture of Jacksonville, Fernandina, and St. Augustine, Fla.; held the towns of Jacksonville and St. Augustine for several months; while in command of St. John's River, was attacked by rebel infantry, and defeated them with considerable loss; engagement with rebel flotilla in Savannah River, February, 1862.

Commissioned as commander, July 16, 1862; ordnance duty, New York, 1863; South Atlantic Blockading Squadron, 1864; command of monitor "Manhattan," Western Gulf Squadron, 1864; battle of Mobile Bay forts, and capture of rebel ram "Tennessee," August 5, 1864; bombarding Fort Morgan from August 9 until the surrender on the 21st; commanding the steamer "Mohongo," Pacific Squadron, 1865–66; commanding steamship "Wampanoag," 1867–68.

Commissioned as captain, July 25, 1866; navy-yard, New York, 1868–70; commanding "Lancaster" (second-rate), South Atlantic Fleet, 1871–72.

Commissioned as commodore, November 8, 1873; member Board of Examiners, 1873–74; president Board of Examiners, 1875–76; commandant, navy-yard, New York, 1876–80.

Nidget. A coward. A term used in old times for those who refused to join the royal standard.

Nigger. A hoisting-engine in river steamers.

Nigger-head. An inferior quality of hard-rolled tobacco.

Night-cap. Hot grog taken just before turning in.

Night Order-book. A memorandum in which the commanding officer writes his orders concerning the management of the ship during the night.

Nilometer. An instrument for measuring the height of the water in the Nile.

Nimbus. The rain-cloud. See CLOUD.

Nine-pin Block. A swivel-block shaped somewhat like a nine-pin, and formerly used as a fair-leader under the fife-rail.

Ning-Po is one of the open ports of China, situated on the Ning-Po River, in the province of Che-Kiang, in lat. 29° 51′ N., lon. 121° 32′ E. It has a large manufacture of silks, cottons, woolens, etc., and many junks are built here. It exports large quantities of wood and charcoal. Pop. about 200,000.

Nip. A jamming together of two fields of ice. A sharp turn in a rope. *To freshen the nip.* See FRESHEN.

Nipcheese. A sailor's name for the purser's steward.

Nipper. A short bit of soft rope used in binding the chain to the messenger in heaving up the anchor; it is put on close to the manger and taken off when it arrives near the deck pipe. With chain-cables and chain-messengers iron nippers are used; they consist of a hinged clamp having an iron ring, which is slipped over the end when the nipper is put on; when the nipper is to be taken off the ring is knocked off with a hammer. Nippers are now out of date, the chain being taken directly to the capstan.

NIPPER-MEN. Fore and main topmen who passed and took the nippers in heaving up anchor.

Nitre, or Saltpetre. The nitrate of potassium (KNO_3). It is spontaneously generated in the soil and crystallizes upon its surface in several parts of the world, especially in India. It is also

produced artificially by imitating the conditions of its natural production. The most essential of those conditions seems to be the presence of decaying organic matter, whose nitrogen is oxidized by the action of the atmosphere into nitric acid, which combines with the bases (potash and lime) contained in the soil. The method consists in forming upon a flooring of clay heaps of animal matters mingled with ashes and lime-rubbish, the heaps being exposed to the air but protected from rain, and at intervals moistened with urine or stable-runnings. In these heaps nitrate of lime is slowly formed, which is extracted by lixiviation, and carbonate of potash added to the solution, which, by double decomposition, gives rise to the formation of nitrate of potash and carbonate of lime; the latter is precipitated, the former remains in solution, and is obtained in crystals by evaporation. Nitre crystallizes in six-sided prisms, soluble in seven parts of cold water, and in less than its weight of boiling water. It has a cooling saline taste, and is anhydrous. At about 660° it fuses, and at a red heat is decomposed. Its most important use is in the manufacture of gunpowder, and it is also extensively employed in the manufacture of sulphuric acid, in the preparation of nitric acid, as an oxidizing agent in numerous chemical processes, as an ingredient in fire-works, and as a medicine.

Noah's Ark. Certain clouds, elliptically parted, considered a sign of fine weather after rain.

Nock. The forward upper corner of a trysail or spanker.

Nocturnal Arc. That part of a circle which is described by a celestial object, between its setting and rising.

Noddy. The *Sternia solida*, a darb web-footed sea-bird, common about the West Indies.

Node. One of the two opposite points in which the orbit of a planet or comet cuts the ecliptic, or in which the orbit of a satellite cuts that of its primary. When the body passes from north to south this point is called the *descending node;* the opposite point is the *ascending node.* The line joining the two points is called the *line of nodes;* in the case of the moon it moves backward slowly, completing its revolution in 18.6 years.

Nog. A treenail which projects from the bottom of a wooden ship, while in the course of building, as a stop to the heads of the shores; also, a treenail driven through the shores to secure them.

No Higher. See HELM.

No-man's Land. Any space, the cleaning, painting, etc., of which are neglected because it does not fall exclusively within the limits of the space assigned to any man or set of men.

Non-combatants. A term applied to the officers not of the line, as their duties do not require them actually to fight the guns nor manœuvre the ship.

Non-condensing Engine. An engine in which the exhaust steam is not condensed, but escapes into the atmosphere; formerly termed a *low-pressure engine.*

Nonius Scale. See VERNIER.

No! No! The answer to the night-hail, by which it is known that a midshipman or warrant-officer is in the boat hailed.

Nook-shotten. A Shakspearian expression for a coast indented with bays.

Noon (*Sax.*). According to the time reckoned by, noon is the instant the point of definition is on the meridian. When the centre of the sun is on the meridian, it is *apparent* noon; when the mean sun is on the meridian, it is *mean* noon; when the first point of Aries comes to the meridian, it is *sidereal* noon.

Noose. A running knot.

Nordenskjold, Professor. A Danish explorer of the Arctic Seas. Skirting the outer coast of the Scandinavian peninsula, he passed to the north of Europe and Asia, rounding the northernmost cape of the latter continent, and, after a winter in the ice, entered the Pacific Ocean. Thence he sailed along the eastern and southern coasts of Asia into the Persian Gulf, passed through the Red Sea, the Suez Canal, and the Mediterranean into the Atlantic. This was accomplished between 1878 and 1880, and is consequently the latest exploration in the northern direction.

Norfolk, Va., a port of entry, is situated in Norfolk County, on the Elizabeth River, 8 miles from Hampton Roads, in lat. 36° 51′ N., lon. 76° 19′ W. It is the most populous city in the State except Richmond, and has a larger foreign commerce than any other city in the State, and, together with Portsmouth (directly opposite), is the most important naval station in the United States. The harbor is large, safe, and easily accessible, admitting vessels of the largest size to the wharves. The entrance to the harbor is defended by Forts Monroe and Calhoun. The exports are principally cotton, oysters, fruits, and vegetables. Pop. about 25,000. See NAVY-YARD (GOSPORT), NORFOLK.

Norland. Of, or belonging to, the north land.

Norma. See CONSTELLATION.

Norman. A short, heavy iron pin inserted in the bitts to prevent the cable from flying off in rapid veering.

North (Ang.-Sax. *nord*). The initial point of the compass.

Northern Diver. The *Colymbus glacialis*, a large diving-bird.

Northern-glance. The old sea-name of the *Aurora borealis.*

Northern Lights. See AURORA BOREALIS.

Northers. Those winds so well known to all seamen who have frequented the West Indies, and which are preceded by the appearance of a vast quantity of fine cobwebs or gossamer in the atmosphere, which clings to all parts of a vessel's rigging, thus serving as a warning of an approaching gale. Northers alternate with the seasons in the Gulf of Mexico, the Florida Channel, Jamaica, Cuba, etc.

Northing. The distance in nautical miles which a ship makes to the northward; it is the difference of latitude in sailing north.

Norway Skiff. A particularly light and buoyant boat, which is both swift and safe in the worst weather.

Nose. A term often used to denote the stem of a ship.

Notch-block. A name for a snatch-block.

Nothing off! See HELM.

Nowel. The core of a heavy casting.

Nozzle. A term sometimes applied to the exhaust-pipe of a steam-engine, but more properly to the adjustable end of an exhaust-pipe

when led into the smoke-pipe to utilize the exhaust steam to increase draft.

Nuddee. A Hindoostanee word for a river.

Nuggar. A term in the East Indies for a fort, and also for an alligator.

Number. *Ship's number*, the number given on the paymaster's book to each person on board; it remains unchanged throughout the cruise. *Watch-numbers*, or *hammock-numbers*, are changed as a man's station is changed. In the signal-book each vessel is denoted by a special number, which the ship hoists on falling in with another vessel in the navy. *Your number is made*, a phrase signifying that the person addressed has been sent for. *To lose the number of the mess*, to die.

Numeral. *Numeral signal*, a hoist of signals, expressing numbers, and not requiring reference to the signal-book. It is distinguished by the *numeral pennant* over it.

Nun-buoy. See BUOY.

Nurse, or Wet-nurse. A name given to an experienced first lieutenant sent in the ship with an incompetent commanding officer. Thanks to our system of promotion by seniority, this state of affairs is never to be met with in our service.

Nutation. A gyratory motion of the earth's axis, producing a periodical fluctuation of the apparent obliquity of the ecliptic, and of the velocity of the regression of the equinoctial points.

O.

O. In the log-book, *o* denotes *overcast*.

Oakum. Junk untwisted and picked to pieces; it is used principally in calking seams. *White oakum* is made from untarred rope.

OAKUM-BOY. A calker's apprentice.

Oar. An oar consists of the *blade* and the *loom*. The blade is the flat part which is dipped in the water in rowing; the loom is the inboard part, the inner extremity of which is called the handle. *To toss oars*, to throw them up perpendicularly. *To boat the oars*, to lay them in their places in the boat. *Oars!* the order to lay on oars. *To lay on oars*, to cease pulling and keep the oars parallel with the water. *To feather an oar*, see FEATHER. *To trail oars*, to throw them out of the rowlocks and permit them to trail alongside.

OAR-LOCK. A rowlock (which see).

OAR-PROPELLER. A form of propeller which is made by machinery to imitate the action of an oar in sculling.

Oaths. An oath, in a legal or judicial sense, is a solemn asseveration, made in the presence of a magistrate or authorized officer, whereby an individual binds himself by the highest obligation to observe certain conditions, or to testify to certain facts which he knows of his own knowledge. It is usually accompanied by an appeal to a Supreme Being for the truth and sincerity of what is declared or affirmed. Men in military and naval service have from time immemorial been accustomed to take oaths of fidelity, which among the ancients were administered with much greater solemnity than now. Kennett, in his "Roman Antiquities," p. 188, describes the impressive manner in which a Roman legion was sworn, each man repeating the oath as he passed by, crying, "*Idem in me.*"

The statutes of the United States are specific in providing the text or substance of all oaths, and minute in prescribing by whom and at what time they are to be administered; and in courts-martial, courts of inquiry, etc., any deviation from the order laid down is held to invalidate the proceedings. Obviously, the least departure from the strict letter of the statute would be illegal, hence great care is enjoined. The peculiar form or ceremony of administering an oath, however, is subject to such variation as circumstances may render necessary in order to affect the conscience of him who swears. The multitude of religions, and consequent beliefs as to what is or is not binding, gives rise to many forms, and some exceedingly strange ones. For instance, in California, in 1870, one frequently heard of Chinese witnesses being sworn on the body of a recently killed chicken, and Capt. Hughes, in his learned treatise, tells of their being sworn in London by breaking a saucer at the moment.

As a general rule, in Christian countries, the right hand is placed on the Holy Bible, or New Testament, while the oath is being read, and the book is afterwards kissed. Those oaths which immediately concern the naval service are here presented. They differ in many respects and for the better from those in use in the army.

Of Allegiance or Office.—Every person elected or appointed to any office of honor or profit, either in the civil, military, or naval service, excepting the President, and those who participated in the late Rebellion, is required before entering upon the duties of such office, and before being entitled to any part of the salary or other emoluments thereof, to take and subscribe to the following (called the "ironclad") oath:

"I, A. B., do solemnly swear (or affirm) that I have never voluntarily borne arms against the United States since I have been a citizen thereof; that I have voluntarily given no aid, countenance, counsel, or encouragement to persons engaged in armed hostility thereto; that I have neither sought, nor accepted, nor attempted to exercise the functions of any office whatever, under any authority, or pretended authority, in hostility to the United States; that I have not yielded a voluntary support to any pretended government, authority, power, or constitution within the United States, hostile or inimical thereto. And I do further swear (or affirm)

that to the best of my knowledge and ability I will support and defend the Constitution of the United States against all enemies, foreign and domestic; that I will bear true faith and allegiance to the same; that I take this obligation freely, without any mental reservation or purpose of evasion, and that I will well and faithfully discharge the duties of the office on which I am about to enter, so help me God." (Revised Statutes, Section 1756.)

This oath may be taken before any person who is authorized either by the laws of the United States, or by the local municipal law, to administer oaths in the State, Territory, or district where such oath may be administered, and is by law required to be preserved among the files of the department to which it appertains. A less rigorous oath is provided for those who were engaged in the Rebellion, but are not rendered ineligible to office by the fourteenth amendment to the Constitution. The original oath of office, prescribed by act of June 1, 1789, was a marvel of brevity. It read: "I, A. B., do solemnly swear or affirm (as the case may be) that I will support the Constitution of the United States."

Of Enlistment.—A formal enlistment in the public service is incomplete without an oath. By law of July 11, 1798 (remodeled in Revised Statutes, Section 1609), the officers and men of the marine corps were required to take the same oath that was prescribed for the military establishment. That oath, enacted May 30, 1796, was for both officers and men, and has come down to us very slightly changed. It is still administered to the enlisted men, and reads:

"I, A. B., do solemnly swear (or affirm) that I will bear true faith and allegiance to the United States of America; that I will serve them honestly and faithfully against all their enemies whomsoever; and that I will obey the orders of the President of the United States, and the orders of the officers appointed over me, according to the Rules and Articles of War." (Revised Statutes, Section 1342.) In the enlistment papers of the marine corps there is added after articles, "for the government of the army and navy of the United States; and, further, that I am the full age of 21." The latter clause is intended to guard against the enlistment of minors, but is not always successful.

Army and marine officers now take the "iron-clad oath," and, in addition thereto, the former are obliged, "before entering on their duties," to subscribe to the Rules and Articles of War.

Prior to June 12, 1858, civil magistrates were employed to administer the oath of enlistment to recruits. In that year it was made lawful for a commissioned officer to do it, "*provided* a civil magistrate could not be obtained." And by act of August 3, 1861, this provision was removed, and any commissioned officer of the army or marine corps was authorized to perform the duty.

Of a General Court-martial.—When a general court-martial is ready to be sworn, the president of the court first administers the following oath, or affirmation, to the judge-advocate, or person officiating as such:

"I, A. B., do swear (or affirm) that I will keep a true record of the evidence given to, and the proceedings of, this court; that I will not divulge or by any means disclose the sentence of the court until it shall have been approved by the proper authority; and that I will not at any time divulge or disclose the vote or opinion of any particular member of the court, unless required so to do before a court of justice in due course of law."

The judge-advocate then administers simultaneously to all the members of the court, standing uncovered and ungloved as to their right hands, which touch the book (unless they elect to affirm), this oath:

"I, A. B., do solemnly swear (or affirm) that I will truly try, without prejudice or partiality, the case now depending, according to the evidence which shall come before the court, the rules for the government of the navy, and my own conscience; that I will not by any means divulge or disclose the sentence of the court until it shall have been approved by the proper authority; and that I will not at any time divulge or disclose the vote or opinion of any particular member of the court, unless required so to do before a court of justice in due course of law." (Revised Statutes, Section 1624.)

In practice, the judge-advocate usually puts the oath in the plural, and says, "You, A. B., C. D.," and so on, reciting the name and rank or title of each. Every member must be sworn or affirmed before proceeding to trial in each case.

Of Witness.—An oath in the following form must be administered by the president, or senior member, to all witnesses before general or summary courts-martial, and courts of inquiry, and retiring boards, when deemed necessary:

"You do solemnly swear (or affirm) that the evidence you shall give in the case now before this court shall be the truth, the whole truth, and nothing but the truth, and that you will state everything within your knowledge in relation to the charges, so help you God (or, 'this you do under the pains and penalties of perjury')."

Of Summary Court-martial.—Before proceeding to trial the members of a summary court-martial shall take the following oath, which shall be administered by the recorder:

"I, A. B., do swear (or affirm) that I will well and duly try, without prejudice or partiality, the case now depending, according to the evidence which shall be adduced, the laws for the government of the navy, and my own conscience." *After which* the recorder of the court takes the following oath, administered by the senior member: "I, A. B., do swear (or affirm) that I will keep a true record of the evidence which shall be given before this court and of the proceedings thereof."

It will be noticed that summary courts are not sworn to secrecy.

Of Court of Inquiry.—First, by judge-advocate to members: "You do swear (or affirm) well and truly to examine and inquire, according to the evidence, into the matter now before you, without partiality."

By president to judge-advocate: "You do swear (or affirm) truly to record the proceedings of this court, and the evidence to be given in the case in hearing." (Revised Statutes, Section 1624.)

Of Clerk or Reporter.—No form is fixed by statute, but the following is authorized to be administered by the judge-advocate:

"You, A. B., swear (or affirm) faithfully to perform the duty of clerk or reporter in aiding the judge-advocate to take down and record the proceedings of the court, either in short-hand or ordinary manuscript."

Of Interpreter.—No form by statute. Judge-advocate is authorized by regulations for administration of law and justice, U.S.N., 1870 (same as in foregoing), to use this form:

"You, A. B., swear faithfully and truly to interpret or translate in all cases in which you shall be required to do between the United States and the accused."

Oaths, Profane.—Such punishment as a court-martial may adjudge, may be inflicted on any person in the navy "who is guilty of profane swearing."—*Henry C. Cochrane, Captain U.S.M.C.*

Obi. A horrible sorcery practiced among the negroes in the West Indies, the threatened infliction of which is sufficient to lead the denounced victim to mental disease, despondency, and death.

Object-glass. The lens which first receives the rays of light.

Oblimation. The deposit of mud and silt by water.

Occident. The west.

Occultation (Lat. *occultatio*, a hiding). The hiding of a heavenly body by the intervention of some other one of the heavenly bodies. The commencement of the occultation is called the *immersion;* the termination of the occultation is called the *emersion.* The two most important cases of these phenomena are the *lunar occultations* and the *occultations of Jupiter's satellites.*

Oceans. By the term ocean we mean, primarily, the great mass of water that envelopes the globe. The same term is specifically applied to each of the great divisions of that mass of water, five in number. These are as follows:

1. Pacific. This is the largest of the five great oceans. It was first seen by Balboa in 1513, and by him made known to the Europeans. Magellan was the first to traverse it, in 1525, and it has since been explored by many navigators. It extends from the Arctic circle to 60° south latitude. Its width varies from 170 miles at the Kamskatka Sea to 10,000 at the equator, and it contains 77,000,000 square miles. The Northern Pacific contains few islands, and the eastern part of the whole ocean is bare of them; but the western half, and particularly the South Pacific, is full of chains and groups of islands,—volcanic or corallic, as well as many large island masses. Chains of islands and many large seas separate the Pacific and the Asian continent; but the American shore is steep and abrupt, with few indenting bays and inlets. The steady and regular currents and periodical winds favor navigation, and the absence of rough waters and stormy weather has given the name of Pacific to the ocean. But the islands in the south render navigation more dangerous, interrupt the winds and currents, and typhoons and cyclones are frequent in the western part of the ocean. The Pacific has a general wave motion from west to east at the rate of 28 miles a day. The northeast trades extend from 8° N. to 31° N., and the southeast trades from 9° N. to the Tropic of Cancer. The greatest ocean depth yet found was in the Pacific, 4655 fathoms, by Capt. Belknap, in the U. S. S. "Tuscarora." Little ice comes in at the north, but in the south, owing to less interruption from the land, ice-floes come farther north than in the Atlantic. The whale-fisheries of the Pacific are important, and other fish abound.

2. Atlantic Ocean. This is the second in size. It washes the east shores of America and the west coast of Europe and Africa. The Carthaginians were the first to navigate it, and the Northmen—about A.D. 1000—the first to cross it. It extends from 60° N. to 60° S. lat., and is from 930 to 4850 miles wide, comprising 31,000 square miles, but it has a more extended coast-line than all the other oceans, on account of its numerous inlets. It is the highway of ocean commerce, and possesses few dangers to navigation, and regular winds and currents. The Azores, Canaries, Cape Verdes, Bermudas, Madeiras, and a few single islands are found in mid-ocean, and these are out of the track of commerce to some extent. The northeast trade-winds extend from 2° to 27° N., blowing so regularly and evenly that the Spaniards named that part of the sea "Golfo de las Damas,"—"Ladies' Sea." The southeast trades blow between 1° N. and 40° S. Beyond these farther limits the variable winds blow, prevailing from the westward; the mighty Gulf Stream in the north and the southern connecting current in the south favor an easterly voyage. The calmness of the dividing latitudes between the northeast trades and the westerly winds is implied in its name,—"the horse latitudes," a tradition existing that a cargo of horses was thrown overboard in a calm there. So the strong westerly winds are typified in the name "roaring 40's" for those latitudes. In the calm latitudes, 20° to 30°, lie the masses of accumulated sea-weed called the "Mer Sargasso,"—*Weedy Sea.* Storms are frequent in the Northern Atlantic, being generally circular in character, and the "pamperos" of the south, and the "white squalls" of the African coast are enemies to the mariner. The existence of these regular winds and currents has led to a selection of routes between Europe and Asia, and now the steamer traffic is carried on in regular steam lanes. The northern passage follows a path between latitudes 52° to 45°; the middle, between latitudes 35° to 40°; and the southern, between latitudes 10° to 25°,—the latter only from Europe to America. The Atlantic varies in depth, but averages 2000 fathoms. On a plateau in the North Atlantic are laid the telegraph-cables, four in number.

3. Indian Ocean. This, the third in size of the great oceans, extends from the southern shores of Asia to 50° south latitude, and from Australia to Africa, containing 21,000,000 square miles. It contains several large islands, but they form slight impediments to navigation. The southeast trades exist from 20° to 30° south latitude, and beyond them the regular monsoons blow from the northeast from November to March, and from the southwest from April to September. The great masses of land surrounding this ocean are the modifying causes of these winds. Cyclones and typhoons attend the changes of the monsoons, and are at times severe. High seas and strong winds are frequent.

4. Antarctic Ocean. This name is given to the mass of water about the South Pole. It extends to latitude 60° S., and contains some 13,000,000 square miles. It was long considered frozen and impassable for ships, but Commodore Wilkes and

Sir James Ross, in 1841, penetrated into it, and discovered land. Ross ascended to 78° 04′, the highest point reached. A few islands exist, the South Orkneys and South Shetlands being the largest. The winds are strong, and blow in gales, often terrific, towards the equator, and the seas are often immense. But few vessels penetrate into these waters, and those only on fishing voyages.

5. Arctic Ocean. The mass of water about the other pole is called the Arctic Ocean. North of Europe it becomes the White Sea, and north of America the Frozen Ocean. It is the smallest ocean, containing some 7,000,000 square miles, and is partly filled by numerous islands, and the peninsula (or island) of Greenland. It has been the field of hardy exploration for centuries, and Capt. Hall penetrated as far as 82° 16′ north. New efforts are being made to traverse the seas and reach the pole. Ice is more abundant than in the South Sea. Whales, seals, and walrus abound, furnishing subsistence to the hardy inhabitants of the coasts, and making the fisheries important.

The principal phenomena connected with the ocean are its winds, currents, tides, its depth, saltness, temperature, density, and its animal life. The currents, winds, and tides are treated in separate articles. The depth of the ocean is now believed to average 2000 fathoms, or about 2 miles. The greatest depth found is 4655 fathoms, and no greater depth than 5000 fathoms is now believed to exist. Extensive plateaus, mountain ranges, sometimes cropping above the sea-level, and valleys exist. The temperature of the ocean varies with the latitude, but the isothermal lines vary with the currents that carry warm or cold water with them; 70° to 80° is the tropical temperature at the surface, and 50° to 60° the average. (See CURRENTS.) The water of the ocean holds in solution various salts, but the proportion varies with the locality. Near rivers the water is fresher, and in parts of the ocean where evaporation is rapid, it is very salt. With the amount of salt varies the density of the water. With the temperature both these vary, and animal life, now found to be everywhere in the ocean depths, also varies with the temperature, as well as with the depth, density, and saltness of the water. Animal life is far more abundant than on land.—*F. S. Bassett, Lieutenant U.S.N.*

Octans. See CONSTELLATION.

Octant. A reflecting instrument constructed on the same principle as a sextant. See SEXTANT.

Odessa, the most important seaport and commercial city of that part of Russia bordering on the Black Sea, is situated on the shore of that sea, between the mouths of the Dnieper and Dniester, in lat. 46° 28′ 54″ N., lon. 30° 44′ 30″ E. Since 1817, when Odessa was declared a free port, it has continued to make unexampled progress. The harbor affords good anchorage for ships, but they are exposed to the eastern and southeastern gales. Both the town and harbor are strongly fortified. Grain is the leading article of trade, which comprises tallow, hides, beef, butter, iron, copper, wool, etc. Pop. 190,000.

Oe. A violent whirlwind off the Ferroe Islands.

Oferlanders. Small vessels on the Rhine and the Meuse.

Off. Abreast of. The opposite of *near;* as, off the wind. *Standing off*, sailing directly away. *Standing off and on*, approaching the shore on one tack and receding from it on the other. *Off soundings*, in water so deep that bottom cannot be reached by the ordinary deep-sea line. *Off the reel*, see REEL.

Officer of the Deck. The officer who has charge, for the time being, of the management of the ship. On ordinary occasions, one of the watch-officers performs this duty, but, at quarters, it is assumed by the navigator, and when all hands are called, by the executive-officer. The officer of the deck represents the commanding officer, and his orders are obeyed and his position respected accordingly, though his authority is subject to that of the executive-officer. His duties are laid down in the navy regulations. See WATCH-OFFICER.

Officer of the Watch. See WATCH-OFFICER.

Offing. *In the offing*, well to seaward; beyond anchoring-ground. *To get a good offing*, to get well clear of the land.

Off-shore Wind. A wind blowing from the land.

Ogdensburgh is a port of entry, situated on the St. Lawrence River, in St. Lawrence County, N. Y., at the mouth of the Oswegatchie, in lat. 44° 41′ N., lon. 75° 31′ W. The prosperity of the place is principally derived from trade and extensive manufactures of flour, machinery, leather, etc. It has an immense grain-elevator, and about 10,000,000 bushels of grain pass through each year from the West to the New England States. Pop. 11,000.

Ogee. A molding with a concave and a convex outline like the letter S.

Ohm. The unit of electrical resistance; it is the resistance offered by a round wire of pure copper, 10′ long and .01″ in diameter, at 42° F.

Oil-butt. A name for the black-whale.

Oiler. A can for supplying oil to a journal.

Ojanco Snapper. A tropical fish of the *Mesoprion* family, frequenting the deep-water banks of the West Indies.

Oke. A Levant weight of 2¾ pounds, common in Mediterranean commerce.

Old Hand. A knowing and expert person.

Old Horse. Tough salt-beef.

Old Ice. In polar parlance, the ice of previous seasons.

Old Man. A sort of chute used in paying a chain-cable into a lighter. A common appellation for the master of a merchantman and the commanding officer of a man-of-war. *Old woman* is sometimes disrespectfully used to indicate the latter personage.

Old-stager. A person well initiated in anything.

OLD-STAGERISM. An adherence to established customs; sea conservatism.

Oldster. The opposite of *youngster*. It is somewhat difficult to draw the line between an oldster and a youngster, each person drawing it to suit himself.

Old Wife. A fish about 2 feet long, and 9 inches high in the back, having a small mouth, a large eye, a broad dorsal fin, and a blue body. Also, the brown long-tailed duck of Pennant.

Old Woman's Tooth. A peculiar chisel for stub-mortising.

Oleron Code. A celebrated collection of

maritime laws, compiled and promulgated at the island of Oleron, near the coast of Poitou, at or about the time of Richard I. This code was borrowed from the Rhodian laws and the Consolato, with alterations and additions adapted to the trade of Western Europe. It has served as the model for nearly all subsequent sea-laws, and has been admitted as authority on admiralty questions in the courts of this country.

Olick. The torsk or tusk, *Gadus callaris.*

Olpis. A classic term for one who, from a shore eminence, watched the course which shoals of fish took, and communicated the result to the fishers. See CONDER.

Ombre. A fish, more commonly called grayling, or *umber.*

On. *On a bow-line*, or *on the wind*, close to the wind with bow-lines hauled; close-hauled. *On board*, within a ship. *On end*, an-end. *On* is frequently and improperly used for *in*, or *on board;* as, *on* a ship. *On the beam*, in a direction at a right angle to the keel. *On the bow* (or *quarter*), in a direction forming an angle of less than 45° with the head (or stern) of the ship.

One-and-all. A mutinous sea-cry used in the Dutch wars. Also a rallying call to put the whole collective force on together.

Onerariæ. Ancient ships of burden, with both sails and oars.

Onion-fish. The *Cepola rubescens*, whose body peels into flakes like an onion. It is of a pale red color.

On-shore Wind. A wind blowing towards the land.

Oomiak. A light seal-skin Greenland boat, generally worked in fine weather by the women, but in bad weather by the men.

Opah. A large sea-fish (*Lampris guttatus*), called also *king-fish.* Its back is of a steel-blue color, its flanks of a rich green, and its abdomen of a rose color.

Open. Exposed to wind and sea. *To open fire*, to commence firing. *Open hawse*, see HAWSE. *Open ice*, fragments of ice, between which a ship may be forced. *Open order*, see NAVAL TACTICS.

Open-bill (*Anastomus*). A genus of birds of the Heron family (*Ardeidæ*). They are remarkable for the structure of the bill, the mandibles being in contact only at the base and tip, with a wide interval between their edges in the middle. They are natives of the East Indies and of Africa; one species is well known in India as the Coromandel Heron. They frequent the sea-coast and rivers and prey on fish and reptiles.

Ophiuchus (Gr. *Ophiouchus*, "The Serpent-bearer"). A constellation to the north of Scorpio, covering a space not very well supplied with bright stars. *α Ophiuchi*, Ras Alhague. *β Ophiuchi*, Cebalrai.

Oporto is situated on the Douro River, 2 miles from its mouth, in the province of Douro, Portugal, of which empire it was the capital until 1174, and it is now the second city in rank and commercial importance. It has extensive manufactures of silk, woolen, linen, and cotton goods, shawls, leather, etc., ship-building yards, and iron-foundries. The principal trade of the city is in port wine; other exports are bullion, oil, sumac, lemons, oranges, wool, etc. Lat. 41° 9′ N.; lon. 8° 37′ W. Pop. 90,000.

Opossum-shrimp. A crustacean, so named from its young being carried about in a sort of pouch for some little time after being hatched; the *Musis flexuosus* of naturalists.

Oppignoration. The pawning of part of the cargo to get money for the payment of the duty on the remainder.

Opposition. Two celestial bodies are in opposition when their longitudes differ 180°, especially when one of the bodies is the sun.

Oragious. An old term for stormy or tempestuous weather.

Oramby. A sort of state-barge in the Moluccas; some of them are rowed by 40, 80, or even, it is said, 100 paddles each.

Orariæ. Ancient coasting-vessels.

Orbis. A fish of a circular form (the *Chætodon orbis* of Gmelin) inhabiting the Indian seas. It is covered with a firm, hard skin, full of small prickles, but is destitute of scales. It is unfit for food; called also *orb-fish.*

Orbit. The imaginary line which a heavenly body describes by its proper motion.

Orc. Wrack, or sea-weed, used as manure on some of the coasts of England.

Orca. A classical name for a large voracious sea-animal, probably a grampus.

Order-book. A book kept for the purpose of copying such occasional successive orders as the admiral or senior officer may find it necessary to give.

Orderly. A private marine detailed as a messenger for the commanding officer.

Order of Battle. See NAVAL TACTICS.

Ordinary. Vessels are in *ordinary* when they are out of commission and laid up.

Ordinary Seaman. A rating next below that of seaman.

Ordnance. Gunpowder was not employed in Europe to throw projectiles until near the latter part of the 13th or the beginning of the 14th century.

Berthold Schwartz, of Freyburg, to whom, in the old German chronicles, is attributed the invention of gunpowder, but who was rather the disseminator of a knowledge of its ballistic properties, which he had discovered, was the first to employ it to project masses, such as were thrown by the ancient ballista, in mortars and bombards.

The first large bombards were short, resembling in form the modern mortar, and are said to have been made of wood strengthened by iron hoops, or of sheet-iron similarly reinforced with hoops sometimes brazed together. The later bombards, of greater size and strength, were formed of bars of iron arranged like the staves of a barrel and hooped with rings of wrought iron heated and shrunk on. Such were the great gun of Ghent and the Mons Meg of Scotland. The serpentine, of small calibre but of great length, was of similar construction.

Among the most remarkable of the ancient forms was the stone mortar, a truncated cone within and without, the smaller diameter corresponding to the breech, which terminated in a conical screw, by which it could be rigidly attached to a block of wood. All were strengthened by a swell at the muzzle and breech. They had neither trunnions nor handles. In 1427 the bombard was described by Redusius as of wrought iron, and consisting of a tube which, cylindrical in the rear, widened like a funnel towards the mouth.

The forward or widened part was 8 diameters of the ball in length, the rear part 16. The powder was placed in the latter, which was closed with a disk of wood, upon that, in the large part, the stone ball. The charge was ignited through a vent in the rear part.

In 1428 the English employed 15 breech-loading bombards at the siege of Orleans, arms of the preceding century. They were of lengths double or triple their diameters, and half bedded in a sort of wooden case, with which they were consolidated by bolts of iron resting on the tube, and traversing rings nailed to the upper face of the wooden case, their ends keyed. In loading, the movable chamber, filled with powder, was adjusted to the walls of the bore, a wad of hay pushed down from the muzzle, and after that the ball.

In 1439 the two parts composing the bombard, of iron or copper, were cast together or reunited on the same piece of oak. Towards the close of the 13th century iron balls came into use. In 1378 they were cast both solid and hollow at Augsburg, as were also bronze guns; and from that time guns approached their present forms, but were at first of such dimensions and weight as to be unwieldy.

The Turks had, in 1453, guns cast by Hungarian founders of 27-inch calibre, throwing stone balls of from 850 to 1200 pounds, which could be fired only four times in a day. The heaviest required to transport it 200 men and 70 yoke of oxen. One of them burst at the siege of Constantinople with destructive effect at the first discharge.

Such are the guns—Kemerlicks—seen by Von Moltke in the batteries of the Dardanelles in 1828, and by him described as gigantic guns, some 28 inches in diameter, into which a man might creep up to the breech. They lie on the ground on sleepers of oak, instead of gun-carriages, with their butts against strong walls so as to prevent recoil, as it would be impossible to run them forward again in action: some of them throw stone balls of 1570 pounds weight, with charges of more than a hundred-weight.

Bishop Pococke describes one of iron, "20 feet long, in two parts, after the old way of working cannon of iron in several pieces. The bore is 2 feet, so that a man may sit in it; 2½ quintals of powder are required to load it, and it carries a ball of 14 quintals."

The first foundries in Germany were not established until 1440. Up to that period only a few cities and wealthy princes possessed one or two large bombards.

In 1478, Louis XI. caused 12 guns—the Twelve Peers of France—of 45 pounds calibre to be cast; also a large bombard which threw an iron ball of 500 pounds weight, with a charge of 300 pounds of powder. By a premature discharge of this piece in the same year 14 persons, among them Jehan Mangué, its maker, were instantly killed; 15 or 16 wounded, several fatally; and a poulterer, tending his flock in a distant field, was killed by the ball.

In 1494, Charles VIII. invaded Italy. This prince, with an army of 20,000 men, had thirty-six 48-pounder bronze siege-guns, 8 feet long, weighing 6000 pounds; 104 field-pieces,—culverins, falcons, and falconettes, with other guns of less calibre, but of greater comparative length, all on wheel-carriages drawn by horses. "With these guns were made more discharges in a few hours than had before been made in several days."

In the reign of Francis I. progress was made in the improvement of ordnance. From that time efforts were made to fix thickness and calibre of guns, to improve powder, to establish proper charges, and to adopt improved processes in the foundries.

In 1521, Charles V. caused experiments to be made at Brussels to determine the most advantageous length of guns; the pieces, 48-, 36-, and 24-pounders, were cast of extra length, with five muzzle swells at which they were successively cut off. The greatest ranges were given by 18, 20, and 22 calibres respectively; a length of 18 calibres was adopted for all.

In 1535 he had 12 guns of new proportions cast at Malaga,—the Twelve Apostles,—40-pounders. These pieces long served as models for cannon-founders in Europe. They had a reinforce at the chamber; length of bore, 18 calibres; length of reinforce, 8 calibres; the thickness in $\frac{1}{8}$ of a calibre, 7, 5, 3, at the chamber, trunnions, and neck; weight of the gun, 6300 pounds, and of the charge, 20 pounds. Improvements continued to be made in France until towards 1550, when civil war interrupted progress until the end of that century.

In 1547 *cast-iron* guns are said to have been in general use in England.

In 1572, Charles IX. suppressed the great variety of calibres then in use under various names, substituting seven,—from the 42-pounder of 9200 pounds weight, 11 feet long (double cannon), to the ½- and ¾-pounders of from 200 to 400 pounds weight, 6½ feet long (falconet).

About the middle of the 16th century many guns exploded with fatal effect, and among other causes assigned by Fronsperger, in 1555, was the use of fine-grained powder instead of the large common powder.

In 1540 large-grain powder was preferred to fine for large calibres.

In 1546, according to Tartaglia, cannon-powder was not grained, but musket-powder was.

The compositions most used were—

For Large Calibres.		Medium.	Small-Arms.
Nitre	50	66.7	83.4
Sulphur	33.3	20	8.3
Carbon	16.7	13.3	8.3

In 1593, as given by Vignère, the composition of French war powder was as follows:

	For Cannon.	Arquebuse.
Nitre	75.68	71.43
Sulphur	10.81	14.285
Carbon	13.51	14.285

The cannon-powder was in grains of the size of small hazel-nuts.

In 1606, St. Julian, in his "Forge of Vulcan," published in Holland, says, "With large cannon-powder the charges are one-half, sometimes three-fourths, of the weight of the ball. But when the use of musket-powder began the charges were reduced to less than half."

He thought that effort should be limited to improving the quality of powder while preserving its grain, and that the wad of hay placed on it should be as large as possible.

From this it appears that while on the one

hand it was sought to reduce the initial pressure of the gases in large guns by adjustment of proportions of the components of powder, on the other, the better means—air-space and large-grain powder—had at that early day its advocates.

In Italy, about 1597, cannon, properly so called, shorter than the culverins, having been suppressed, only culverins of 14 and 30 pounds calibre were cast.

In the same year Savorgano, who had previously cast for the galleys guns 36 calibres in length, $\frac{1}{4}$ of a calibre thick at the breech, invented a new breech-loader, its calibre that of the sacre,—12-pounder,—but having greater range than the *petriera a braga*. The piece was closed from the side of the breech by a bronze wedge which traversed it. The ball was attached to the cartridge. The *petriera a braga* was invented by Beccalua; some of 12, others of 14 pounds calibre, their weight 62 times that of the shot. The chamber movable. A thick wad was placed in the piece, then the ball, and after that the charged chamber secured by an iron wedge attached to the carriage, the forward end of which rested upon two supports.

In 1605, Henry IV. had 50 pieces—45-pounders—all alike. Sully, Grand Master of Ordnance, said such a park had never been seen before. The 60-pounder was suppressed as too difficult to transport, and rendering no better service than the 40-pounder. All guns were richly chased. In 1609, in Spain, the calibres were reduced to four, 40-, 24-, 10-, and 5-pounders; lengths, 19, 24, 29 calibres; ratios of weight of gun to shot, 180, 235, 380. Some time before this there had been added to the culverins then in use in these states battering guns of the calibres 96-, 48-, 24-, 12-, and 6-pounders; lengths, 17, 18, 20, 24, 29 calibres. To these guns the modern French 24- and 12-pounders owe their origin.

Iron guns are said to have been cast at Erfurt in 1377, in Silesia in 1440, in England in 1547, in Hartz in 1626, and in Prussia in 1667. Nearly all the earlier writers considered cast-iron guns as less strong than bronze, but no mention is made of explosions. As the windage was large, the mode of charging such as gives low pressures, and the powder less violent, accidents were probably rare.

In 1626, Gustavus Adolphus employed the so-called leather guns, invented by Col. Wurmbrand. The cylinder of bore, of copper, 15 calibres in length, an eighth of a calibre in thickness, lightly reinforced about the seat of the charge; the vent-tube of iron, screwed to the cylinder of the bore. The bottom of the bore was formed by the face of a bronze breech 1 calibre in length, with a button, and fixed to the copper cylinder by 6 screws. Strong rings of iron added to the solidity of the cylinder around the charge. At the forward extremity the copper was rolled on itself to form a muzzle swell. The cylinder, coated with several layers of mastic, was wrapped with rope and twine, giving a thickness of 1 calibre to the first reinforce, and $\frac{3}{4}$ to the chase, which served not only to strengthen it, but to secure the trunnions. Over this was placed a coat of plaster, giving an even surface. The whole was then covered with leather.

In 1631 these guns were discarded, for, in consequence of the non-conductivity of the enveloping material, they became so hot at the battle of Leipsic as to ignite their charges. The charge being limited to one-quarter the weight of the ball, their range was short.

In 1640 large gun-foundries were established in Sweden.

The word "mortar," or "mortier," appears to have been first applied to pieces employed by the Turks at the siege of Belgrade, in 1456. They had also, at the siege of Rhodes, in 1522, 12 bronze mortars throwing copper bombs, consisting of two hemispheres inclosing inflammable matter and small hollow balls which burst (grenades). Mention is made of bombs larger than hand-grenades at the bombardment of Arles, in 1536.

Bombs 11 and 19 inches in diameter, with fuzes which screwed into the eye, were employed at the siege of Boulogne, in 1542.

In 1606, according to St. Julian, mortars were of the calibres 6, 12, and 18 inches. They had trunnions at the middle of their lengths, without rim-bases or reinforces; the charge, 1 pound of powder for each 30 pounds of the weight of the bomb. The chambers of some were cylindrical, of others concave, spherical, or pear-shaped: some of the latter in the 12-inch containing 18 pounds of powder. The bombs of the 18-inch weighed, empty, 490 pounds; filled, 538 pounds.

Knowledge of the bomb and of mortar-firing was introduced from Holland into France by Malthus in 1634.

In 1637 fatal accidents occurred in igniting the fuzes of bombs in mortars prior to discharge. In 1638 it was observed at Versailles that the fuze could be ignited by the flame of the charge, but it was not until 1751, when Le Duc had shown by extended experiments the certainty of ignition, that the method was changed.

The small mortar introduced into France by Coehorn in 1679, and to which his name was given, was invented by Holts in 1668.

In 1691 the 18-inch bomb was named by Louis XIV. "Comminges," after an officer of remarkable girth. In 1697 they were employed at the siege of Ath. In 1733, at the siege of Trarbach. In 1745, producing little effect at the siege of Tournay, and being difficult to transport, they were discarded.

The partridge mortar (*mortier à grenade*) was invented by Petri in 1693. In addition to the ordinary bomb, it projected 13 grenades from as many barrels disposed circularly around an 8-inch mortar, which weighed 205 pounds,—the total weight 241 pounds; charge of the 8-inch, $\frac{1}{2}$ pound; of the others, proportionally less. It was introduced in France in 1700.

Machinery for boring cannon, invented in Switzerland by Lew, was introduced into France by the founder Maritz, who cast the first solid gun in 1713. Until 1721 service guns were cast hollow. In that year, the brothers Keller invented a vertical borer which cut out the cylinder of the bore in a single piece.

In 1744–45, Maritz suppressed hollow casting at Strasbourg and Douai, establishing horizontal boring machinery, and in 1755, as general inspector of foundries, applied the same process to iron guns, employing only the softest iron. In the same year solid casting for bronze guns was adopted in Holland and Prussia. In hollow casting it was difficult, with the imperfect means

then in use, to maintain the core in position. Cavities formed in the metal about it, and scoria did not rise freely. Especially was this the case with the very soft iron employed by Maritz, who obtained more nearly perfect forms by casting solid. The iron guns cast by Maritz were deficient in strength; many failed to resist proof, and others burst on board ship. In consequence, the control of foundries of naval guns was transferred to the navy department, with some advantage; but in 1779 it was found necessary to increase the thickness of metal.

Montalembert, who preferred solid to hollow casting, had pointed out, in 1764, the inferiority of the soft, spongy iron employed by Maritz, and explaining the effect of sudden cooling in rendering iron brittle, indicated the course to be pursued in the construction of stronger guns of harder and more tenacious iron. The views of Montalembert were in advance of his time, and were neglected.

In 1732 the system of De Vallière was adopted. Guns, 24-, 16-, 12-, 8-, and 4-pounders; mortars, 12- and 8-inch; stone mortars of 15-inch, and howitzers of 8-inch; the bottom of the bore of guns rounded out $\frac{1}{4}$ calibre; small chambers at the bottom of the bore were retained only in 24- and 16-pounder guns.

The windage and thickness of the metal were proportional to the diameter of the ball; thickness at breech, 1 diameter; at the beginning and end of the first reinforce, $\frac{24}{24}$ and $\frac{22}{24}$; of the second reinforce, $\frac{20}{24}$ and $\frac{19}{24}$; at the commencement of the chase, $\frac{17}{24}$, and at the astragal of the neck, $\frac{11}{24}$; and finally, $\frac{16}{24}$ at the swell of the muzzle.

The dimensions of the moldings were expressed in terms of the diameter of the bore divided into 36 parts. The length of the cascabel, its neck, the bottom of the breech, and the projection and size of the trunnions, the axis of which was tangent to the lower surface of the bore, were not altered. The length of the two reinforces and chase preserved their relation to that of the piece; the sight and pointing-button were suppressed. The 8-inch mortar was for short ranges. The 12-inch were of three kinds, one having cylindrical chambers containing $5\frac{1}{2}$ pounds powder.

Two of the new guns cast at Lyons, and proved by De Vallière, were discharged 1500 times in quick succession, with charges of one-third and one-half the weight of the ball, without injury to the chase or bore,—the vent of one scarcely widening at all, that of the other a little. The vents were in a piece of pure copper, which was placed in the mold before casting. De Vallière designed the screw bouche, which was found to answer the purpose, but was not then adopted. Until 1739 the charges of guns had been two-thirds the weight of the ball. In that year Belidor determined, by experiment at La Fère, that a charge of about one-third was sufficient for all calibres. The French service charges were therefore reduced to that ratio.

The first of De Vallière's howitzers was cast at Douai, in 1749. The bore 3 diameters in length, the chamber cylindrical, 7 inches long, and 3 inches in diameter. The first howitzers *used* in France were taken from the allies at the battle of Nerwinden, in 1693. In 1741, the king of Prussia having introduced very light iron guns into field service, the French attached to each battalion a Swedish 4-pounder, $4\frac{1}{2}$ feet long, of about 600 pounds weight, which could be fired with ease ten times in a minute.

But the weight of the heavier guns of the model of 1732, forming the heavy artillery, prevented full advantage being taken of the lightness of these pieces for extended movements. Austria and other powers lightened their heavy artillery, and in 1756 the French, as proposed by De Broglie, bored up their 12-pounders and 8-pounders to 16-pounders and 12-pounders. The guns were then, however, deficient in strength and badly proportioned.

Experiments at Strasbourg, in 1764, preparatory to the improvements proposed by Gribeauval, showed that 12-, 8-, and 4-pounders, reduced in length to 18 calibres, the ratio of weight of gun to that of ball being 150, had the required range and sufficient mass. It was decreed in 1769 that there should be two classes of guns; the first, 24-, 16-, 12-, and 8-pounders, for the attack and defense of fortresses; the second, of 12-, 8-, and 4-pounders, for field service, a 1-pounder for light troops. The old 8-inch mortar, a new 10-inch with cylindrical chamber, and the stone mortar were retained. The 8-inch howitzer appropriated to siege purposes, the 6-inch to field service. A few slight alterations were made in siege and garrison pieces of the models of 1732. The length of the second reinforce was increased, to include the rim-bases added to the trunnions; the handles received a more simple form, many moldings and ornaments were suppressed, as well as the small chamber at the bottom of the bore. The sights and buttons were preserved. The centre of gravity and the trunnions were thrown a little more towards the breech.

Field-pieces were 18 diameters of the ball in length. The diameter of the ball was subsequently increased to diminish the windage. Siege- and garrison-guns were proved by 4 discharges, 2 of one-third and 2 of two-thirds the weight of the ball. All to be cast solid. The stone mortars were cast hollow. Elevating screws replaced the quoin. These changes excited much discussion, but experiments at Douai in 1772 and 1785 established their propriety.

In 1789 the Gomer mortar was adopted,—chamber a truncated cone. The trunnions, their axis intersecting the middle of the chamber, were reinforced. There were three calibres,—12-inch, 10-inch, and 8-inch,—their profiles similar.

The calibres of cast-iron guns for coast defense were determined in 1790: 36-, 24-, 16-, and 12-pounders; mortars 12-inch and 10-inch, with chambers in the form of a truncated cone, containing 11 pounds of powder.

Notwithstanding the advantages of Gribeauval's system, it was apparent that it could be rendered still more simple. Steps were being taken to perfect it when, in the year XI (1803), a decree overturning the whole system of artillery substituted ill-considered innovations. By this decree all guns were to be cast without reinforces or moldings, in the form of a truncated cone from the breech-ring to the tulip.

To avoid the complication arising from the multiplicity of calibres, in the campaigns of 1808 and 1814, guns of Gribeauval's system, exclusively, were supplied to the armies in Spain and Portugal, whilst the 6-pounder, adopted by the

decree of 1803, was supplied to the other armies, thus practically returning to the system of Gribeauval, which was gradually perfected in matters of detail.

In 1804 there were cast at Douai four 11-inch bronze howitzers (*canons-obusiers*), proposed by Col. Villantroys, and subsequently two others of the same calibre. Length of bore 8 calibres. These guns gave ranges of 2400 toises (5117 yards) and upwards. One of similar character, designed by Gen. Ruty, cast at Seville in 1811, gave, with charge of 33 pounds and a bomb filled with lead, weighing 181 pounds, a range of 2790 toises (5948 yards). One of iron, Villantroys's, cast at Liege in 1813, length of bore 8 calibres, weighing 8491 kilogrammes, with a charge of from 30 to 60 pounds, and a bomb of 180 pounds, sabot of 13 pounds, gave a range of 2671 toises (5694 yards).

Bronze guns were in general use in England in 1768, when John Muller urged, on the ground of lightness and economy, the substitution of cast-iron guns, referring, in illustration, to the armament of the "Royal George," consisting of 100 bronze guns, weighing 218.2 tons, costing £28,366. The same number and calibre of his model would weigh 127.8 tons, and cost £2044.

This and other propositions were favorably received, and the expenses reduced. When the "Royal George" sank at Spithead, in 1782, the bronze 42-pounders on the lower deck had been replaced by iron 32-pounders, but she still had bronze 24-pounders on main-deck, quarter-deck, and poop, and bronze 30-pounders on the middle-deck. The carronade, 12-pounder to 68-pounder, invented by Gen. Melville, and first cast at the Carron Works, of which Gascoigne was the manager, was adopted as a navy gun in June, 1779,—10 to each ship, from first-rate to sloop.

Sir William Congreve is said to have been the first to propose diminishing the quantity of metal about the chase, and to increase that about the seat of the charge. The profile of the 24-pounder Congreve gun of 41 hundred-weight, 7 feet 6 inches long, is, from base-ring to muzzle-astragal, nearly a straight line, interrupted by two flat rings, one at the front of the vent-field, the other just forward of the trunnions; the axis of the latter tangent to the lower surface of the bore. The angle of dispart, 5°; ratio of weight of gun to shot, 180; length of bore in calibres, 14.5; thickness at base-ring, 1.5; at neck of chase, .5.

In 1814 experiments of comparison were made at Sutton Heath with the Congreve and Blomefield 24-pounder guns, the latter longer and heavier than the Congreve gun, and an ordinary long 24-pounder. In these experiments the guns, being pointed by the line of metal, the extraordinary dispart of the Congreve gun gave correspondingly extraordinary ranges, attributed at the time to the weight of metal at the breech rather than to its form. But, in 1815, Olynthus Gregory subjected three 6-pounders of the new models to test with the ballistic pendulum. The initial velocities were greatest for the common, and least for the Congreve gun. Comparison of the Congreve and ordinary long 24-pounder was also made with the same result.

Monk, in 1838, and Millar subsequently in his shell-gun, suppressed the ring immediately in front of the trunnions of the ordinary gun, connecting the second reinforce with the chase, and the base-ring with the first reinforce, by concave curves.

Of Monk's 32-pounders, 4279 were proved without a failure. In these guns was a nearer approach to a distribution of metal proportional to the pressure at points along the bore than had before been made.

In the guns modeled according to the construction proposed by Commodore Wadsworth, of the U. S. navy, in 1845, all rings, excepting the muzzle- and base-rings, were suppressed, and the profile approaches that of the Dahlgren gun, in which the lines are unbroken.

French ship-batteries.—In 1812 the calibres were 36-, 24-, 18-, and 12-pounder cannon and carronades. In 1829 the 30-pounder, of various weights, was adopted for all batteries. In 1837 the 80-pounder Paixhan gun was assigned a place. The decree of 1848 increased the number of 22-centimetre shell-guns, and that of 1849 introduced 50-pounder cannon as a substitute for some of the former; it also suppressed the carronade.

English ship-batteries.—Previously to the war of 1812 the long 32-pounder predominated as the principal piece for the heaviest ships, and in frigates the long 18-pounder. In 1839 the 32-pounder, six classes of different weights, was adopted. With these were combined 8-inch shell-guns of 65 and 53 hundred-weight. In 1848 more than 8000 new and reamed 32-pounders were available, and about 1600 shell-guns. The 10-inch shell-gun of 84 hundred-weight, and the 68-pounder of 95 hundred-weight, were adopted as pivot-guns.

United States ship-batteries.—The new ships built after the war of 1812 were armed as follows: Frigates, gun-deck, 32-pounders; spar-deck, 42-pounders. Liners, lower-deck, 42-pounders; gun-deck, 32-pounders; spar-deck, 42-pounders. In 1841 a few 8-inch shell-guns (63 hundred-weight) were introduced. In 1845 the 32-pounder was adopted as unit-calibre,—six classes, weighing severally, 56 hundred-weight, 51 hundred-weight, 46 hundred-weight, 42 hundred-weight, 32 hundred-weight, and 27 hundred-weight; the shell-guns of 63 hundred-weight and 55 hundred-weight being almost identically the English system. In 1853 it was directed that ten 8-inch shell-guns of 63 hundred-weight should form an entire division on the gun-decks of liners and frigates. None on the spar-deck.

The *columbiad*, a heavy gun combining the qualities of the gun, howitzer, and mortar, was invented by Col. Bomford, and used in the war of 1812.

In July, 1841, experiments proposed by Col. Bomford to determine the expansive force of powder in a gun by firing pistol-balls through its sides, were made at Watertown Arsenal. Lateral tubes were inserted at intervals of 2 calibres. The balls were fired vertically into a series of pine boards half an inch thick, and seven-eighths inch apart. The number of boards penetrated gave the force exerted. This method was improved by Major W. Wade, the bullets being discharged horizontally into a small pendulum. The gun was bored through the breech and fitted with a movable plug, in order to vary at will the distance of the fixed barrels from the bottom of the bore.

In 1843 the results were reported to Col. Talcott.

Distance of Barrel from centre of Ball, in calibres.	Relative Velocities.
In rear, 1	1.0000
At the centre, 0	.9758
In front, 1	.8149
" 2	.6767
" 3	.6135
" 5	.5291
" 7	.4393
" 9	.3988
" 11	.3667
" 15	.2858

In 1844 a 10-inch columbiad and an 8-inch columbiad of new model were tested. The 8-inch burst at the 729th fire; the 10-inch at the 600th fire with service charges.

In 1849 two 8-inch columbiads were cast at the Fort Pitt Works,—one solid, the other according to the plan invented by Lieut. Rodman, on a hollow core through which a stream of water passed while the metal was cooling. The solid cast burst at the 85th, and the hollow at the 21st fire; service charges, 14 pounds.

In May, 1850, Lieut. John A. Dahlgren, of the navy, proposed to the Navy Department the construction of a gun in accordance with a design which he furnished. In 1852 the first gun of this design was constructed by the United States. The proportions, in calibres, are as follows:

Length of fort	2.389
" junction	2.778
" chase	6.833
Length of bore	12.000
" breech	1.511
From face of muzzle to end of breech	13.511
Diameter at commencement of fort	3.022
At division-line between junction and chase	2.036
At muzzle	1.400

From a point .35 of a calibre forward of the fort, the profile of the gun, for a distance of 2.28 calibres, corresponds with a line drawn with the aid of a draughtsman's batten through the extremities of ordinates representing the pressures determined by Wade at corresponding distances in calibres from that point, the maximum pressures corresponding to maximum *thickness*. This embraces the *junction*. Thence, from a point 4.39 calibres from the bottom of the bore, the profile approaches the axis, until, at the distance of 5.61 calibres, the difference between it and the pressure-curve is 0.1 calibre; after which it continues nearly parallel to the curve of pressures.

At the commencement of swell of muzzle—the thinnest part of the gun—the difference is 0.2 calibre.

It appears that the Dahlgren gun presents the first practical application of results obtained by experimental determinations of pressure at different points along the bore, by such methods as were proposed by Col. Bomford,—that is, by boring holes in the walls of the gun, through which the pressure acts upon other bodies, such as pistol-balls, pistons, etc.

This, with the hemispherical breech and suppression of all rings, gives the gun that symmetrical appearance which is its characteristic feature.

The proving and testing of the Dahlgren shell-gun was continued during the years 1852–54.

The first 11-inch shell-gun was fired 500 times with shells, and 655 times with shot weighing 170 pounds, without bursting, which occurred at the 1959th round; the service charge, 15 pounds.

In 1853 the endurance of navy guns of different classes was tested at Old Point Comfort by Commander D. G. Farragut. Two shell-guns exhibited remarkable powers of resistance. A 10-inch of 88 hundred-weight, cast in 1848, fired 275 rounds, 1 shell of 104 pounds, 10 pounds powder; 28 rounds, 2 shells of 103 pounds, 8 pounds powder; 8 sets of firings of 5 rounds each, with solid shot of 130 pounds weight, and an additional shot for each set after the first; the last set with 8 shot, charge, 14 pounds of powder throughout; followed by 52 rounds with 8 shot and 18 pounds of powder; 11 rounds with 8 shot and 20 pounds of powder; a slight increase of the bore over the seat of the shot, and the wear of the vent being the only evidence of injury.

The 8-inch of 55 hundred-weight, cast in 1845, with proportional charges, gave equally favorable results.

It appears from this that the service charge of the 10-inch, 10 pounds, might have been made more nearly commensurate with the calibre of the gun.

In 1851, to test still further the Rodman plan, two pairs of 8-inch and 10-inch columbiads were cast, one of each pair solid, and the other hollow and cooled as before.

The 8-inch solid burst at 73 fires.

The 8-inch hollow burst at 1500 fires.

The 10-inch solid burst at 20 fires.

The 10-inch hollow burst at 249 fires.

In 1856 two 10-inch columbiads, one hollow, the other solid, were tested. The solid cast burst at the 26th fire, the hollow at the 31st fire.

In January, 1857, Rodman recommended, "as the requisite knowledge to manufacture guns of those calibres which can be relied upon for any given number of fires is not possessed, that the casting of service columbiads be discontinued for the present."

In 1857 three 10-inch columbiads, 2 solid and 1 hollow cast, were tested. The 2 solid cast burst at the 169th and 399th fires respectively. The hollow cast was unbroken after 1600 rounds.

In 1858 two 10-inch columbiads, one solid, the other hollow cast, withstood 2396 rounds each with service charges; 54 rounds with charges of from 15 to 18 pounds; 2450 rounds, exclusive of proof charges. Subsequently they were each fired 1632 rounds with 18 pounds of powder and a solid shot, making a total of 4082 service and 2 proof charges for each gun. Neither gun broken; the solid most worn.

The guns of 1857 were of the old columbiad model modified to the extent of the removal of the base-ring and swell of the muzzle; while those of 1858 were of a new model without chambers or ratchets in the breech, and with increased thickness of metal in the breech, being over 1½ calibres thick at that part. The cascabels, with slender necks, dropped from the guns in the course of the firing. The profile was unchanged, with the exception of that due to substitution of a cascabel for the ratchet.

In 1857–58, at Alleghany Arsenal, Rodman first applied the pressure-gauge (piston and indenting tool) to determine the pressure of gas in the bore of a 42-pounder, at the bottom of the bore and at intervals of 2 calibres. This

method he had suggested to Major Wade as early as 1851.

In May, 1860, was completed the first 15-inch gun cast and cooled upon the Rodman plan. The form was determined on the hypothesis that "the pressure is inversely as the square root of the space behind the shot. The expression for the tangential resistance which enters the formula for the bursting tendency, was derived from the hypothesis that, in this resistance, the strain developed by the action of a central force in the concentric elementary cylinders, of which we may suppose the gun to consist, diminishes as the square of the distance from the axis increases." Experiment indicated that it would be unsafe to assume the strain to diminish in a less ratio. As the compressibility of the metal prevents the full development of both the transverse and tangential resistance, only one-third of the theoretical transverse resistance was used in computing the exterior radii of the 15-inch gun. The gun was purposely made somewhat heavier in the chase than the hypothesis that the pressure is inversely as $\sqrt{L}$ would give it, with a view to the employment of charges producing more uniform pressure, and consequently greater pressures in the chase of the gun, for a given maximum pressure, than is obtained by the use of ordinary powder.

Rodman recommends that the beginning of the taper should be about half a calibre forward of that part in which occurs the most rapid diminution which the law of pressure would give it. The exterior form and proportions of the gun, as cast, are similar to those of the Dahlgren gun. The trials with the gun were very satisfactory, and simultaneously with this result was demonstrated the superiority of Rodman's perforated cake and very large-grained powder for guns of great calibre.

Rifled Cannon.—Robins, whose "New Principles of Gunnery" was published in 1742, recognized the superiority of the rifle to the smoothbore, and his prediction of advantage to the state which should first adopt it has been verified.

In 1774, Dr. Linn and Capt. Alexander Blair, of the 69th Regiment of Foot, invented a species of rifled field-pieces of cast iron, of 1 or 2 pounds calibre, the grooves—6 in number, of semicircular section, $\frac{1}{30}$ calibre in depth—making one turn in the length of the bore, 22 calibres, and cast upon the core, were, at 2 calibres from the bottom of the bore, of full depth, diminishing and ending at $1\frac{1}{2}$ calibres from the bottom. Bullets, of lead with 6 buttons cast on them to fit the grooves. These rifles had telescopic sights with cross-hairs and graduated sectors, and were mounted on carriages. It was then asserted that "rifled ordnance of any calibre might be made to carry iron shot for battering or for other purposes, provided holes that are a little wider at their bottom than at their upper parts be cast in a zone round the ball for receiving afterwards leaden knobs (studs), to fit the rifles of the cannon."

Under Napoleon III., and in the light of what had been done by Wahrendorf, Cavalli, and others, rifled field-pieces were constructed in France in 1854 which, with improvements suggested by experience in Algeria and Cochin China, were employed with great effect in the Italian campaign in 1856.

In 1858 the light Armstrong gun was adopted for field service in England. And in 1859 the Armstrong system, breech-loading and welded coil, was completely adopted by the government —40-, 70-, and 110-pounders—for the navy.

The failure of these guns as breech-loaders led to the substitution of muzzle-loaders.

About the same time the Russians substituted Krupp's breech-loaders for his muzzle-loaders.

Breech-loaders.—In the infancy of ordnance there were many breech-loading bombards, some of large calibre; but with the increased tension to which the employment of iron projectiles gave rise, the mechanical devices of that day were insufficient to resist the pressure, or to prevent leakage of the gas, and the consequent wearing away and final yielding of the fermature. And although in more recent times attempts were made to accomplish so desirable an improvement, they met, as in the case of Montalembert's wall-piece, with but partial success. It was not until after 1843 that the forms devised by Wahrendorf and Cavalli were developed. Nor, until they were united and combined with the Broadwell gas-check (the principle of action of which under fluid-pressure had been illustrated by Bramah in his invention,—the *cupped leather collar* of the hydraulic press), was it known that a properly constructed breech-loader is stronger than a muzzle-loader of the same calibre with a solid breech.

Built-up Guns.—Since the circumferential tension or hoop-tension in a hollow cylinder is not uniformly distributed when the thickness is great as compared with the radius, constructors of guns have endeavored by special dispositions of parts in connection with different physical properties of cast iron, wrought iron, steel, etc., to distribute the tension more uniformly. First, by subjecting the interior tube or tubes to compression under the permanent tension of encircling hoops shrunk or forced on by pressure; or by the employment for the inner tubes of that metal which within its elastic limit stretches most.

The systems of "initial tension" and of "varying elasticity," as they are called, are employed separately or together.

In reinforcing cast-iron guns by rings shrunk upon them, Capt. Blakely employed the system of initial tension, and in the Blakely gun combined with it that of varying elasticity; the inner tube of low steel, the next of high steel, over which an outer cast-iron jacket, to which the trunnions were attached, was placed with sufficient tension to make contact.

The Parrott gun is, in the words of its inventor, "a hooped gun of the simplest kind, composed of one piece of cast and one of wrought iron. It has no taper, no screw, no successive layers of hoops."

Parrott guns of various calibres were much used during the war 1861–65. The 30-pounder and smaller calibres exhibited remarkable endurance.

The 100-pounder was regarded with some distrust, several exploding during the war. They had good range, were accurate, and were highly prized by the Confederates when they chanced to fall into their hands.

The Brooke guns, rifled, were of cast iron reinforced, during the first part of the war, by a single series of bands, each 2 by 6 inches, extending

from the breech to near the trunnions. Subsequently, the thickness of cast iron was reduced, the cylinder of the gun extended to just beyond the trunnions, and a second series of bands was shrunk upon the first, breaking joints. The trunnions and sight-masses were united with the gun by curves. There were 3 calibres: 6.4-inch, 7-inch, and 8-inch. The 7-inch and 8-inch were chambered; form, frustrum of cone with hemispherical bottom. The bottom of the bore of the 6.4-inch terminated in a hemisphere. There were also three 7-inch rifles, of extra length, cast without trunnions, and reinforced by three series of 6 by 2 inches wrought-iron bands. The trunnions were forged with their band in one piece or cast in bronze. The trunnion-band was slipped on loosely, the shock of recoil being transferred by a heavy wrought-iron breech-strap to the trunnions and carriage.

Several 10-inch and 11-inch guns, cast with trunnions, but of extra length, were reinforced by two and three series of bands, respectively, in rear of the trunnions, but were not rifled. Spherical projectiles of steel, tempered in oil, were made abroad for them, with which large charges of powder were to be used.

Repeated attempts have been made to forge large wrought-iron guns of bars, disks, or rings welded into a single piece, capable of withstanding modern charges, but without success. It is impossible to detect faults of welding in such large masses, and no confidence can be placed in guns so made even after proof. A heavy wrought-iron gun, forged in 1843, burst on board the U. S. S. "Princeton" with fatal effect.

Sir William Armstrong, who, in 1854, proposed to construct rifle-cannon for the English government, succeeded in forming tubes, or pipes, or cylinders, by coiling spirally long bars of iron into tubes, and welding them upon the edges, as is done in gun-barrels. Of these he composed guns of great strength. Three such tubes united by welding the joints were sufficient for a 25-pounder gun. The welded coils were shrunk upon a steel tube. Subsequently, the inner tube was made of coiled iron, but experience demonstrated the superiority of steel.

The 9-inch 12-ton gun consists of a solid ended steel barrel, a forged breech-piece, a cascabel, a B tube, a trunnion-ring, and 7 coils,—12 separate parts. The breech-piece, formed of wrought-iron slabs welded together, drawn out, bored, and turned, is shrunk upon the steel tube, toughened in oil. The cascabel-screw receives, in conjunction with a shoulder at rear end of breech-piece, the endway pressure of the steel tube. Two coils welded together form the B *tube.* The breech-piece and B coils are connected by a hook-joint, the rear end of each being hollowed out to receive a corresponding annular projection of the forward part of the other.

The steel tube is designated by the letter A; the successive series of superimposed coils by the letters B, C, D, E. The coils in each series are numbered from the rear, forward. The B tube is the terminal envelope of the A tube.

In the 100-ton gun the A tube is composed of two parts joined by a ring. The forged breech-piece is replaced by a heavy coil, which forms part of the B tube. The trunnions are shrunk on the B tube; the vent is axial.

The Frazer gun is a modification of the Armstrong, consisting of a few long double and triple coils, instead of several short single ones, and a forged breech-piece. The A tube of the English service gun—Woolwich gun—is bored out of a solid hammered ingot of cast steel, and oil-tempered. The B tube is composed of two single tapered coils, united by a joint, and welded endways. In 7- and 8-inch guns the breech-coil is composed of a triple coil, in which the middle coil is reversed, a double coil, and a trunnion-ring. The forward end of the triple coil is turned down to form a shoulder for the reception of the trunnion-ring. The double coil has a shoulder at its rear end to overlap the trunnion-ring which covers the joint. The three parts are then welded together. The front of the double coil is recessed to overlap the B tube, which is first shrunk on, then the breech-coil. The cascabel is screwed in and splined. The 9-inch guns and upwards have two double coils on the breech instead of one triple coil. The higher calibres have an intermediate B coil.

In the 80-ton gun there is a 2 B coil between the 1 B coil and the B tube. Over the rear end of the A tube is shrunk a breech-piece made of a single bar 12 inches thick. The C coil is a double coil, and carries the trunnions.

The metal of the Whitworth gun is obtained by melting short bars of Swedish iron with a small quantity of carbonaceous matter in crucibles and casting in round ingots, which are subjected to hydraulic pressure while fluid. The smaller guns are forged solid; the large built up. The barrel is an ingot cast hollow and hammered on a mandrel; the hoops, also cast hollow, are hammered or rolled, annealed and screwed together to form tubes, which are bored with a slight taper, and forced one over the other by hydraulic pressure. In the larger guns the breech is hooped with a higher steel than the barrel. The breech-screw is made with offsets to screw into the barrel and the two adjoining hoops. The bore is approximately a twisted prism of hexagonal base, the angles rounded off, the middle part of each face coincident with the original circular bore. To facilitate loading, that portion of each half-side of the hexagonal bore of the gun on which the right half-side of the projectile bears as it goes in is removed, thus enabling it to enter with a loose fit. In leaving, it bears on the sides which have not been eased off, and the projectile issues with its axis in line with that of the piece.

In the 120-pounder the diameter across flats is 6.4 inches, across angles, 7 inches; length, 144 inches; windage in going in, .06 inch; weight, 16,660 pounds; twist, one turn in 130 inches; weight of charge, 27 pounds; projectile, 151 pounds; length of projectile, 20.5 inches; bursting charge of shell, 5 pounds. It is very accurate, has great range and penetration.

The Lancaster gun, patented in 1850, of elliptical bore and increasing twist, failed in service, the projectiles exerting a wedging action.

The first Krupp guns were made of single ingots of cast steel forged under heavy hammers, but it was found necessary to reinforce them by hoops of steel shrunk on; the 6-inch guns having one set, the 8- and 9-inch two, the 11-inch and higher calibres three.

The tube is cylindrical, eight-tenths of a calibre thick from a point over the middle of the charge

to that at which the rings terminate, thence to the muzzle conical, diminishing to $\frac{1}{2}$ calibre. The rifling is poly-grooved; the width of grooves diminishes as they approach the muzzle. The chamber is of larger diameter than the bore, its axis above that of the rifled part. The rear of the chamber is reamed out spherically, and in this recess is fitted a Broadwell ring whose exterior is also a spherical segment. A slot cut in the rear end of the tube receives the breech-block, so guided that a motion of translation in or out gives to the front face of the block a movement forward or to the rear parallel to itself; so that the block whose front, top, and bottom are plane surfaces, its rear rounded off, is, when screwed on, well supported from behind by the correspondingly inclined rear face of the slot. The motion of translation is given to the block by a screw which runs partly in a thread cut in the upper wall of the slot. The locking is effected by a screw working in a nut having rings on its exterior partially cut away, which take in scores cut in the solid mass at the rear of the slot.

The vent is through the breech-block in the axis of the bore terminating on the face-plate. Steel and chilled projectiles are used; those of steel have their points water-tempered. They were formerly coated with lead, but rotation is now given by a band of copper which encircles the projectile near its base, being forced by pressure into a groove undercut for its reception. The band serves also as a gas-check. In some projectiles there is a second band at the forward part of the cylinder, which, without entering the grooves, steadies the projectile. Krupp's system is also applied to rifled mortars.

The Vavasseur guns, excepting the trunnions, are of mild cast steel.

Upon a tube tempered in oil is shrunk a jacket extending from the breech to a short distance forward of the trunnions and the chase-hoops. The trunnion-band and the forward and rear hoops, in short lengths of from 6 to 8 inches, are shrunk on. The rifling on the rib system is a modification of that proposed by Lynall Thomas. The projectile has 3 corresponding grooves. The twist 1 turn in 30 calibres for all calibres. A breech-plug screwed into the rear end of the jacket supports the tube. The vent is two-fifths of the length of the cartridge from the bottom of the bore.

In the 9-inch gun two series of hoops are shrunk upon the jacket. In the 12-inch the hoops are first shrunk one over the other, forming a compound hoop, which is then shrunk upon the gun.

Breech-loading cast-iron guns, hooped with steel, were introduced into the French navy about 1860. In 1871 the system in use was adopted: calibres, 5.46 inches, 7.32 inches, 9.36 inches, and 12.48 inches.

The guns of gray iron, 2d fusion, are cast hollow, chase down, and cooled from within first with air, then water. A tube of Bessemer steel, forged and tempered in oil, has welded on its rear end a collar which screws into the cast iron, and inside of which is the thread for the breech-screw. The casting is shrunk upon the tube, which does not extend the whole length of the bore, and there is difficulty in making the joint tight. Hoops of mild steel, upon one of which the trunnions are forged, are shrunk upon the gun. The large calibres have two series of hoops, breaking joints. The Broadwell ring and the slotted screw-plug are employed. An annular space about the breech-plug in rear of the gas-check, formed by the suppression of both threads of the screws for a length of about half a calibre, which was provided to receive residuum, has also the important effect of transferring the longitudinal pressure to a point somewhat removed from that part of the gun which is subjected to radial pressures.

The screw is turned with the aid of a crank, and retained by a catch when the breech is closed. On withdrawal the plug slides on to a covered bracket, hinged to the right side of the breech, on which it is swung around, leaving the breech clear. A bronze bearer hinged to the left side of the breech facilitates loading.

To utilize the heavy cast-iron guns made before the development of the power of the rifle, several methods have been proposed and successfully applied.

Parson's System of Conversion.—A steel tube with jacket of steel shrunk on the breech part, the whole inserted under pressure from rear of iron casting. A steel plug is screwed into the steel jacket against the rear of the tube, the breech being closed by a cast-iron screw-plug.

Palliser System.—A coiled wrought-iron tube consisting of two thin bands, the outer shorter than the inner one, upon breech end of which it is shrunk. The tube is closed by a solid wrought-iron breech-screw. The tube and the bore of the gun are slightly tapered. The tube is retained in place by a screw locking-ring at the muzzle, and by a screw through the cast iron just forward of the trunnions. Full and concise descriptions of these various systems of construction, in connection with the principles involved, are given in Cooke's "Naval Ordnance and Gunnery," a standard work.

Rifle projectiles, generally cylindro-conoidal in form, designed to penetrate armor, are of tempered steel, or of cast iron with chilled heads. The shells without fuzes, the shock of impact igniting the charge.

The different methods of imparting rotation to the projectile may be classified as follows:

1st. By knobs (studs) or flanges of greater or less length, of soft metal, rigidly attached and guided by the riflings, by ribs in the bore, and corresponding grooves in the projectile.

In bores not of circular section, by giving the projectile a corresponding cross-section, as in the Lancaster and Whitworth systems.

2d. By the expansion into the grooves of a portion of the projectile, or of an attached cup, ring, or rings of copper or composition, by lateral pressure of the gases, accompanied in less degree by lateral extension of the mass under compression between the gases and rounded base of the projectile; or by the compression of metal of such plastic nature as lead, either as a cylindrical mass attached to the rounded base of the projectile, or as a ring about its middle part compressed between a shoulder in front and the forward part of a hard metal cap driven by the gases over the reduced cylindrical rear part of the projectile, as in the Hotchkiss system.

3d. By the compression of enveloping coats or rings of soft metal, lead, copper, etc., larger than the bore, through which the projectile is forced. The rings are sometimes undercut to obtain radial

pressures and quick gas-check action. This system is employed only with breech-loaders.

The knob of lead was employed in England in 1774 by Dr. Linn and Capt. Blair.

Wahrendorf, before 1843, applied lead coatings to spherical shot, and in 1851 to cylindro-conic projectiles, the lead being maintained in place by grooves in the surface of the projectile around the cylinder, and others in the direction of the riflings. Subsequently he substituted three rings of lead; the forward ring being generally torn, he added a fourth of the same diameter as the bore, to insure coincidence of axes.

Cavalli employed iron projectiles with two flanges or wings inclined to suit the grooves, and two others at the junction of the cylindrical and conical parts to steady the projectile in the bore; their windage .015 inch.

Experiments in France and Belgium led to increasing the number of grooves and the substitution of pairs of buttons for the flanges. In 1855, in England, Mr. Bashley Britten and Mr. Lynall Thomas each took out patents for a conical cast-iron projectile having attached to it, in the rear, a hollow belt of lead or other soft metal.

Mr. Jeffery about the same time produced a projectile for cannon much on the plan of a Minié bullet for small-arms. Mr. Hadden, from a gun with 3 circular grooves, fired a non-expanding projectile cast with studs corresponding to the grooves. Commander Scott, of the royal navy, recommended one with ribs or "wings," with long bearings. Various modes of rifling were exhibited. Various modifications of grooves, broad and shallow, angular and deep; and in one, rotation was imparted by ribs which fitted into corresponding grooves in the projectile. Armstrong employed lead coatings for his breech-loaders.

In the United States, Dr. Reed, of Alabama, attached a cupped ring of wrought iron to the rear part of an elongated projectile, the metal cast upon it. Its diameter was the same as that of the projectile; its exterior cylindrical. It took the grooves, but the cast iron of the projectile was spalled off by the pressure of the face of the imbedded ring. The cup was then made with an entire bottom, with several holes bored through it to permit the passage of the molten metal. The exterior opposing edges of the wrought and cast iron were beveled off.

The cups were punched by machinery out of a piece of sheet-iron, and finally assumed the form of a thin conoidal segment, with its forward end imbedded in the base of the shell at some distance from the exterior of the cylinder. This obviated the necessity of beveling the rear edge of the projectile, but the imbedded part, lying in a plane of weakness, rendered its employment dangerous in large guns, although successfully employed in small field-pieces.

Early in the war of 1861–65 there appeared in the Confederate States a bronze or copper sabot in the form of a comparatively thick spherical segment secured by a central screw, and held firmly by three projections from the convex face of the plate, extending into holes in the face of the projectile, or by three projections from the projectile extending through the plate. The pressure of the gases flattens the plate, increasing its diameter, and thus causing it to take the grooves. It was called the "Tennessee" sabot, the name of its designer being unknown, and it was applied by army and navy to projectiles for heavy guns.

In the latter part of 1862, when, in consequence of the dearth of steel, solid projectiles for navy rifled guns were forged of wrought iron, an annular groove was turned in the base of each, forming a lip, which was found to take the groove as does a Minié bullet, and to cut off the escape of gas. Some of the 8-inch bolts having been made of bars welded longitudinally, it was thought they might split in the bore of the gun. To obviate this the ratchet-sabot was devised. It consists of a cupped bronze or copper plate, with a thin cylindrical lip, which, like that of the bolt, takes the grooves, and cuts off the escape of the gas. The name "ratchet-sabot" simply indicates the mode of attachment. The base of the projectile is divided into several equal sectors, usually seven, their surfaces so inclined to its axis as to form seven oblique radial depressions, each bounded on the right by a shoulder, increasing in depth with the distance from the axis. The shoulder is made slightly concave.

The sabot of corresponding form, cast to fit, and in close contact, is secured by a central screw, one screw being sufficient for 8-inch projectiles. Trial having shown its superior efficiency it was adopted for all cast-iron projectiles employed in the Confederate navy. The first made were heavy, but experiment having shown that the weight could be advantageously reduced, they were subsequently made much lighter. Descriptions and accurate drawings of nearly all the rifled projectiles used by the armies in Virginia are given in "Professional Paper No. 14, Corps of Engineers," by Gen. H. L. Abbot, U. S. army.

By experiments made at Charleston, in October, 1863, with a 12¾-inch Blakely rifle, fired with charges of from 30 to 55 pounds of powder placed in front of a chamber 26 inches long and 6.2 inches in diameter, and by experiments made at Augusta Arsenal, in March, 1864, by a board of artillery officers, "the fact was clearly established that the common opinion as to the danger incurred on the displacement of the projectile from the charge is without sufficient foundation; that the maximum strain on the gun is experienced when the projectile is closely rammed home on the charge, the latter being packed and fitting the bore; that as the projectile is removed from the charge towards the muzzle the strain decreases, and is at its lowest point when it is at or near the muzzle itself."

This important discovery directed attention to the utility of the "air-space" as a means of diminishing initial pressure with increased charges, by which, when applied in bores of length sufficient to afford time for the action of a sustained impulsive force, extraordinary initial velocities have been obtained. In recent experiments at Shoeburyness (May, 1880) with an 8-inch rifle, charge 90 pounds of powder, and shell of 184 pounds, a velocity of 2300 feet was given. With a shell of new form a velocity of 3000 feet is said to have been obtained. The employment of enlarged chambers is now general.

Under the direction of the Bureau of Ordnance, 100-pounder and 60-pounder Parrott guns have been tubed and converted into 6.4-inch and 5.3-inch breech-loaders on the French system; 11-inch Dahlgren guns into muzzle-loading rifles,

adding 25 per cent. to the power of the gun at the muzzle and doubling it at 1000 yards. Similar conversions of columbiads have been made, and also applications of Krupp's system of fermature. Several rifles of large calibre, designed in accordance with indications afforded by the most recent developments abroad and in this country, are to be constructed.

In 1880, Col. T. T. S. Laidley, Ordnance Department, U.S.A., made some experiments on the resistance of cast-iron, thick, hollow, cylinders, lined with tubes of different thickness of metals, to an interior pressure. The cast iron was a cold-blast, charcoal-iron having a tensile strength of 30,000 pounds per square inch, and great extensibility. The cylinders were all cast from the same furnace of metal, and were 22 inches in length and 11 inches in diameter. They were bored out to a diameter of 3.5, 4.3, and 5.1 inches respectively, leaving a solid breech of 5.5 inches, except two of the first series, which were bored through, and the breech closed with a screw-plug 5.5 inches long. Three of the cylinders were lined with copper tubes 0.1 inch thick, two with brass tubes .5 inch thick, and three with coiled wrought-iron (Ulster) tubes, .9 inch thick, leaving the bores 3.3 inches in diameter. The bores were filled with beeswax to a depth of 10 inches; a copper ring similar to the Broadwell gas-check placed on the beeswax, and a steel piston on top of it. The base of the cylinder rested against the beam of the testing-machine, and the piston was forced in till the cylinders were burst. The bursting strains were in direct proportion to the area of cast iron in the longitudinal section through the axis.

No. 2 took a permanent enlargement of the bore of 0.187 inch, and an increase of 0.078 inch in the diameter of the exterior, without breaking or showing any sign of a crack.

Dimensions of Cylinders and Bursting Strains.

Wrought iron	0.9	2.943	698,100

While foreign states, recognizing the superiority of the rifle, have augmented the power of their armaments, the United States have deferred action until costly experiments and competitive trials abroad have developed all that is necessary to be known in order to construct ordnance of a permanent character.

A point has now been reached from which a just departure may be taken, and it only remains for the government, in making the necessary appropriations, to give the ordnance of this country a relative efficiency not less than it possessed before the advent of the breech-loading rifle.—*J. M. Brooke.*

* Diameter of bore of lining, 3.4 inches; the others, 3.3 inches.

Ordnance-hoy. A hulk expressly fitted for transporting ordnance stores.

Organization. The navy is organized as a department under the Executive of the nation. The President is by the Constitution the commander-in-chief of the navy. He is represented by a Secretary, who is an officer of the Cabinet. To aid the Secretary in carrying out his duties the business of the Department is divided under eight permanent bureaus. Each bureau is presided over by an officer of the navy, who, if below the grade of commodore, is given that grade or its relative rank whilst in office.

The bureaus are those of:

Ordnance.—Charged with the administration of everything pertaining to the armament of ships, including the experimental battery at Annapolis, torpedo school at Newport, and nitre beds at Malden. This bureau is represented on shore, at dock-yards and manufactories, by inspectors and assistant inspectors of ordnance, and at sea by the ordnance-officers and gunners of ships.

Equipment and Recruiting.—Charged with the canvas, rigging, and general equipment of ships, including coals and wood. The enlistment, service, discharge, re-enlistment, burial, and organization of the men, including the apprentice system, and receiving-ships or barracks. This bureau is represented on shore, at dock-yards by the equipment-officer, by the commanding and executive officers of receiving-ships or barracks, by the officers detailed for recruiting duty, and by such officers as may be appointed as special inspectors of equipment; at sea by the equipment-officers of ships, the boatswains and sailmakers.

Navigation.—Charged with the administration of everything pertaining to the navigation of ships, including the Hydrographic Office, Signal Office, Naval Observatory, Nautical Almanac Office, and Office of Detail, from which orders are issued to officers for service and in which the officers' rolls are kept. At dock-yards this bureau is represented by the navigation-officer, and at sea by the navigating officers of ships. Scientific expeditions are usually under its direction.

Yards and Docks.—Charged with the administration of everything connected with buildings, wharves, docks, streets, railways, and such other government property of a permanent nature as may be at any of the naval stations. In addition to the foregoing, this bureau is charged with the direction of the Naval Asylum, and, at navy-yards, is represented by the civil engineers.

Medicine and Surgery.—Charged with the administration of everything connected with the hygiene and surgery of the service, including the naval hospitals, sick quarters, and naval laboratory. This bureau is represented on service by the officers of the medical corps.

Provisions and Clothing.—Charged with the provisioning and clothing of the navy. This bureau is represented by the officers of the pay corps, who are besides charged with the care of all funds which may be placed in their hands by the Treasury Department for the use of the navy, accounting for the same to the Second Comptroller, and Fourth Auditor of that Department.

Steam Engineering.—Charged with the administration of everything connected with the steam machinery of ships. This bureau is represented

on shore and afloat by the officers of the engineer corps.

Construction and Repair.—Charged with the construction and repair of the hulls, decks, bulkheads, spars, and boats of vessels. This bureau is represented at dock-yards by naval constructors, and at sea by the executive-officers and carpenters of ships.

The office of judge-advocate-general is to be charged with the administration of naval justice. See JUDGE-ADVOCATE-GENERAL.

The Secretary is assisted in his legal decisions by an officer detailed from the Attorney-General's Office, and in his pecuniary ones by the Second Comptroller of the Treasury.

The shore stations, consisting of the navy-yards at Portsmouth, N. H., Boston, Mass., New York, N. Y., League Island, Pa., Washington, D. C., Norfolk, Va., Pensacola, Fla., and Mare Island, Cal., and the Naval Academy at Annapolis, Md., are commanded by officers detailed as commandants, who are directly responsible to the Secretary of the Navy. All the bureaus are represented at the yards as has been stated. There are besides the naval stations at New London and Port Royal.

The marine corps is commanded by a colonel commandant. This officer commands the marines, and has charge of their detailing for sea-service, quartering, commissariat, clothing, and pay, being assisted by officers of the corps. He has entire control of the marine barracks at Washington, D. C., and controls those at the naval station under the commandants of the yards.

Many officers of the navy are detailed for duty under the Treasury Department, occupying positions in the Light-House and Coast Survey Departments.

The officers of the navy are divided among the line, and the medical, pay, engineer, and construction corps. There are besides chaplains, professors, civil engineers, and the officers of the marine corps.

The cruising navy is divided into five squadrons, each commanded by a flag-officer, who hoists his flag on board one of the vessels of his squadron.

Each flag-officer has certain officers detailed to act as his personal staff, accompanying him in case he shifts his flag. There are two lieutenants who act as flag-lieutenant and secretary, and several lieutenants and junior officers as aids; the number and rank depending on the size of the squadron.

The general staff, who also perform duty as officers of the flag-ship in small squadrons in peace-time, are a chief-of-staff (commanding officer), a fleet-surgeon, a fleet-paymaster, a fleet-engineer, and a fleet marine officer. In war-time the general staff would always accompany the flag-officer.

The organization of a ship of war is as follows:

A commanding officer, who is responsible for and commands the ship and everything in her.

An aid or executive to the commanding officer, who assists him in his duties, and takes special charge of everything belonging to the Bureaus of Equipment and Recruiting, and Construction.

A navigator, who assists the commanding officer in navigating the ship, and takes special charge of everything belonging to the Bureaus of Navigation and Ordnance.

Watch- and division-officers, who carry on the routine of the ship, representing the commanding officer, in turn, on the deck of the ship.

Officers of the forecastle and midshipmen of the watch, who assist the watch-officers in all their duties.

Assistant navigators, who assist the navigator.

Aid to the commanding officer.

Mates of decks, holds, and hull, who have charge, under the executive- and watch-officers, of the parts of the ship named.

A medical officer and one or more assistants, who attend to the sick and wounded.

An engineer and assistants, who have charge of the engines and boilers.

A paymaster, assisted by a clerk, who has charge of the clothing and provisions in store, issuing them on requisition. He also pays the officers and men, and has charge of the disbursement of the moneys expended by the representatives of the different bureaus.

A marine officer, who commands the marine-guard.

A chaplain.

A gunner, a boatswain, a sailmaker, and a carpenter also form part of the complement of large ships.

The organization of the crew is based on the necessities of the ship when under sail and steam, slightly modified in vessels of peculiar rig to suit the requirements of the battery.—*Theodore B. M. Mason, Lieutenant U.S.N.*

Organization, when referred to in works on seamanship, relates to the organization of a ship's company. The duties of officers on board ship are clearly defined by regulations. But the crew, composed of able seamen, ordinary seamen, landsmen, and boys, many of them utter strangers to one another and to the officers, of some foreigners, of merchant-sailors unaccustomed to the routine of a ship-of-war, of others again totally ignorant of a ship of any kind, forms altogether a motley crowd which must be "sorted out," as it were, and the work of the ship, as a powerful engine of war, so distributed among them that, each one acting the part assigned him, the daily routine may be performed efficiently and expeditiously. The organization and the routine, together with the drills and exercises which form their principal feature, all have for their ultimate object a state of preparation for immediate battle.

The first step is the selection of a good corps of petty officers,—boatswain's mates, quartermasters, quarter-gunners, coxswains, captains of the five "parts of the ship" (forecastle, fore-, main-, and mizzen-tops, and after-guard), captain of the holds, etc. Next come the able seamen, who are selected according to their age and build, for the forecastle and tops, the younger and lighter being stationed aloft. The ordinary seamen are mostly stationed aloft, while the landsmen and boys are distributed nearly equally among the different parts of the ship, with the exception of the after-guard, where the landsmen are in excess. The petty officers being culled out, we next proceed to make out the watch-bill, which forms the basis of the organization. The entire crew is divided into two watches,—starboard and port,—taking care in doing so that the

intelligence and physical force shall be equally distributed between the two. Each member of the crew has his watch number, the odd numbers belonging to the starboard watch, the even to the port. Thus, beginning with the forward part of the ship, the captain of the starboard watch of forecastle is No. 1 on the watch-bill; the captain of the port watch of forecastle No. 2, and so on through the ship's company. Each watch is divided into two equal parts, called respectively *first* and *second* parts, each part being headed by a captain. Thus we have the second captain of the starboard watch of forecastle in charge of the second part of starboard watch of forecastle-men, and so on for each part. These subdivisions are called *quarter-watches*. Having completed the watch-bill, we next fill out the quarter-bill,—*i.e.*, station the crew at the guns and in the different parts of the ship, with a view to battle. The guns' crews for the odd-numbered guns are selected from the starboard watch (referring to ships carrying their batteries in broadside); the first part of the gun's crew, when preparing for battle, casting loose and providing the starboard gun of the pair, the second part the port. The port watch man the even-numbered guns, the first part of each gun's crew casting loose and providing the port gun of the pair, the second part the starboard. One-half of each gun's crew are *riflemen*, provided with the most approved pattern of rifles, and one-half are *boarders*, provided with cutlasses and pistols. There are also *wreck-clearers*, who, when called upon, leave their guns and assist in the management of the ship; and *firemen and pumpmen*, whose duties are suggested by the names. In addition to the gun divisions, there are the powder division, for supplying ammunition, the navigator's division (under which come the steering of the ship, the handling of sails, spars, and rigging, the repairing of damages, etc.), the engineer's division, and the surgeon's division. The marines form a division by themselves. The fire-bill is the next consideration, after which bills for *getting under way*, *anchoring*, *loosing and furling sail*, *bending sail*, *tacking and wearing*, *reefing*, *up and down topgallant and royal yards*, *mooring and unmooring*, etc., to which it has been customary of late to add *clearing ship for action*, *man overboard*, *abandoning ship*, *cutting-out expedition*, and *disembarking small-arms men and marines*. For the latter purpose the guns' crews are formed into companies, and the latter into a battalion when admissible. The station-bills are so arranged that any given evolution or manœuvre may be performed by either watch. By the use of skeleton station-bills much of the labor of organization may be accomplished before the crew is received on board. In addition to the foregoing, every boat in the ship must have its own coxswain and crew,—a crew being detailed from each watch at sea for the life-boat,—and each member of the ship's company be assigned to a mess. There are also howitzer crews, and crews for Gatling-guns.

When it becomes a question of organizing a crew of 700 or 800 men, all to be kept within the limits of one ship, and all to work together harmoniously and effectively, and to be kept constantly well in hand, the labor calls forth the very highest qualities an officer can possess. The training system, now happily inaugurated, by which American boys are specially trained for men-of-war's men, will, in time, materially lighten the labors of an executive-officer, upon whom the duties of organization chiefly devolve. —*S. B. Luce, Captain U.S.N.*

Organling. A kind of fish; orgeis.

Orgeis. A certain fish, supposed to be so called from the Orkneys, on the coast of which it is taken.

Orion (the mythical lover of Diana). The most brilliant constellation of the heavens, figured as a man with club and lion's skin. The stars α, β, γ, κ are in the form of a great quadrilateral; α at the northeast angle being in the right shoulder of Orion, and the nearest to the Twins; β at the opposite angle in the left foot; γ is in the left shoulder, and κ is in the right leg. In the middle of the quadrilateral are three stars of about the second magnitude, δ, ϵ, ζ, disposed in an oblique line; these form the belt of Orion, from which depend a luminous train of small stars called the sword. This constellation is surrounded by a series of the most conspicuous stars in the heavens, Aldebaran, Capella, Castor and Pollux, Procyon, Sirius, and Canopus. α *Orionis*, Betelguese, or Betelguex. β *Orionis*, Rigel. γ *Orionis*, Bellatrix.

Orlop. The lowest deck, formerly called "over-lop," consisting of a platform laid over the beams in the hold of ships of war, whereon the cables are usually coiled, and containing a few state-rooms as well as the chief store-rooms. In trading-vessels it is often a temporary deck.

ORLOP-BEAMS. The beams which support the orlop-deck, but are chiefly intended to fortify the hold.

Ornaments. The carvings of the head, stern, and quarters of the old ships.

Ornithæ. An ancient term for the periodical winds by which migratory birds were transported.

Orrery. A machine which exhibits the motion of the heavenly bodies on their orbits.

Orthographic Projection. The orthographic projection of the sphere is a natural projection made by straight lines at right angles to the primitive or plane of projection. The eye is conceived to be infinitely distant from the sphere, so that the visual rays are parallel to one another, and a diametral plane is chosen for the primitive. See PROJECTION.

Osaka, the principal city in industry and commerce of Japan, is situated on the island of Hondo. It has a large foreign trade, and ships large amounts of tea, silk, silk-worms' eggs, and copper. It has a steam paper-mill, arsenals, machine-shops, and is a great centre of native manufactures. Pop. 282,000.

Oscillating-cylinder Engine (*Oscillating-engine*). One in which the cylinder is supported, about midway, by hollow axles, called trunnions, and on which it oscillates to allow the piston-rod, which is connected directly to the crank-pin, to accommodate itself to the motion of the crank, thus dispensing with the connecting-rod; the steam enters through one trunnion to the steam-chest and is exhausted through the other.

Oscillating-piston Engine. One in which the piston, rectangular in form, oscillates on one side, like a door on a hinge; the piston-shaft which acts as the hinge, extends beyond the steam-chamber, and by means of a reciprocating

arm and connecting-rod to the crank-pin gives motion to the propeller shaft.

Oscillating-valve Engine. One the main steam-valves of which are cylindrical in form, and act by partial rotation within a cylindrical seat; the valves are hollow and have parts which, by the oscillating motion, are alternately opened and closed to other parts in the seat which lead to the steam-cylinder.

Osmond. The old term for pig-iron.

Osnaburg. In commerce, a coarse linen cloth manufactured in Scotland, but resembling that made at Osnaburg, in Germany.

Osprey. The fish-hawk, *Pandion haliœtus.*

Os Sepiæ. The commercial term for the sepia, or cuttle-fish bones.

Ostend. A seaport town of Belgium, in West Flanders, on the North Sea, in lat. 51° 14′ 1″ N., lon. 2° 55′ 5″ E. It has a large harbor, docks, piers, and basins, rope-walks, and building docks, a large trade in agricultural products, and regular steam communication with London and Dover. Pop. 17,000.

Ostracion. A genus of rough-skinned fishes having the body covered with an armor of solid, immovable, long plates, the tail, fins, etc., passing, as it were, through holes in the coat of mail; trunk-fish.

Oswego is situated on Lake Ontario, at the mouth of the Oswego River, in Oswego County, N. Y., in lat. 43° 28′ N., lon. 76° 35′ W. It is the most populous city on Lake Ontario, except Toronto, Canada. It has a good harbor, sheltered by long and costly piers, and defended by Fort Ontario. Great quantities of grain, lumber, etc., are received here, part of which is transshipped through the Oswego Canal and by the various railroads centring here. The city contains a great many flour-mills, several iron-foundries, machine-shops, ship-yards, and a large corn-starch manufactory. Pop. 23,000.

Otary (*Otaridœ*). A family of the seal tribe (*Puocidœ*), distinguished from the other members of the family by a projecting auricle or auditory conch, and by the four middle incisors having a double cutting edge. The membrane which unites the toes of the hind feet is prolonged into a flap beyond each toe. The fore legs are placed farther back than in the true seals, giving the otaries the appearance of having a longer neck. The hind legs bear a closer resemblance to the fore legs than in the true seals. See SEA-LION.

Otter-pike. The lesser weever, *Trachinus draco;* also called *sea-stranger.*

Ottomites. An old term for Turks.

Out-and-outer. An old phrase signifying thorough excellence; a man up to his duty, and able to perform it in style.

Out-board. Outside the ship. Farther from the keel.

Outer-jib. See JIB, OUTER.

Outfit. The stores and equipments with which a ship or boat is provided. The wearing apparel of an individual.

Outhaul. A rope for hauling out the clew of a boom-sail or the tack of a lower stun'sail.

Outlandish. Foreign; but means with Jack a place where he does not feel at home, or a language which he does not understand.

Outlying. Beyond the coast; as, outlying rocks.

Out-pensioners (*Eng.*). Those entitled to pensions from Greenwich Hospital, but not admitted to "the house."

Out-ports. Those commercial harbors which lie on the coast.

Outregans. Canals or ditches navigable by boats.

Outrigger. A counterpoising log of wood thrust out to windward from the side of a canoe to prevent capsizing. Any spar thrust out to give a lead to a purchase, or to extend a sail.

Outwards. A vessel is said to be entered outwards or inwards according as she is entered at the custom-house to depart for, or as having arrived from, a foreign port.

OUTWARD CHARGES. Pilotage and other dues incurred from any port; the reverse of *inward charges.*

Ouvre L'Œil. A mark on French charts over supposed dangers.

Over-anent. Opposite to.

Overbear. One ship *overbears* another if she can carry more sail in a fresh wind.

Over-boyed. Said of a ship when the commissioned officers are very young.

Overfall. A rippling or race in the sea, where, by the peculiarities of the bottom, the water is propelled with immense force, especially when the wind and tide, or current, set strongly together. See RIPS.

Over-gunned. Said of a vessel rendered inefficient by carrying too many guns, or guns of too great weight.

Overhang. The part of a deck or bow which projects over the main body of the vessel.

Overhaul. To examine; to inspect. To gain upon in a race or chase. To separate the blocks of a tackle by lighting the falls through.

Over-heating Pipe. A pipe used as a superheater for converting saturated steam into superheated or dry steam.

Overlay Days. Days for which demurrage can be charged.

Over-loft. An old term for the upper deck of a ship.

Over-masted. The state of a ship whose masts are too high or too heavy for her weight to counterbalance.

Over-press. To carry too much sail on a ship.

Over-rake. When waves frequently break in upon a vessel riding at anchor in a head-sea, they are said to *over-rake* her.

Over-rigged. A ship with more and heavier gear than necessary.

Over-risen. A ship too high out of the water for her length and breadth, so as to make a trouble of lee-lurches and weather-rolls.

Over-running. Applied to ice, when the young ice overlaps, and is driven over.

Over-sea Vessels. Ships from beyond the sea, as distinguished from coasters.

Overslaugh. A bar in a river. To bar the promotion of; to ignore an officer's claims to any particular duty or privilege.

Over-swack. An old word signifying the reflux of the waves by the force of the wind.

Owler. An old term for a smuggler. A person who keeps late hours.

Oxbows. Bends or reaches of a river.

Ox-eye. A small cloud, or weather-gall, seen on the coast of Africa, which presages a severe storm. It appears at first in the form of an ox-eye, but soon overspreads the whole sky,

accompanied by a violent wind, which scatters chips in all directions, and many are sunk downright. Also, a water-fowl.

Oxyrhincus. A large species of the skate family.

Oyster (Lat. *Ostrea*). This name is generally understood to signify the species of Ostracean bivalve called *Ostrea edulis*, which is one of a numerous genus characterized by an inequivalve shell, composed of two irregular lamellated valves, of which the convex or under one adheres to rocks, piles, or to the shell of another individual of the species. The animal has neither a byssus nor a foot; it is the best flavored of its class and has, consequently, been always much esteemed. Vast beds of oysters are artificially formed and attended to with great care in many localities. Oysters formed a great luxury among the Romans, and, as is customary now, were served at the commencement of a repast. The various States of the Union in the waters of which oysters abound have regulated by law the time of taking and exposing them for sale. The trade in oysters has grown to enormous dimensions in the United States, aggregating many millions of dollars in value annually.

Oyster-catcher, or Sea-pye. The black and white coast-bird, *Hœmatopus ostralegus.*

P.

P. In the log-book, *p* denotes *passing showers.*

Pacific. The name given by Magellan, the first European who traversed it, to the ocean which extends between America on the east and Asia and Australia on the west, in consequence of his enjoying fair weather on entering it, having previously experienced tempestuous gales in the strait which bears his name. The Pacific is the greatest expanse of water on the globe. See OCEANS.

Pacific-iron. An iron at the end of a yard, over which is shipped the boom-iron for the stun'sail boom.

Pack-ice. A large collection of broken floe huddled together, but constantly varying its position; said to be *open* when the fragments do not touch, and *close* when the pieces are in contact.

Packing. Metallic rings, braided hemp, cotton, or wire, and various preparations of rubber, canvas, asbestos, plumbago, etc., used to make steam- and water-tight joints around piston-rods, valve-stems, and between flanges; also for slip-joints of long pipes.

PACKING-BOX. The chamber around a piston-rod, valve-stem, etc., to receive the packing; a stuffing-box.

PACKING-RINGS. Metallic rings surrounding steam- or water-pistons which expand against the side of the cylinder and prevent leakage. In the ordinary steam-piston there are three: two narrow ones surround a third, equal in width to the other two. These rings are turned up larger in diameter than the space they are to occupy, and a piece is cut from their circumference, which permits them to be sprung into place, and their elasticity, aided by springs, causes them to press tightly against the surface of the cylinder.

Pad. A package of some soft material like oakum, or sail-cloth, or both combined, and used to prevent wear when two bodies are chafing each other; a fender made of soft material.

Paddle. A wooden implement, shorter and broader than an oar, used in propelling a boat. It is managed with both hands without a row-lock, and is held vertically. The float of a paddle-wheel.

PADDLE-BEAMS. Two large beams extending out sufficiently from the sides of paddle-wheel steamers to receive the spring-beam; a frame is thus formed on which to erect the paddle-box.

PADDLE-BOX. The frame of wood which encircles the upper part of the paddle-wheel.

PADDLE-BOX BOATS. Boats made to fit the paddle-box rim, stowed bottom upwards on each box.

PADDLE-WHEEL. A wheel with paddles or floats on the periphery, used for propelling vessels. There are two principal kinds, the *radial* and the *feathering* wheel. In the former the paddles are fixed; in the latter, by a system of mechanism they are made to pass through the water in nearly a vertical position. The first use of steam in the propulsion of vessels of which we have knowledge is that said to have been made by Blaco de Garay, in 1543, in a vessel of 200 tons burden, in the port of Barcelona, Spain. In 1588, Ramelli designed a paddle-wheel, flat-bottomed boat, worked by men turning a crank. Before the year 1700 more than a dozen patents were taken out in Europe having for their object the propulsion of boats by wheels, including one by the Marquis of Worcester. In 1682 a tow-boat was used at Chatham, the wheels being turned by horse-power. In 1729, Dr. John Allen obtained a patent in England for propelling a vessel by forcing water through the stern.

In 1787, Patrick Miller, of Dalswinton, England, published a pamphlet describing a vessel propelled by paddle-wheels, designed to be worked by a steam-engine. In 1789, Miller built a boat 25 feet long by 7 feet beam, worked by a double engine having 18-inch cylinders, and with it made 7 miles an hour on the Forth and Clyde Canal. This boat was engined by Symington.

In 1784, James Ramsay, an American, obtained a patent for an invention designed to work oars by steam. Two years later he had patented an application of steam to the paddle-wheels of vessels, and in 1787 built a vessel 60 feet long by 12 feet beam, with an engine having a 12-inch cylinder. This vessel made a speed of 7 miles an hour. In 1790 he built another boat, which made regular passage on the Delaware River.

In 1797 an experiment took place near Liverpool on oars worked by steam, the engine making 18 strokes per minute.

In 1801, Lord Dundas employed Symington to fit up a steamboat for the Forth and Clyde Canal Company. This boat, completed in March, 1802, was called the "Charlotte Dundas," and made the trip between Port Dundas and Glasgow, a distance of 19½ miles, in 3½ hours.

John C. Stevens and Oliver Evans both experimented in the same direction, but it was left for Robert Fulton to practically establish the feasibility of steam navigation. His first attempt was made in France, in 1803, by the aid of Mr. Robert R. Livingston, but this was not successful.

In 1807, Fulton built his first boat in America, which was launched on the East River, at New York, and an English engine was fitted on board. This boat, named the "Clermont," was 130 feet long by 18 feet beam, and 7 feet depth. She started on her trial-trip from New York to Clermont, and thence to Albany, August 7, 1807. The whole distance of 110 miles was made in 24 hours. She created the utmost astonishment and even dismay along the shores of the Hudson.

The first steamer to cross the Atlantic was the "Savannah," which made the passage in 1819. Her paddle-wheels were made to take to pieces in bad weather.

Paddy, or Padi. Rice in the husk, so called by the Malays, from whose language the word has found its way to all the coasts of India.

PADDY-BOAT. A peculiar Ceylon boat.

Paddy's Hurricane. Not wind enough to float the pennant.

Padrone, or Patron. The master of a small coaster in the Mediterranean.

Paduan. A small Malay vessel armed with two guns, one aft and the other forward, for piratical purposes.

Pahi. The large war-canoe of the Society Islands.

Painter. A rope attached to the bows of a boat, used for making her fast; it is spliced with a thimble to a ring-bolt inside the stem.

Paixhan-gun. Introduced by the French Gen. Paixhan about 1830, for the horizontal firing of heavy shells, having much greater calibre, but proportionately less metal, than the then current solid-shot guns.

Palæoniscus. A genus of ganoid fishes, with a fusiform body, covered with rhomboid scales, a heterocercal tail, and moderately-sized fins, each furnished with an anterior spine. The single dorsal fin is opposite to the interval between the anal and ventral fins. Twenty-eight species have been described from the Carboniferous and Permian measures.

Palaver. Flattery; blarney; idle talk.

Palermo, the capital of Sicily, has its port on the north side of the island. The town is built in the form of an amphitheatre, facing the sea, and is surrounded by an old wall. Adjoining the water is Fort Castellamare. The principal buildings are the royal palace, the observatory, armory, mint, custom-house, and public library. The port is inclosed by a mole 1300 feet in length, terminated by a light-house and battery. A second interior port is reserved for the marine. Palermo is the residence of the military commandant of the island, and has an arsenal and ship-building yards. The principal articles of export are sumac, wine, and spirits, fruits, sulphur, skins, oil, essences, etc. The fisheries of the coast are also very productive. Lat. 38° 8′ 2″ N.; lon. 13° 22′ 2″ E. Pop. 230,000.

Palinurus. The steersman of the vessel of Æneas, drowned, according to Virgil, off the coast of Italy, and afterward met with by the Trojan hero in the shades. A promontory on the coast received his name.

Pallet. A ballast-locker formerly used to give room in the hold for other stowage.

Palleting. A light platform above the bottom of the magazines to keep the powder from moisture.

Palliobranchiates (Lat. *pallium*, a mantle, and *branchia*, gills). The name of an order of acephalous mollusks, including those in which the gills are situated on the internal surface of the lobes of the mantle.

Palm. The triangular face of the fluke of an anchor. Also, a shield-thimble used in sewing canvas, rope, etc. It consists of a flat thimble to receive the head of the needle, and is fixed upon a piece of canvas or leather across the *palm* of the hand, hence the name.

Palma, in Spain, is the capital of the island of Majorca, and of the province of the Balearic Isles, in lat. 39° 34′ N., lon. 2° 45′ E., and has a fine harbor in the Bay of Palmas. Two light-houses stand at the entrance off Porti Pi, a narrow road, where the large vessels anchor. Palma is the port for the whole island, and has important coastwise, foreign, and colonial trade. The manufactures comprise cotton, linen, woolen, and silk tissues, etc. The city is surrounded by a wall 36 feet thick, with 13 bastions and 8 gates, 3 fronting the sea and 5 facing the land. Pop. 54,000.

Palmer, James C., Surgeon-General U.S.N. Born in Maryland. Appointed from Maryland, March 26, 1834; entered the service as assistant surgeon; attached to frigate "Brandywine," Pacific Squadron, 1835; sloop "Vincennes," cruise around the world, 1836; rendezvous, Baltimore, 1837; Exploring Expedition, 1838–42; navy-yard, Washington, 1842.

Commissioned as surgeon, October 27, 1841; sloop "St. Mary's," Home Squadron, 1844–46; sloop "Vandalia," Pacific Squadron, 1850–53; receiving-ship "Baltimore," 1853–56; frigate "Niagara," Cable Expedition, 1857; sloop "Macedonian," Mediterranean Squadron, 1858–60; Naval Academy, 1861–63; fleet-surgeon, flag-ship "Hartford," West Gulf Squadron, 1863–65; battle of Mobile Bay, August 5, 1864; Naval Hospital, New York, 1866–69; special duty, Newport, R. I., 1870–72; chief of Bureau of Medicine and Surgery, 1872–73. Retired June 29, 1873.

Palmipeds (Lat. *palma*, a palm, and *pes*, a foot). The name given by Cuvier and Temminck to an order of birds corresponding to the *Anseres* of Linnæus and the *Natatores*, or swimming-birds, of Illiger.

Pamban Manche, or Snake-boat. A canoe used on the numerous rivers and back-waters of Cochin China, from 30 to 60 feet long, and cut out of the solid tree. The largest are paddled by about 20 men, double-banked, and, when pressed, they will make as much as 12 miles an hour.

Pampero. A violent wind from the southwest over the immense plains or pampas of the Rio de la Plata, where it rages like a hurricane.

Panama is situated on the Gulf of Panama, on the south coast of the isthmus of the same name, and is the capital of the state of Panama, one of the United States of Colombia of South America. The most important part of the town stands on a peninsular tongue of land. The rise and fall of the tide at Panama is from 16 to 21 feet, owing to which ships lie at anchor in the harbor at some distance from the shore. The harbor is protected by numerous islets, and affords secure anchorage. The city has very little trade, and is only important as a mail station and the Pacific terminus of the Panama Railroad. Lat. 8° 57′ 13″ N.; lon. 79° 31′ 58″ W. Pop. 11,500.

Pancakes. Thin rounded spots of floating snow-ice, in the Arctic seas, and reckoned the first indication of the approach of winter, in August.

Pangaia. A vessel of East Africa, with one mat-sail of cocoa-nut leaves, the planks being pinned with wooden pins, and sewed with twine.

Pannikin. A small tin pot.

Pannyar. Kidnapping negroes on the coast of Africa.

Panshway. A fast-pulling passenger-boat used on the Hooghly.

Pantograph. An instrument to copy or reduce drawings.

Pantometer. An instrument for taking angles and elevations, and measuring distances.

Paper Boat. Paper boats are much used in racing. They are made by applying sheets of manilla, or unbleached linen, paper to a model corresponding to the form of the boat. The whole is covered with boiled linseed oil and turpentine, and afterward with shellac. The framing is then inserted. The boats are impervious to water, and weigh about two-thirds as much as a wooden boat of the same dimensions.

Paper Nautilus. A testaceous cephalopod, so called from the fragile nature of the boat-like shell in which it occasionally floats on the still seas of the warmer latitudes. See ARGONAUTA.

Par, or Parr. The samlet, brannock, or branling.

Pará, one of the principal seaport cities of Brazil, is situated on the Bay of Guajara and the right bank of Pará River. The cacao, caoutchouc, isinglass, rice, and drugs exported from Brazil are chiefly from Pará. The trade is mostly with London, Liverpool, and North American and Brazilian ports. Lat. 1° 28′ S.; lon. 48° 30′ 5″ W. Pop. 35,000.

Parachute. An umbrella-like device for propelling a sailing-vessel in a calm. It is put overboard forward, and, upon being hauled aft by a line, it expands, and the ship is urged ahead. When the forward line is hauled upon it contracts, and offers but little resistance to the water.

Parade. See KING'S PARADE.

Parahiba, a city of Brazil, is situated on the Parahiba River, near its mouth in the Atlantic. The lower part of the town is the commercial quarter, and one of its chief edifices is a fine government warehouse. The principal buildings are the governor's palace, military arsenal, and treasury. The city has a good port, and its trade is chiefly in sugar, cotton, and Brazil wood. Pop. 14,000.

Parallax. The apparent displacement or difference of position of an object, as seen from two different points of view.

PARALLAX, ANNUAL. The greatest value of the heliocentric parallax.

PARALLAX, GEOCENTRIC or DIURNAL. The direction in which a heavenly body would be seen if viewed from the centre of the earth is called its *true* place; the direction in which it is seen from any point on the surface is called its *apparent* place. The arc of the heavens, intercepted between the true and apparent places, is called the *diurnal* or *geocentric* parallax. It varies with the altitude of the object, being greatest when the altitude is 0°, and zero when the object is in the zenith.

PARALLAX, HELIOCENTRIC. The parallax of a body with reference to the sun; its measure is the angle formed by lines from the body to the centre of the earth and the centre of the sun.

PARALLAX, HORIZONTAL. The particular value of the geocentric parallax when the heavenly body is in the horizon; it is the greatest value of the geocentric parallax. It varies with the latitude of the observer, being greatest at the equator.

PARALLAX IN ALTITUDE. A term used in contradistinction to *horizontal parallax*, to signify any value of the geocentric parallax other than that which it has when the altitude is zero.

Parallel. See ALTITUDE, DECLINATION, LATITUDE.

PARALLEL-MOTION. A device invented by Watt, for connecting a piston- or pump-rod to the working-beam, in such a manner that the former must move in a right line.

PARALLEL RULER. An instrument consisting of two pieces connected by pivoted cross-pieces, in such a manner that the two pieces may be spread apart and yet retain their parallelism.

PARALLEL SAILING. When the means of determining the longitude were not so reliable as at the present day, it was a common practice first to make the parallel of the place, and then sail due east or west. Hence the importance formerly attached to parallel sailing. See NAVIGATION.

Paramaribo, the capital town of Dutch Guiana, is situated on the west bank of the Surinam, 5 miles from its mouth in the Atlantic, in lat. 5° 49′ N., lon. 55° 22′ W., and has a population of 22,000, mostly blacks. It is the centre of trade for the colony, and has an extensive trade by sea.

Paranzello. A small Mediterranean vessel, pink-sterned, with a lateen mainsail and mizzen, and a large jib.

Parbuckle. A purchase for hauling up or lowering a cask, or any cylindrical object, where there is no crane or tackle; the middle of a rope is passed round a post, the two ends are then passed under the two quarters of the cask, bringing the ends back again over it, and being both hauled or slackened together, they either raise or lower the cask, as may be required.

Parcel. To wind tarred canvas round a rope.

PARCELING. Narrow strips of old canvas daubed with tar and wound about a rope like a bandage, previous to its being served.

Parclose. A limber-hole.

Pardoning Power. The President, as commander-in-chief of the army and navy, and of the militia when called into service, possesses the supreme pardoning power. (Constitution of United States, Art. II.) By law, in certain lesser cases, this is delegated to subordinates in the military hierarchy, who can virtually pardon by the remission or mitigation of sentences imposed by courts erected by their own authority or that of an inferior.

Different conceptions of the pardoning power of the President prevail, and its exact capacity has long been a subject of dispute. The judge-advocate of the army (Holt's Digest, 3d ed., p. 260) always held that the President could not treat as a nullity, or set aside, the sentence of a competent military court on the ground that the evidence was insufficient, but only on the ground that there had been some "fatal defect" in the proceedings, making them void *ab initio*. Further, that the pardoning power cannot reach an *executed* sentence which has been regularly imposed by a competent court, although it might, when executed only in part, remit the remainder.

In strange contrast with this are two notable naval cases. Capt. Napoleon Collins and Lieut.-Commander Geo. M. Bache, U.S.N., were tried at New York, in 1868, for suffering the U. S. steamer "Sacramento" to be lost on the coast of Coromandel, and were sentenced to be suspended from duty on the retired pay of their grades (the latter for one year) and to be publicly reprimanded. The sentences were approved and promulgated in General Orders, Feb. 10, 1868, by the Hon. Gideon Welles, Secretary of the Navy. Thirteen months later, March 11, 1869, the Hon. A. E. Borie, Secretary of the Navy of a succeeding administration, issued General Order No. 101, by which he "removed the sentence of Capt. Collins, and restored his forfeited pay to him in consequence of good conduct during the war of the Rebellion," and the same day, by General Order No. 102, the *executed* sentence of Lieut.-Commander Bache was "revoked on the ground that there is nothing in the record of the proceedings of the court-martial to justify the sentence. So much of Lieut.-Commander Bache's pay as was stopped by the sentence will be restored to him."

It is held to be as impossible in law to set aside a valid consummated sentence of dismissal as it is to recall or undo corporal punishment that has been actually undergone. Relief must be had in a new appointment by authority of Congress; hence dismissed officers are continually petitioning the National Legislature for restoration. President Lincoln decided, June 4, 1862, that he could "remove the disability" of dismissed *volunteer* officers commissioned by governors of States. Though the President has power to remit forfeitures and fines *before* they are paid, he cannot authorize their return after being legally forfeited without violating the provisions of Art I., Section 9, of the Constitution, which prohibits the taking of money from the treasury except in pursuance of specific resolves of Congress.

The analogy between a sentence prohibiting the drawing of pay that would otherwise become due, and the case of a forfeiture actually paid into the treasury by the party himself is deemed to be complete. *Ibid.* In the case of a soldier dishonorably discharged by a part of the sentence of a court, it was held that a pardon granted subsequently, while undergoing imprisonment, could not operate to entitle him to an honorable discharge. The statute of limitation as to amenability to trial for crimes committed is three years in the navy (see Navy Department, General Order 196), and the expiration of this time, where the offense is known, without charges being preferred meanwhile, operates as a full pardon. When the clemency of the President is desired, it is usually invoked by reference through the Navy Department, by direct petition in writing, or through a friend or attorney. (See COURTS-MARTIAL.)—*Henry C. Cochrane, Captain U.S.M.C.*

Pargos. A fish resembling a large bream, from which the crews of Quiros and Cook suffered violent pains and bad effects. The porgy of Africa and the West Indies.

Parhelia, or Mock Suns. Images of the true sun which appear at the same height above the horizon as the true sun, and are connected with one another by a white horizontal circle or halo, of which the pole is at the zenith, and the apparent semi-diameter equal to the sun's distance from the zenith. Those which appear on the same side of this circle with the true sun are tinted with the prismatic colors, and sometimes a part of the circle itself contiguous to them appears colored; but those which appear on the circumference opposite to the sun are always without color; whence it may be conjectured that the latter, as well as the luminous ring itself, are produced by reflection, and the others by refraction.

Pariah. The low-caste people of Hindostan; outcasts. *Pariah-dogs*, outcasts of no known breed.

Paris, The Declaration of, was adopted in April, 1856, by the plenipotentiaries of Great Britain, Austria, France, Russia, Prussia, Sardinia, and Turkey, assembled in Paris, and covers the following points:

1. Privateering is and remains abolished.
2. The neutral flag covers enemy's goods, with the exception of contraband of war.
3. Neutral goods, with the exception of contraband of war, are not liable to capture under enemy's flag.
4. Blockades, in order to be binding, must be effective; that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy.

And it was agreed that the powers which should adopt this declaration could not thereafter enter into any arrangement in regard to the application of the right of neutrals in time of war, which did not comprise all the four principles of the declaration.

The French government communicated this declaration to the government of the United States, in order to obtain its assent thereto. But the United States refused to adopt the declaration, unless the first principle should be amended by adding thereto these words: "And that the private property of the subjects or citizens of a belligerent on the high seas shall be exempted from seizure by public armed vessels of the other belligerent, except it be contraband."

The U. S. government considered that if the

first principles of the declaration were adopted without the proposed amendment, the states which kept small naval forces would be at the mercy of those which would adopt the policy and have the means of keeping up large navies. (See dispatch of Mr. Marcy to the Count de Sartiges of July 28, 1856.) Not only the United States, but Spain and Mexico also refused their consent, and so far as these powers are concerned, privateering—that is, the employment of private cruisers commissioned by the state—is still a perfectly legitimate mode of warfare.

The French Minister of Foreign Affairs made a report to the Emperor of the French, that, besides the states represented at the Congress of Paris, the following governments had declared their intentions to adhere to the four principles of the declaration: Baden, Bavaria, Belgium, Brazil, Duchy of Brunswick, Chili, the Argentine Confederation, the Germanic Confederation, Denmark, the Two Sicilies, Ecuador, the Roman States, Greece, Gautemala, Hayti, Hamburg, Hanover, the Two Hesses, Lubeck, Mecklenburg-Strelitz, Mecklenburg-Schwerin, Nassau, Oldenburg, Parma, Holland, Peru, Portugal, Saxony, Saxe-Altenburg, Saxe-Coburg-Gotha, Saxe-Meiningen, Saxe-Weimar, Sweden, Switzerland, Tuscany, and Wurtemberg.

Parker, Foxhall A., Commodore U.S.N. Born in New York. Appointed from Virginia, March 11, 1839; attached to sloop "Levant," West India Squadron, 1840; served in Florida against the Indians.

Promoted to passed midshipman, June 29, 1843; steamer "Michigan," on the lakes, 1844–45; coast survey, 1848; Mediterranean Squadron, 1849–50.

Commissioned as lieutenant, September 28, 1850; steam-frigate "Susquehanna," East India Squadron, 1851–53; coast survey, 1854–55; unemployed, 1856–59; Pacific Squadron, 1859–61; navy-yard, Washington, as executive-officer, 1861–62; doing duty with the navy on the Potomac, and with the army at Alexandria; while attached to the navy-yard at Washington, was ordered, two days after the battle of Bull Run, to Fort Ellsworth, with 250 seamen and marines, to protect it from the attack of Gen. Beauregard, who was expected to storm it, and by his prompt and vigorous action contributed greatly to the safety of Alexandria, and to rallying the men from their demoralization after the defeat at Bull Run.

Commissioned as commander, July 16, 1862; commanding steam-gunboat "Mahaska," 1863; in command of the naval battery on Morris Island, at the bombardment of Fort Sumter, from the 17th to the 23d of August, 1863; engaged with skirmishes with batteries on Potomac and Rappahannock Rivers, and off Wilmington, N. C., with rebel troops on shore, while commanding the "Mahaska," in 1863, and the Potomac Flotilla, in 1864–65; on one occasion, at the head of a small detachment of soldiers and marines, with 2 howitzers manned by seamen, Commander Parker marched some distance into Virginia and drove a force of over 100 cavalry out of Matthew's Court-House, which he took possession of; Bureau of Navigation, 1866.

Commissioned as captain, July 25, 1866; special duty, Hartford, Conn., 1867–68; navy-yard, Boston, 1869–70; commanding frigate "Franklin," European Squadron, 1870–71; member Board of Examiners, 1872.

Commissioned as commodore, November 25, 1872; was chief-of-staff to the North Atlantic Fleet, 1872; ordered to special duty at Washington, August 7, 1872, to draw up a code of signals for steam tactics, and chief signal-officer of the navy, 1873–76. In 1863 he prepared, by order of the Navy Department, systems of "Fleet Tactics under Steam," and "Squadron Tactics under Steam"; in 1865, "The Naval Howitzer Afloat"; and in 1866, "The Naval Howitzer Ashore"; all of which works are text-books at the Naval Academy. Was one of the founders of the U. S. Naval Institute, organized October 9, 1873, at Annapolis, "for the advancement of professional and scientific knowledge in the navy." In December, 1874, Commodore Parker was appointed chief-of-staff of the united fleets under command of Admiral Case, which were assembled for instruction in tactics in the Florida waters; commanding navy-yard, Boston, Mass., 1877–78; superintendent Naval Academy, 1878–79. Died June 10, 1879, while in command of the Academy.

Par-line. A term signifying the normal level of a barometer at a given station.

Parole. A promise on honor given by a prisoner of war, when allowed to go at large, that he will fulfill the conditions specified in his release. In paroling, documents are made out in duplicate, and the names and rank of the persons paroled are entered therein. A person who intentionally misstates his rank forfeits his parole and is liable to punishment. The agreement extends to the existing, and not to any future, war. No one but a commissioned officer can give a parole for himself and his command, and no inferior officer can give it without the authority of the senior officer present. Any officer or man disobeying this law renders himself liable to be punished as a deserter. The only exception is when a man has suffered long confinement without the possibility of being paroled through an officer. No person can be forced to give his parole, and ill-treatment or threats, in consequence of refusal to pledge a parole, are contrary to the laws of war. While the pledging of a parole is a voluntary act on the part of the individual, the capturing power is not obliged to grant it.

Parol Evidence. Evidence given by word of mouth, in contradistinction to that furnished by writings.

Parr. A small species of fish common where salmon breed, respecting which there has been much dispute whether it is the young of the salmon, or a trout having the general appearance of these.

Parrel. A rope or iron collar encircling the mast and attached to the slings of the yard, to confine the yard to the mast, but permitting a vertical movement.

PARREL-LASHING. The lashing between the two eyes of a rope parrel.

Parrot-fish. A fish of the genus *Scarus* inhabiting the tropical seas, so named from its resemblance to the parrot in the brilliancy of its colors and the peculiar form of its jaws.

Parrott-gun. A rifled gun invented by R. G. Parrott. See ORDNANCE.

Parry, Sir William Edward, generally known

as Sir Edward Parry, a skillful and celebrated English navigator, was born at Bath, December 19, 1790. Originally destined by his father for the medical profession, he, instead, acted on the advice of a friend, and entered as a first-class volunteer on board the "Ville de Paris," the flag-ship of the Channel fleet, in 1803. On January 6, 1810, he was commissioned as a lieutenant, and in February of the same year was sent in command of a ship to the Arctic regions to protect the British whale-fisheries. In 1813 he was recalled and ordered to the fleet then blockading the United States, where he remained until 1817. In April, 1818, he was appointed to the command of the "Alexander," and accompanied Sir John Ross in search of the northwest passage; again, in May, 1819, he was sent on the same kind of an expedition, and this time immortalized himself as the greatest of all Arctic explorers. Upon his return he was greeted with the utmost enthusiasm, and was promoted to commander, November 4, 1820, and made a member of the Royal Society. He subsequently made a second and a third voyage to the same regions, but effected nothing further of importance. He remained in England until 1827, when he made another voyage to the Arctic regions in the "Hecla," his old ship. From 1829 to 1834 he was commissioner to the Agricultural Company of Australia. In 1834 he returned to England, where he filled in succession various government offices until 1846, when he retired. June 4, 1852, he was promoted to the rank of rear-admiral of the white, and the following year was appointed lieutenant-governor of Greenwich Hospital, an office which he held till his death, July 7, 1855, at Ems, in Germany.

Parsee (Pers. *parsi*). The name given by English writers to the Persian refugees, driven from their country by the persecutions of the Mussulmans, who now inhabit various parts of India. Their principal emigration to Baroach, Surat, and the neighboring coast is supposed to have taken place about the end of the 8th century. The sacred fire, the emblem of their religion,—called *behrem*,—is believed by them to have been brought by the first emigrants from Persia, and, after many changes of place, is now preserved at Odisari and Nausari, near Surat, and at Bombay. In this latter city, under the protection of the British government, they have increased in numbers until now they form about one-fifth of the entire population. They are generally wealthy, and distinguished for activity and enterprise in the various departments of commerce and trade. Their character is variously estimated by different observers; but all agree in attributing to them industry and economy, and attachment to their religion, and to those of the higher class strong sentiments of honor and honesty.

Part. To break; as, a rope or chain. *To part company.* See COMPANY.

Partners. Any plank which is thicker than the rest of the deck-planking, for the purpose of steadying or making stronger whatever passes through the deck, as at the pumps, masts, bowsprit, etc.

Partridges. Large bombards formerly used for siege purposes. Grenades thrown from a mortar.

Party. A gang of men sent on a particular duty.

Pass. *To pass a seizing, gasket, earing*, etc., to secure them in the proper manner. *To pass the hail* is for the sentries or look-outs to utter in succession the prescribed formula to show that they are awake and attentive to their duties. *To pass the word* for a man is to summon him by name, the cry being repeated by the boatswain's mates on all decks. *To pass* an examination, inspection, etc., to undergo them with a favorable result.

Passage. A journey by water from one port to another.

PASSAGE MONEY. The charge made for the conveyance of passengers in a packet or merchant vessel.

Passandeau. An ancient 8-pounder gun of 15 feet length.

Passaree. *To passaree the foresail*, to haul out the clew, when before the wind with lower studding-sail set, by a jigger on the lower studding-sail boom.

Pass-boat. A punt.

Passport. A safe-conduct granted by the state to a citizen, which gives him protection whilst traveling. An accurate description is contained in it for the purpose of identification. See SAFE-CONDUCT.

Passed Midshipman. See MIDSHIPMAN.

Passe-volant. A name applied by the French to a wooden gun on board ship; but it was adopted by early voyagers as expressing a movable piece of ordnance.

Patache. A Portuguese tender for carrying treasure, from 200 to 300 tons, well armed and swift.

Patallah. A large and clumsy Indian boat for baggage, cattle, etc.

Patamar. An excellent old class of advice-boats in India, especially on the Bombay coast, both swift and roomy. They are grab-built; that is, with a prow-stern, about 76 feet long, 21 feet broad, 11 feet deep, and 200 tons burden. They are navigated with much skill by men of the Mopila caste and other Mussulmans.

Patamometer. An instrument for measuring the force of currents.

Pataxos. A small vessel formerly used by the Spaniards as an advice-boat.

Patch. A piece of lead over the water-cap of a time-fuze, to protect the quick-match and composition from moisture; it is removed when the shell is entered in the bore.

Patella. A genus of gasteropodous univalve mollusks the shell of which has nearly the shape of a shallow, conical dish; the limpet.

Patent Block. A block fitted with friction-rollers.

Paterero. A small piece of ordnance, now obsolete, working on a swivel and fitted on the rail, for clearing the enemy's deck and for firing into boats. A kind of small mortar sometimes fired for salutes or rejoicing, especially in Roman Catholic countries on holidays.

Paternoster-work. The framing of a chain-pump.

Path. The trajectory of a projectile. The orbit of a heavenly body.

Patoo-patoo. A formidable weapon with sharp edges, used by the Polynesian Islanders and New Zealanders as a sort of battle-ax to cleave the skulls of their enemies.

Patron. See PADRONE.

Patterson, Daniel T., Captain U.S.N. Born in New York, 1771; died at Washington, D. C., August 25, 1839. Midshipman, August 20, 1800; attached to the frigate "Philadelphia," Capt. Bainbridge, when she ran upon a reef off Tripoli, and was taken by a flotilla of gunboats, and remained a prisoner in Tripoli until 1805; lieutenant, January 24, 1807; master-commandant, July 24, 1813; captain, February 28, 1815; navy commissioner, 1828–32; and commanded a squadron in the Mediterranean in 1832–35. In 1832, he commanded the U. S. naval forces at New Orleans, and co-operated so ably with Gen. Jackson in the defense of that city that he received the thanks of Congress.

Patterson, Thomas H., Rear-Admiral U.S.N. Born in Louisiana, May, 1820. Appointed from Louisiana, April 5, 1836, as acting midshipman; attached to brig "Porpoise," survey of Southern harbors, July 20, 1836, to February 14, 1837.

Promoted to midshipman, March 3, 1847; navy-yard, Washington, March 9 to April 20, 1837; ordered to frigate "Macedonian," Exploring Expedition, April 20, 1837; sloop "Falmouth," Pacific Squadron, 1837–40; navy-yard, Washington, to 1841; Naval School, Philadelphia, 1842.

Promoted to passed midshipman, July 1, 1842; Naval Observatory, 1842–43; attached to brig "Lawrence," as acting master, West India Squadron, from August 31 to November 1, 1843, and as acting lieutenant, to April 17, 1844; attached to brig "Washington," coast survey, from April 17, 1844, to October 31, 1848.

Promoted to master, October 31, 1848.

Commissioned as lieutenant, June 23, 1849; attached to sloop "Vandalia," Pacific Squadron, from July 11, 1849, to October 12, 1852; special duty, Washington, D. C., to December 23, 1852–54; sloop "Jamestown," flag-ship, coast of Africa, to June 8, 1857; navy-yard, Washington, D. C., to October 13, 1857–59; steam-sloop "Mohican," coast of Africa, to October 15, 1861; commanding steam-gunboat "Chocura," Hampton Roads, York River; present at the siege of Yorktown, May 4, 1862; took part in expedition and was the leading gunboat up the Pamunkey River to the White House,—to open the way, and in support of Gen. McClellan's army; co-operated with the advance of Gen. Stoneman's command at the White House, in checking the approach of the enemy at that point; from early in June until October, 1862, senior officer of the naval forces in the York and Pamunkey Rivers, and in constant co-operation with the Army of the Potomac.

Commissioned as commander, July 16, 1862; commanded the steamer "James Adger," South Atlantic Blockading Squadron, from November 18, 1862, to June 27, 1865; towed the ironclad "Montauk" to Beaufort, N. C.; thence to Port Royal, January 2, 1863; blockade duty off Wilmington, N. C., July 7, 1863; cut out the steamer "Kate" from under the batteries at New Inlet, N. C., July 31, 1863; participated in the attack and capture of a flying battery, a few miles above Fort Fisher, N. C., August 23, 1863; chased ashore and captured the blockade-runner "Cornubia," between New Inlet and Masonboro' Inlet, N. C., November 8, 1863; chased and captured the blockade-runner "Robert E. Lee," off Cape Lookout, November 9, 1863,—both vessels loaded with arms and supplies for the Confederate army; captured schooner "Ella," off Masonboro' Inlet, N. C., November 26, 1863; blockade duty, South Atlantic Blockading Squadron, June 14, 1864; senior officer of the outside blockade, off Charleston, S. C., September 15, 1864; convoy duty, Maraquana passage, April 25, 1865; detached, waiting orders, June 27, 1865; commanding the steam-sloop "Brooklyn," flag-ship Brazil Squadron, September 19, 1865, to September 16, 1867.

Commissioned as captain, July 25, 1866; navy-yard, Washington, D. C., from December 26, 1867, to June, 1871.

Commissioned as commodore, November 2, 1871; special duty, Washington, 1871–72; commandant navy-yard, Washington, 1873–76; president Board of Examiners, 1876–77.

Commissioned as rear-admiral, 1877; commanding Asiatic Station, 1878, to October, 1880.

Pattison, Thomas, Commodore U.S.N. Born in New York, February 8, 1822. Appointed from New York, March 2, 1839; attached to steam-sloop "St. Louis," Pacific Squadron, 1839–42; receiving-ship, Boston, 1843; Naval School, Philadelphia, 1845.

Promoted to passed midshipman, July 2, 1845; steamer "Princeton," 1846; during the Mexican war, served in the following ships as passed midshipman and sailing-master: "Raritan," "Cumberland," "Electra," "Scorpion," and gunboat "Reefer"; coast survey, 1850–51; sloop "Portsmouth," Pacific Squadron, 1852–55.

Promoted to master, 1854.

Commissioned as lieutenant, September 12, 1854; receiving-ship, Boston, 1855–56; navy-yard, Boston, 1857; steam-frigate "Mississippi," East India Squadron, 1857–60; Naval Station, Sackett's Harbor, 1860–61; sloop "Perry," Atlantic Squadron, 1861; executive-officer of the "Perry" at the time of the capture of privateer "Savannah," off Charleston, June 4, 1861; commanding steamer "Philadelphia," Potomac Flotilla, 1861; engagement with Acquia Creek batteries, October 1, 1861, and engagement with Potomac River batteries, the latter part of October, 1861.

Commissioned as lieutenant-commander, July 16, 1861; commanding steamer "Sumter," South Atlantic Blockading Squadron, 1862; commanding the "Clara Dolson," Mississippi Squadron, 1863; commandant Naval Station, Memphis, Tenn., 1863–65.

Commissioned as commander, March 3, 1865; commanding steamer "Muscoota," Atlantic Squadron, 1866–67; navy-yard, Norfolk, 1867–69.

Commissioned as captain, June, 1870; commanding "Richmond" (second-rate), 1872; commanding "Saranac" (second-rate), North Pacific Station, 1872–73; commanding receiving-ship "Independence," Mare Island, 1874–77.

Commissioned as commodore, December 11, 1877; commanding Naval Station, Port Royal, S. C., 1878–80; commandant navy-yard, Washington, since July 10, 1880.

Paugie. A name for the porgy.

Pauhaugen. An Indian name for the menhaden. Written also *pohagen*.

Paunch-mat. A thick, strong mat made by interweaving strands of rope; it is used to protect the yards or the rigging from chafe.

Pavo (*Lat.* "The Peacock"). An unimportant constellation to the south of Sagittarius, lying between the two bright stars Antares and Fomalhaut. The northernmost star is *a Pavonis.*

Pawk. A young lobster.

Pawl. A short bar which prevents the backward motion of a capstan or windlass.

PAWL-RIM. A cast-iron rim having notches in which fall the lower ends of the pawls when the capstan is hove around.

Pay. A familiar appellation for the paymaster. To cover with melted pitch, tar, rosin, tallow, etc.; as, to pay a seam, to pay a vessel's bottom, etc. *To pay out*, to pass out a rope or chain. *To pay off*, to fall off from the wind in consequence of the force exerted by the rudder, or the arrangement of the sails, or both. *To pay round*, to turn the ship's head.

Pay Corps of the U. S. Navy. *Origin.*—The pay corps of the navy is the outgrowth of the old system of "pursers," by which name old officers still frequently call the paymaster.

The pursers were civilian appointments made for the cruise of a vessel only, and the recipients of such appointments were usually practical business men, whose duties were to provide provisions, clothing, sutler's goods, etc., for men, to purchase all articles needed in the various departments of a ship, and to pay all officers and men attached thereto, as well as to provide the funds therefor, their duties being of such a nature that they were frequently styled the ship's "husband." They were furnished bills of exchange and letters of credit, and their compensation was a commission on expenditures; so large were these commissions that some cruises proved very profitable to the purser.

Reorganization.—To save such heavy commissions and systematize accounts, as well as to render the service more homogeneous, Congress established the corps of paymasters. The pursers were incorporated into the navy under the new cognomen. Their duties remained the same in all essentials, but their relation to the navy proper, compensation, and accounting were materially changed. Instead of civilians they became officers; in lieu of commissions they receive fixed salaries; and a Bureau of Provisions and Clothing was formed in the Navy Department for receiving regular returns for those articles, as well as sutler's goods, now called "small stores." Abstracts of purchases for other Departments are required to be made to the respective chiefs of bureau of those Departments, while accounts for pay and money proper are rendered to the Fourth Auditor of the Treasury. The office is for life, and the results of this reorganization are such that the losses to the government from all sources, through the administration of the pay corps, are but a small fraction of one per cent. of amount disbursed.

Organization of pay corps at present.—On the first reorganization there were only paymasters, then assistants were added, then passed assistants; the rank (a relative one) was at first arbitrarily fixed by the Secretary of the Navy, but is now fixed by law to correspond as nearly as possible to that of the line-officers entering service at same time with the assistant paymaster. Thus reorganized, the pay corps of the navy consists of 13 pay-directors, ranking with captains; 13 pay-inspectors, ranking with commanders; 50 paymasters, ranking with lieutenant-commanders or lieutenants; 30 passed assistant paymasters, ranking with lieutenants or masters; and 20 assistant paymasters, ranking with masters or ensigns,—the alternative rank being decided by length of service.

Conditions of appointment and promotion.—Assistant paymasters must be 21 and not over 26 years of age on entering the service; they must pass a physical and a mental examination before a medical board for the first, and a board of pay-officers for the last, to prove their fitness; they are promoted as vacancies occur, and must pass a similar examination to the first on each promotion, with the addition that they must be able to speak the French and Spanish languages with sufficient fluency to do business in them, and also furnish to the Pay Board a certificate of the Fourth Auditor of the Treasury that their accounts have been kept to the satisfaction of that Department.

Bonds.—All pay-officers on entering the service, on each promotion, and as often as called on by the Secretary of the Navy, must furnish a bond with two sureties or more, worth in all double the amount of the bond; the sufficiency of the sureties must be certified to by the judge or attorney of a U. S. district court, and be approved by the Secretary of the Navy. The bond of a paymaster is $25,000, of a passed assistant, $15,000, and an assistant, $10,000.

Paymaster-general.—The chief of Bureau of Provisions and Clothing, the representative head of the corps, is styled paymaster-general, has relative rank with commodores, is appointed by the President from among the senior paymasters, and on confirmation by the Senate is commissioned for four years. The paymaster-general has supervision over all returns made to his bureau, the records pertaining thereto, the issuing of instructions to the corps, assignments to duty,—in fine, a general supervision over the corps.

Division of duty.—The service of paymasters of all grades is divided into two kinds, termed "shore-" and "sea-service," consisting ordinarily of terms of three years each, with "waiting orders" or leave intervening. "Shore-service" consists, first, of duty at purchasing agencies in the large cities for payment of transportation, purchases, and allotments; secondly, of duty in charge of provisions, clothing, and small stores at navy-yards, receiving such stores from the purchasing agencies and ships returning from cruises, and supplying ships fitting for a cruise; thirdly, of duty as paymasters of navy-yards, paying all workmen, all officers attached to the yard, and a certain proportion of officers "on leave" or "waiting orders"; and, fourthly, of duty as paymasters of receiving-ships where recruits are received; the paymaster being furnished by the recruiting officers with a descriptive list of the recruit, and a transcript giving his rating, pay, term of enlistment, etc., a copy of which must accompany him on all his transfers. To the purchasing agencies pay-directors are usually assigned; to the charge of stores, pay-inspectors; and to the payment of yards and receiving-ships, paymasters; as assistants to these, passed assistant and assistant paymasters are sometimes assigned.

The "sea-service" consists of being attached

to a vessel in commission, which vessel is usually on a cruise and attached to a fleet or squadron.

Fleet-paymaster.—The senior paymaster, attached generally to the flag-ship, is fleet-paymaster, and as such makes all purchases and distributes funds to the paymasters of other vessels in company with the flag-ship; but when separated each paymaster acts independently.

General Duties.—The duty of a paymaster at "sea" embraces all those of a paymaster, viz.: the purchasing of all supplies, the charge of all stores in his department, the payment of officers and men, and the providing of means therefor by negotiating drafts, for which purpose he is provided with blank bills of exchange and a letter of credit.

Purchases.—All purchases are made upon requisition by the officer in charge of the department needing the articles, and before made must be submitted to and approved by the commanding officer.

Responsibility for purchases.—The division of responsibility is in all cases as follows: the commanding officer is responsible for the necessity of the purchase; the officer requiring the articles for the quantity and quality, and their care, after receiving them; and the paymaster for their cost and arithmetical calculations on the bill.

Surveys.—In case of loss of any unusual quantity of stores in charge of paymasters, such as provisions, clothing, and small stores, to free himself from loss, the paymaster must request the commanding officer to appoint a "special" board of survey to ascertain and report the facts in the case. For ordinary loss and waste, the commander appoints a quarterly board to serve during a quarter, and report the amount and value of all ordinary waste from deterioration, etc.

Allotments.—In addition to all the regular duties, paymasters on sea-going vessels grant allotments not exceeding half-pay—unless specially authorized by the Secretary of the Navy—to all who desire it, both officers and men, to be paid to whomsoever they select at home. The allotment is paid by the nearest purchasing agent to where the person receiving the allotment resides, and the paymaster of the ship is responsible that it be checked on the rolls, and notification made of discontinuance. Blanks are furnished on requisition at the commencement of a term of duty at a purchasing agency, navy-yard, or the commencement of a cruise, for pay-rolls, bills for purchases, forms of returns, surveys, allotments, etc.; also stationery. Returns must be made as follows, viz.:

Returns and accounts.—Paymasters of "sea-going" vessels must settle their accounts each quarter as if it were final, in the mean time rendering a monthly summary statement of their accounts.

Their returns to the Treasury Department are made direct, although they must bear the approval of their immediate commanding officer, and the final or quarterly returns transmitted to the treasury must consist of—

1st. A general pay-roll embracing individual accounts of officers, men, and marines, with credits for pay and debits for money paid, money value of clothing and small stores furnished, and checkages of all kinds; also showing the dates of entry and detachment of officers, the entry, discharge, transfer, desertion, death, and expiration of the terms of enlistment of men, and the vessel or station to which officers, men, and marines have been transferred. It must be signed in a receipt column by each officer, man, and marine, and the signatures of men and marines must be witnessed in each case by an officer, and the roll itself be approved by the commanding officer.

2d. An account current showing all his receipts and expenditures, and the date of his bond, vouchers for all purchases, and contingent bills, a complete money statement of the value of all receipts and expenditures of clothing and small stores; also a full statement of all money received for provisions sold.

3d. An account of the sales of bills of exchange, with the certificate of at least two prominent merchants to the current rate of exchange at the date of negotiating every bill.

4th. All transfer accounts and rolls of officers or men, whether to or from the vessel (each officer and man on his transfer must be furnished with a duplicate statement of his account, one of which the paymaster receiving him on his roll keeps, and receipts and returns the other to the paymaster who makes the transfer).

5th. All official papers necessary to substantiate his accounts; and,

6th. The order of the commanding officer for all ratings and disratings, etc., involving increase or decrease of pay, and for all additions to pay, such as one-fourth for detainment beyond date of enlistment, for enlistments under continuous-service certificates, for honorable discharge money, for 33 cents per diem addition to men employed as firemen or coal-heavers, for money paid for transportation of officers or crew, and for entering newly-enlisted men on the rolls; and the funds appropriated being made by Congress under various appropriations, the expenditures must show under what appropriation they are made.

The returns to the paymaster-general are made through the commanding officer, and follow the official channels. They consist of—

1st. A quarterly return of provisions and contingent.

2d. A quarterly return of clothing.

3d. A quarterly return of "small stores."

4th. A duplicate copy of the account current, but without vouchers, and all receipts, invoices, surveys, etc., substantiating the above returns.

The dividing line between the Treasury and the Bureau of Provisions and Clothing is thus distinctly drawn, the one dealing purely with money values, and the other with property. A paymaster is allowed 30 days after the expiration of a quarter in which to make up and forward his returns, and at expiration of tour of duty is allowed 30, 40, 50, or 60 days, according to the duty he has been on.

In addition to these returns, an abstract of public bills must be rendered at the same time with the quarterly returns to each bureau of the Navy Department on account of which any expenditure has been made. The paymasters on shore-duty make such portions of the above returns as apply to the particular duties to which they are assigned.

Times of payment and issue of stores.—Officers are paid monthly; men receive such portions as the commanding officer directs, and are paid the balance on discharge, and workmen at navy-yards, semi-monthly.

Men receive clothing on monthly division requisitions approved by the commanding officer, and the cost is charged against them on their accounts.

Men receive small stores, including tobacco, soap, etc., on monthly mess requisitions, also approved, and value charged against them.

Officers can buy such articles as they desire at same rates.

Rations and commutation.—Provisions are served out daily, each man being entitled to one ration. Officers are not entitled to rations unless attached to a sea-going vessel. See RATION. There is a ration-table, but the ration consists in substance of one pound of meat, one of bread, one of vegetables, about a quart of coffee, and minor articles, such as butter, molasses, sugar, vinegar, pickles, etc., in proportion. Meat may be salt or canned or fresh, vegetables dry or fresh, and bread hard or soft, or simply flour, as circumstances dictate, etc., under approval of commanding officer. Canned tomatoes and dried fruits are also included.

Officers may commute their ration for 30 cents a day; men are allowed to commute two rations out of a mess of fifteen at same rate to purchase little additional articles for their benefit; and should a man be sick, he may be subsisted by the medical department, and on notification of that fact the paymaster commutes the invalid's ration at same rate for benefit of the medical department.

Hospital fund.—From the pay of each officer and man in the service a monthly sum of 20 cents is deducted for the hospital fund.

Accountability and percentage of loss.—The pay-officer is held to strict accountability for the proper care of all stores and money under his charge, but he is allowed 7 per cent. on provisions, 2 on small stores, and 1½ on clothing for necessary waste in issuing. He is also to make such other additional returns to those above mentioned as he may be called on to make for the information of his superior officers in command.

Clerical assistance.—To enable him to perform all these duties a clerk is allowed to the paymaster of all ships having a complement of 175 persons or more, to those at shore-stations, in receiving-ships, etc.; on board ship a yeoman to issue clothing, small stores, provisions, etc., is allowed, and at shore-stations additional writers, etc., according to the requirements of the different offices. Thus while there are some changes that might be desirable, the organization and accountability of the pay corps are very nearly all that could be wished. There are many other incidental duties in addition to those mentioned, which, however, are so interwoven with other departments as to come more properly under other titles.—*C. D. Mansfield, Paymaster U.S.N.*

Pea-ballast. A coarse, fresh-water sand used by ships in the China trade for stowing tea-chests upon.

Peacock-fish. A beautiful fish of the Mediterranean (*Labrus pavo* of Linnæus).

Pea-crab (*Pinnotheres*). A genus of brachyurous crustaceans with nearly circular and not very hard carapace. They are of small size, and interesting from their living within the mantle-lobes of lamelli branchiate mollusks. Species are found in almost all parts of the world.

Pea-jacket. A heavy coat worn by sea-faring men in cold weather; it is generally made of pilot-cloth.

Peak. The pee of an anchor. The outer end of a gaff. The upper after corner of a four-sided fore-and-aft sail. The contracted part of the hold, forward or aft. To raise a gaff or lateen-yard to a sharper angle with the mast. To cant the oars forward or up. See A-PEAK.

PEAK-BRAILS. The brails nearest the peak of a gaff-sail.

PEAK-HALLIARDS. The outer halliards for hoisting or lowering a gaff.

Pearl. A beautiful concretion found in the interior of the shells of many species of mollusks, resulting from the deposit of nacreous substance round some nucleus, mostly of foreign origin. The *Meleagrina margaritifera*, or pearl-oyster of the Indian seas, yields the most numerous and finest specimens.

Pecten. A kind of shell-fish.

Pectinal. A fish whose bones resemble the teeth of a comb.

Pectinibranchiata. An order of gasteropodous mollusks, having the gills composed of numerous leaflets or fringes, arranged like the teeth of a comb, and affixed to the internal surface of a cavity which opens with a wide opening above the head. The sexes are distinct. All have two tentacles and two eyes—the eyes often stalked. The mouth is produced into a proboscis, more or less lengthened. The eggs are deposited in a mass, with an envelope often of very remarkable and complicated form, which is produced by coagulation of a viscous albuminous matter secreted by a peculiar gland of the female. The order is very numerous, the greater number of gasteropods being included in it. Some have a siphon, and some are destitute of it; some have spiral, and some simply conical shells. Almost all are inhabitants of the sea or its shores, a few are found in fresh water. To this order belong Whelks, Periwinkles, Cones, Volutes, etc.

Pectoral Fins. The pair situated behind the gills of fishes, corresponding homologically to the fore limbs of quadrupeds and the wings of birds.

Pedro. An early gun of large calibre for throwing stone balls.

Pedro-pee. *To dance pedro-pee*, to walk a seam,—an old plan of testing a sailor's sobriety.

Pee. The bill of an anchor.

Peek. See PEAK.

Pegasus (named after a mythical winged horse of the Greeks). A constellation, the four principal stars of which, α, β, γ, δ, form a remarkable square; δ *Pegasi* is also called α *Andromedæ*, and the two other stars of Andromeda, β and γ, together with the adjoining β *Persei*, form, with the square of Pegasus, a group very similar to, though much more extensive than, the Great Bear lying on the opposite side of the pole. Cassiopeia lies about midway between Polaris and Pegasus. α *Pegasi* is the farthest from Andromeda and the westernmost of the constellation, and β is at the northern angle. There are two small stars, η and ξ, which are parallel to this side of the square and serve to identify it. α *Pegasi*,

Markab. *β Pegasi*, Skeat. *γ Pegasi*, Algenib. *δ Pegasi*, or *a Andromeda*, Alpheratz.

Pegasus. A genus of fishes with large pectoral fins, by means of which they take short flights or leaps through the air.

Pelagians. Fishes of the open sea.

Pelecanidæ. A family of palmiped birds (the *Totipalmati* of Cuvier) characterized by a long, straight, compressed bill, broad at the base, often with a pouch beneath the lower mandible; long wings, of which the first quill is the longest; short strong legs, and all the toes, including the hind one, united by a membrane. They are generally excellent swimmers, expert divers, and birds of powerful flight. Some of them often perch on trees, which few other web-footed birds do. To this family belong pelicans, cormorants, frigate-birds, tropic-birds, and darters.

Pelican. A well-known water-bird. Also, the old 6-pounder culverin.

Pemblico. A small bird whose cry was deemed ominous at sea as presaging wind.

Pemmican. Condensed venison, or beef, used by the hunters around Hudson's Bay, and largely provided for Arctic voyages, as containing much nutriment in a small compass. Thin slices of lean meat are dried over the smoke of wood fires; they are then pounded and mixed with an equal weight of their own fat. It is generally boiled and eaten hot where fire is available.

Penang-lawyer. A cane with a very large round head, common in Penang and on the Malay Peninsula.

Pencel. A small streamer or pennon.

Penchute. A chute which conducts the water from a race to a water-wheel.

Pendant. A short piece of rope having generally a thimble or block in one end; as, brace-pendants, mast-head pendants, reef-pendants, etc. See PENNANT.

PENDANT, IRISH. The loose end of a rope, gasket, etc., hanging about the rigging or sails.

PENDANT-TACKLE. A heavy tackle, the upper block of which is hooked into the lower mast-head pendant.

Pendulum. See GUN-PENDULUM.

Penguin (*Aptenodytes*), a genus of birds of the family *Alcidæ*, and divided into several genera and sub-genera. The body is of an elliptical form, the neck of moderate length, the head small, the bill moderately long, straight, and more or less compressed. The tail is very short. Some of them have a long, slender, and pointed bill, the upper mandible a little curved at the tip, and feathered for about a third of its length. Some, sometimes called Gorfews or Gorfous (*Chrysocoma*), have a stout and pointed bill, a little curved at the tip; others, Sphenisques (*Spheniscus*), have a straight and compressed bill, irregularly furrowed at the base. The wings, too short for flight, are covered with short, stiff, scale-like feathers, and are admirably adapted for swimming. The legs are very short, and are placed far back, so that on land penguins rest on the tarsus, which is widened like the sole of the foot of a quadruped, and stand perfectly erect. Their bones, unlike those of birds in general, are hard, compact, and heavy, and have no air-cavities; those of the extremities contain an oily marrow. Penguins are found only in the southern hemisphere, and chiefly in high southern latitudes.

Peninsula. A body of land nearly surrounded by water, but joined to the mainland by a narrow neck, called an isthmus.

Penknife-ice. A name given by Parry to ice the surface of which is composed of numberless irregular vertical crystals, from 5 to 10 inches long, about half an inch broad, and pointed at both ends. It is supposed to be produced by heavy drops of rain piercing their way through the ice rather than by any peculiar crystallization while freezing.

Pennant. A *narrow-pennant* is worn by all government vessels in commission and commanded by an officer below the grade of commodore. This pennant is not an emblem of rank, but signifies that the vessel flying it is of a public character. It is worn at the main.

A *broad-pennant* is the distinctive mark of a commodore; it is of blue bunting, swallow-tailed, contains one white star, and is worn at the main. When two or more commodores are in company the senior wears the blue, the next in rank the red, and the other or others the white pennant.

A *senior officer's pennant* is worn at the mizzen. Pennants are much used in signaling. See SIGNALS.

PENNANT-SHIP. A vessel commanded by a commodore.

Pennock. A little bridge thrown over a water-course.

Penny-widdie. A haddock dried without being split.

Pensacola is a port of entry and the capital of Escambia County, Fla. It is situated on the west shore of Pensacola Bay, 10 miles from the Gulf of Mexico. The harbor has 20 feet of water on the bar, and is one of the safest in the Gulf of Mexico. At the entrance of the harbor are situated Forts Pickens and McRae, and at Warrington, 7 miles to seaward, the U. S. navy-yard and Fort Barrancas are situated. Steamers ply regularly between Pensacola, New Orleans, and Havana. See NAVY-YARD.

Pensions, Navy. Payments by the United States to persons disabled in the naval service, or marine corps, and to the dependents of persons killed, or who have died in consequence of injuries received in such service.

Any person disabled by wounds received or disease contracted in the naval service, or the marine corps, while in the line of duty, and who has been honorably discharged; and any master serving on a gunboat, or any pilot, engineer, sailor, or other person not regularly mustered, serving on any gunboat or other war-vessel of the United States, disabled by such service from procuring subsistence by manual labor, is entitled to a pension. Any enlisted man who has served 20 years in the navy or marine corps and is disabled by age and infirmity, or any enlisted person who has served 10 years and is disabled, on recommendation of a board of 3 naval officers may receive aid from the navy pension fund. (See NAVY PENSION FUND.) No person is entitled to a navy pension for disabilities received subsequent to July 27, 1868, unless he was at the time in the line of duty and was borne on the books of some vessel of the United States, at sea or in a harbor, actually in commission, or was at some naval station, or on his way by authority to the United States, or to some other vessel, or

naval station, or hospital. Loyalty is essential in all cases.

The following are the monthly rates of pensions for total disability: Lieutenant-colonel and higher officers in the marine corps, captain and officers of higher rank, commander, surgeon, paymaster, and chief engineer ranking with commander, lieutenant commanding and master commanding, \$30. Major, marine corps, and lieutenant, surgeon, paymaster, and chief engineer ranking with lieutenant and passed assistant surgeon, \$25. Captain, marine corps, and professor of mathematics, master, assistant surgeon, assistant paymaster, and chaplain, \$20. First lieutenant, marine corps, and acting assistant surgeon, \$17. Second lieutenant, marine corps, and first assistant engineer, ensign, and pilot, \$15. Cadet midshipman, passed midshipman, midshipman, clerk, master's mate, and warrant-officer, \$10. All other persons, \$8. After March 3, 1877, pensions of passed assistant engineers, assistant engineers, and cadet engineers in the naval service are the same as pensions allowed officers of the line, with whom they have relative rank. The rate of pensions for other than total disability is governed by the extent of the disability.

The laws and regulations relating to the following matters are the same for navy as for army pensions, viz.: the rate of pension for permanent specific disability; the time when the right to a pension accrues; the rights of widows, children, and other dependents of deceased officers and men; artificial limbs, or money in lieu thereof; places and times of payment of pensions; and the manner of applying for and obtaining all benefits under the pension laws.

Whenever any person entitled to a navy pension is admitted to a navy hospital or to the Naval Asylum, his pension during his continuance in the hospital is paid to the Secretary of the Navy and returned to the navy pension fund.

Pension Fund, Navy. A fund derived from the government's share of money obtained from the sale of prizes captured by U. S. vessels. (See Prize-money.) It is provided by law that money so accruing shall be and remain forever a fund for the payment of pensions to officers, seamen, and marines who may be entitled to receive the same; and if such fund be insufficient for the purpose, the public faith is pledged to make up the deficiency; but if it should be more than sufficient, the surplus shall be applied to the making of further provision for the comfort of the disabled officers, seamen, and marines. The Secretary of the Navy is trustee of the fund, which now amounts to \$14,000,000, and is invested in government securities paying 3 per cent. interest.

Any enlisted man who has served 20 years in the navy or marine corps, and is disabled by age or infirmity, may, if he so elects, receive a sum from the pension fund, equal to one-half the pay of his rating at the time of his discharge, to be paid quarterly by a pension agent. This is in lieu of being provided with a home in the Naval Asylum at Philadelphia. Applications for this pension must be made to the Secretary of the Navy, who, if satisfied the applicant is entitled thereto, will direct the Commissioner of Pensions to issue a certificate.

Every disabled person who has served 10 years in the navy or marine corps, and has not been discharged for misconduct, may apply to the Secretary of the Navy for aid from the pension fund. A board of 3 officers will examine the condition of the applicant, and recommend a suitable amount for his relief, to be paid quarterly, for a specified time. If the Secretary approve the recommendation, the Commissioner of Pensions will issue a certificate to the applicant; but the allowance cannot exceed the rate of a pension for full disability corresponding to the grade of the applicant, nor, if in addition to a pension already in the receipt of the applicant, exceed one-fourth the rate of such pension.

Penumbra. A partial shadow. The shadow, in an eclipse, from which the light is not wholly cut off by the intervening body.

Peotta. A craft of the Adriatic, of light burden, propelled by oars and canvas.

Pepper-dulse. *Halymenia edulis;* a pungent sea-weed, which, as well as *H. palmata*, common dulse, is eaten in Scotland.

Perca. A genus of fishes including the perch.

Perch. A pole stuck up on a shoal as a beacon. A spar erected on or projected from a cliff whence to watch fish. An acanthopterygious fish of several species, of the genus *Perca*, inhabiting both fresh and salt water. They have powerful dorsal fins, with strong and sharp spines. The scales are moderately large, with the posterior edge toothed. The name is also applied to several other species of fishes. The common perch of eastern North America is the *Labrax rufus;* the yellow perch, *Perca flavescens.* The black perch of the American seas is the *Centropristis nigricans*, called also *sea-bass.* The blue perch is the *Ctenolambrus cœruleus* of the *Scomber* family.

Percussion-fuze. See Fuze.

Perer. An old gun for throwing stone shot.

Periagua. See Piragua.

Perigee (Gr. *peri*, near; *gē*, the earth). The point in the moon's orbit nearest the earth.

Perihelion (Gr. *peri*, near; *hēlios*, the sun). The point in the orbit of a planet or comet nearest to the sun.

Periko. An undecked boat of burden in Bengal.

Perils of the Sea. A term comprehending the accidents peculiar to ocean navigation which are insured against in policies of marine insurance. In England and in this country a specification of the risks is an essential part of the contract. In most of the countries of Europe, where there is no special agreement of the parties, the perils that the policy is to cover are defined by law

Periodical Winds. See Monsoon.

Periwinkle. A favorite little shell-fish, the pin-patch, or *Turbo littoreus.* The *win-wincle* of the Anglo-Saxon.

Perpendicle. The plumb-line of the old quadrant.

Perry. An old term for a sudden squall.

Perry, Christopher Raymond, Captain U.S.N. Born in Rhode Island, 1760; died at Newport, June 8, 1818. He served with distinction in the Revolutionary navy; was in the hard-fought action of the "Watt" and the "Trumbull," and was for some months confined in the "Jersey" prison-ship; post-captain, January 7, 1798. April 3, 1801, the navy was nearly disbanded, and Capt. Perry was appointed collector of New-

port. His five sons (Oliver H., Raymond H., Matthew C., James A., and Nathaniel H.), all officers of the navy, distinguished themselves during the war of 1812–15. A daughter, Anna Maria, married Capt. George W., son of Commodore John Rodgers, and died at New London, Conn., December 7, 1858, aged 60.

Perry, Matthew Colbreath, Commodore U.S.N. M. C. Perry, son of Capt. C. R. Perry, and brother of Oliver H. Perry, U.S.N., was born at South Kingston, R. I., in 1795. He entered the navy as midshipman in 1809, on the 1st of March. During the war of 1812 he served in the squadrons of Commodores Rodgers and Decatur. Promoted to lieutenant on the 24th of July, 1813. In 1817–19, he was at New York Navy-Yard. In 1820, in the sloop "Cyane," African coast, and the following year also. In 1822–23 he was in command of the schooner "Shark," in the West India Squadron, cruising against pirates. In 1824, he was in the receiving-ship at New York; 1825, went to the Mediterranean as first lieutenant of the "North Carolina," 74, and returned home in 1827; from 1828 to 1830, he was at the naval rendezvous at Charleston; in 1831–33, sloop "Concord"; attached to the navy-yard, New York, in 1835–37. Commissioned as master-commandant, March 21, 1826, and captain in 1837; in 1838–40, in command of the U. S. ship "Fulton," in connection with experiments in steam navigation, and in Europe on light-house duty; in 1841–43, he was at the navy-yard, New York, part of the time in command; in 1844–45 he commanded the African Squadron; in 1846, joined the squadron under Commodore Connor in the steamer "Mississippi"; in 1846, conducted the expedition against Tabasco, in October, capturing several ships and two towns, and afterwards against Laguna; he was left in command March 21, 1847, and so continued until the end of the Mexican war, conducting all the operations against Vera Cruz, in March, Tuspan, in April, and Tabasco, in June; he was on special duty from 1849 to 1852, and in 1853 sailed in command of the East India Squadron, and during the three succeeding years carried the flag into Japanese waters, and successfully made with them the treaty which opened their ports to American enterprise. He was on special duty connected with that expedition during the years 1856–57, and on waiting orders in 1858. He died on the 4th of March, 1858, at New York, aged 63.—*F. S. Bassett*, *Lieutenant U.S.N.*

Perry, Oliver Hazard, Commodore U.S.N. Oliver H. Perry, son of Capt. Christopher R. Perry, was born in Newport, R. I., in August, 1785. He as a midshipman in his father's vessel, the "General Green," received a warrant April, 1799. Sailed in the "John Adams," Capt. Rodgers, in September, 1802, and served in her in the war with Tripoli, being promoted to acting lieutenant at 17 years of age. Returning, he sailed again for the Mediterranean in the "Constellation," Capt. Campbell, in 1805, and was transferred to the "Nautilus" as first lieutenant, and came home in the "Essex." Commissioned a lieutenant January, 1807. Had command of 17 gunboats in New York harbor in 1809. In 1810 commanded the schooner "Revenge," in Commodore Rodgers's squadron. While surveying the coasts of New England he was wrecked on Watch Hill Reef, Conn., January, 1811. In consequence, he was court-martialed, but acquitted of the charges. In command of flotilla at Newport, but was transferred to the lakes, in 1812, and promoted to master-commandant. He led the boats in Commodore Chauncey's attack on Fort George, 27th May, 1813. He had been assigned to the command of the forces on Lake Erie, and returned there after this action. By great exertions he assembled a fleet, and on the 10th of September, defeated the English squadron of 6 vessels, in the celebrated battle of Lake Erie, off Put-in-Bay. His ship, the "Lawrence," was so battered that he abandoned her during the action, going in a boat to the "Niagara." On his flag was inscribed the dying sentence of Lawrence, "Don't give up the ship." He received a gold medal for this victory. He resigned the command to Capt. Elliott, November 20; was appointed a captain September 10, and given command of the "Java," 44. That vessel being blockaded, he was ordered to superintend the construction of a squadron of gunboats. Returning to the "Java," he went to Algiers in Decatur's squadron. In 1819, sailed in the "John Adams" to command the Brazil Station. Sailed up the Amazon River in the schooner "Nonsuch" to Angostura, was attacked with the yellow fever, and died August 23, aged 34 years, on his return to Port Spain, Trinidad.—*F. S. Bassett*, *Lieutenant U.S.N.*

Perseus (named after a mythical hero, the slayer of Medusa). A constellation lying between Auriga and Taurus on its east, and Cassiopeia and Andromeda on its west. Of its two principal stars, *α* lies nearly between Capella and Cassiopeia, *β* forms a triangle with Capella and the Pleiades. *α Persei*, Mirfak. *β Persei*, Algol. The latter star is remarkable for its periodic changes of magnitude.

Personal Error, or Personal Equation. Different individuals have their peculiarities which materially affect the observations made by them. The organ of vision is more refined and specially educated in one person than in another, and the forming a judgment of the exact instant of a phenomenon is greatly influenced by the temperament of the observer. The error arising from this cause is called the *personal error*, or, with reference to the consequent correction to be made to an observation, the *personal equation*. Even when two images in contact are at rest before two observers, one will decide that they overlap, and the other that they are apart; but especially when the images are in motion does such difference of opinion occur. Anxiety lest he should miss the observation may lead a nervous observer to think he sees the contact before it really takes place, while quickness of perception may be deficient in another observer.

Personnel. A word adopted from the French, and expressive of all the officers and men, civil and military, composing an army or a naval force.

Persuader. A rattan, colt, or rope's end in the hands of a boatswain's mate.

Perth, formerly the metropolis of Scotland, is situated on the right bank of the river Tay, in lat. 56° 23′ 50″ N., lon. 3° 26′ 20″ W. The river is navigable to the city for vessels of considerable burden. Ship-building is an extensive interest, and the salmon-fisheries of the Tay are very valuable. The foreign trade is unimportant,

but the coastwise exports include, besides fish, large quantities of potatoes, corn, timber, and slates. Pop. 27,000.

Perturbations. Irregularities or inequalities in the motion of a heavenly body in its orbit.

Peru, Navy of. The list of vessels at present comprises 2 single-turreted monitors, 2 gun-vessels, 1 unarmored corvette, 4 transports, and 3 school-ships. Their most formidable vessel, the "Huascar," was captured by the Chilians, October 8, 1879. The "Atahualpa" and the "Manco Capac" (since sunk by the Chilians at Arica, June 14, 1880) were built for the U. S. navy in 1866, at Cincinnati, O., and sold to Peru in 1867.

The "Victoria" and "Loa" are small gun-vessels, mounting 2 guns each. The unarmored vessels include the wooden corvette "Union" and the transports "Chalco," "Limena," "Oroya," and "Talisman." The "Independencia," lost in 1879 by running on a rock while in chase of the Chilian gunboat "Covadonga," was an iron-armored frigate of the old type, built in England in 1865.

Petard. A bell-shaped vessel filled with powder, and fired by a fuze, formerly used for breaking down gates, barricades, etc. *Hoist by his own petard*, a phrase descriptive of the case of one whose machination against another has re-acted to his own injury.

Pet-cock. A tap or valve on a pump. A faucet on a cylinder.

Peter-boat. A fishing-boat of the Thames and Medway, so named after St. Peter, as the patron of fishermen, whose cross-keys form part of the armorial bearings of the Fishmongers' Company of London. These boats were first brought from Norway and the Baltic. They are generally short, shallow, and sharp at both ends, with a well for fish in the centre, 25 feet over all, and 6 feet beam; yet in such craft boys were wont to serve out seven years' apprenticeship, scarcely ever going on shore.

Peter's-fish. A haddock; so named because the spots on either side are supposed to be the marks of St. Peter's fingers, impressed indelibly when he caught that fish to pay the tribute.

Petrel. The *Cypselli* of the ancients, and *Mother Carey's chicken* of sailors. They collect in numbers at the approach of a gale, running along the waves in the wake of a ship, whence the name *petrel*, in reference to St. Peter's attempt to walk on the water. They are seen in all parts of the ocean. The largest of the petrels, *Procellaria fuliginosa*, is known by seamen as *Mother Carey's goose*.

Petticoat Trousers. A kind of kilt formerly worn by seamen in general, but latterly principally by fishermen.

Petty Average. See AVERAGE.

Petty Officer. A general term, corresponding to *non-commissioned officer* in the army. He holds his position during the pleasure of the appointing authority, which is generally the commanding officer. The master-at-arms is the chief petty officer.

Phalarope (*Phalaropus*). A genus of birds of the family *Lobipedidæ*, having a rather long, slender, weak, straight bill, resembling that of the sandpipers, which, indeed, they otherwise much resemble, although differing in their aquatic habits, the greater part of their time being passed in swimming on the sea, where they seek mollusks and other small marine animals for their food. The gray phalarope breeds only in the Arctic regions, but migrates southward on the approach of winter. It is a beautiful bird, and remarkable for the great difference of its summer and winter plumage, the prevailing tint in winter being a delicate gray, whilst in summer the upper parts exhibit a fine mixture of black, white, and yellow, and the breast and under parts are a reddish chestnut. Its entire length is rather more than 8 inches. The red-necked phalarope breeds in some of the northern Scottish islands, although it is more common in more northern regions. It is rather smaller than the gray phalarope, between which and it Cuvier makes a generic distinction, on account of its sharper and more slender bill. Both are very fearless of man and easily tamed. Their flesh is oily and unpalatable.

Pharos. An island near Alexandria on which a light-house was erected; hence, a name for any light-house.

Phaselus. An ancient small vessel, equipped with sails and oars.

Phases. The different forms which the illuminated disks of the moon and some planets assume in consequence of their being turned at different angles to the observer.

Phecda. The star γ *Ursæ Majoris*.

Phelps, Thomas S., Commodore U.S.N. Born in Maine. Appointed from Maine, January 17, 1840; attached to sloop "Preble," coast of Labrador and Bay of Fundy, March to December, 1840; Mediterranean Squadron, January, 1841, to September, 1843; sloop "Boston," Brazil Squadron, October, 1843, to February, 1846; Naval School, February to July, 1846.

Promoted to passed midshipman, July 11, 1846; sloop "Boston," Gulf Squadron, October 5, 1846; wrecked on the island of Eleuthera, West Indies, November 16, 1846; detached and ordered to steamer "Polk," for war and special service; in Mexico, February 20, 1847; returned detached, and ordered to coast survey, May 7, 1847; attached to schooners "Nautilus," "J. T. Mason," and steamer "Legare," until June, 1849; razee "Independence," Mediterranean Squadron, June, 1849, to December, 1850; frigate "Constitution," same squadron, December, 1850, to February, 1851; schooner "Graham," steamers "Legare" and "Hetzel," coast survey, May 1, 1851, to November, 1852; receiving-ship "Pennsylvania," November, 1852, to January 1, 1853; steamer "Fulton," one month,—rejoined "Pennsylvania," and attached until December, 1853; surveyed Elizabeth River and Norfolk Navy-Yard; sloop "Decatur," Pacific Squadron, December, 1853, to April 15, 1857; served throughout the Indian war in Washington Territory, 1855–56.

Promoted to master, March 1, 1855.

Commissioned as lieutenant, September 14, 1855; battle of Seattle, Washington Territory, January 26, 1856; ordnance duty, Norfolk, Va., May, 1857, to September, 1858; Paraguay Expedition and Brazil Squadron, September, 1858, to June, 1859; steamer "Crusader," Home Squadron, June 16 to August 24, 1859; commanded steamer "Vixen," coast survey, and on special service, August, 1859, to September, 1861; attached to expedition for the relief of Fort Sumter,

March, 1861. "In organizing the government for war, it was decided by the chiefs of departments that one naval officer skilled in surveying should be detached for special service to co-operate with army and navy, and Lieut. Phelps was selected by ballot for that duty." In consequence of the destruction of signs, boats, buoys, and ranges, and the erection of heavy batteries by the rebels, the Potomac River was rendered almost impassable, and at this critical moment when the safety of Washington was hazarded, a survey and chart of the river became imperative. For this purpose, 6 steamers were placed at the disposal of Lieut. Phelps. Selecting two, he, in June, successfully executed the work, which fully answered the requirements of the country. Transferred to steamer "Corwin" for secret service, September 24, 1861; examined five of the inlets of North Carolina, and surveyed and buoyed Hatteras Inlet, for the introduction of expeditions into the interior waters of that State; skirmished with rebel gunboats, Pamlico Sound, November 9, 1861; engagement with rebel gunboat "Curlew," Hatteras Inlet, November 14, 1861; received compliments of Secretary of Navy; secret service in Virginia waters, December, 1861; attached to North Atlantic Blockading Squadron, March, 1862; assigned to command of division for operations in rear of Gloucester Point, Va., April 1, 1862; York River, April 21, three engagements with Yorktown and Gloucester Point batteries; skirmish with rebels, Queen's Point, Va., captured 5, and caused the destruction of 2 of the enemy's vessels; prevented destruction of White House bridge, May 4, 1862; frequent skirmishes with main body of rebel army retreating from Yorktown, May 5 and 6; battle of West Point, Va., ascended the Mattapony River and prevented the junction of a large force of rebels with main army, May 7; made reconnoissance charts of Mattapony and Pamunkey Rivers.

Commissioned as lieutenant-commander, July 16, 1862. In obedience to the demands of Congress and an order of the Navy Department, executed a close and complete survey of the Potomac River; opposed in the work by enemy's infantry and artillery, July 29, 1862, to March 1, 1863; commanded steamer "Corwin," on special service, from March, 1863, to December, 1864,—principally employed in making surveys in anticipation of naval and military movements, and in examining dangers in the way of blockaders and transports; ironclad "Saugus," December, 1864; steam-sloop "Juniata," January 3, 1865; commanded the "Juniata" at the capture of Fort Fisher, January 15, 1865; South Atlantic Blockading Squadron, January 21, 1865; commanded steamer "Lenapee," Atlantic Coast Squadron, March 2, 1865, to April 3, 1867.

Commissioned as commander, August 5, 1865; Mare Island Navy-Yard, Cal., 1867–70; commanding receiving-ship "Independence," 1870–71; commanding steam-sloop "Saranac," North Pacific Station, 1871–72.

Commissioned as captain, June 19, 1871; navy-yard, Mare Island, Cal., 1873–77; commanding receiving-ship "Independence," 1877–79.

Commissioned as commodore, January 13, 1879; waiting orders, 1880.

Philadelphia, the second city of the United States and the metropolis of Pennsylvania, is situated on the Delaware River, 96 miles (by ship-channel) from the ocean. The water front on the Delaware reaches from Poquessing Creek to Bow Creek, opposite Tinicum Island, and is 23 miles long. The area of the city, including Germantown, Chestnut Hill, Frankford, Manayunk, and many smaller suburban towns, is 129 square miles. The city is divided into two parts by the Schuylkill River, that part lying west of the river being called West Philadelphia. The principal government buildings located here are the Naval Asylum, naval hospital, Frankford and Schuylkill arsenals, custom-house and sub-treasury, and post-office. The navy-yard is situated at League Island, south of the city, and at the end of Broad Street, about 5 miles from Market Street. The city is accessible from the sea by the largest merchant steamers, and several lines of steamships ply between Philadelphia and European ports. A number of large railroads centre here, and the city takes a high rank as a seat of foreign, domestic, and coastwise trade; coal, petroleum, live-stock, lumber, grain, iron and iron goods, machinery, cotton (raw and manufactured), and tobacco are the leading articles of export. Girard Point, on the Schuylkill, is the grain and provision shipping-point. Port Richmond, on the Delaware, is the coal port, and Gibson's Point, on the Schuylkill, and Greenwich Point, on the Delaware, have all the necessary appliances for the shipment of both petroleum and coal. The only transatlantic line of steamers carrying the American flag plies between Liverpool and Philadelphia. The manufactures of this city constitute its largest business interest. Some idea of its vastness can be formed from the following figures: The amount of capital invested is $250,000,000; number of hands employed, 220,000; amount paid in wages, $88,000,000, and the value of a year's product, $500,000,000. The textile interests employ more than 70,000 persons, and produce more than $85,000,000. The other leading manufactures are iron and steel, machinery, refined sugar, house-building materials, boots and shoes, etc. The population by the census of 1880 is 847,572.

Phinak. A species of trout.

Phœnix (named after a mythical bird of the Egyptians). A constellation the principal star of which, *α Phœnicis*, is situated midway between Fomalhaut and Achernar, nearly on the line joining them.

Physalia. A genus of *Acalephæ.* Under the name of *Portuguese man-of-war* this creature is well known to sailors, with whom it is a common trick to induce a green hand to pick up one of them for the fun of witnessing the promptitude with which he lets go of it, owing to a power it possesses of inflicting a sting that not only causes severe local pain, but also constitutional irritation.

Piaba. A small, fresh-water fish of Brazil, about the size of a minnow, much esteemed for food.

Piccaroon. A swindler or thief. Also, a piratical vessel.

Piccary. Piratical theft on a small scale.

Pickerel. A fish of the genus *Esox*, applied to several species of fresh-water fish belonging to the pike family.

Pickerie. An old word for stealing; under this name the crime was punishable by severe duckings.

Pickering, Charles W., Commodore U.S.N. Born in New Hampshire, from which State he was appointed midshipman, May 22, 1822. In 1822–23, sloop "Cyane," stationed on the coast of Africa, lost by fever 50 of her officers and crew. On leave, 1824–26; Naval School, New York, 1827; in 1828, attached to sloop-of-war "Erie," West India Station; from the summer of 1831 to February, 1834, was attached to the sloop-of-war "Falmouth," Pacific Squadron.

Promoted to passed midshipman, June, 1833; serving at navy-yard, Boston, during the years 1835–36; from 1837–39, attached to frigate "Fulton," stationed on the U. S. coast.

Commissioned as lieutenant, December 8, 1838; from 1840–42, attached to sloop "Yorktown," Pacific Squadron; from 1844–45, executive-officer of the sloop "Preble," West India and African Squadrons; attached to navy-yard, Portsmouth, N. H., 1846–47; in 1848–49, attached to sloop-of-war "St. Mary's," Pacific Squadron; commanding the sloop-of-war "Warren," Pacific Squadron, during the years 1850–51; in 1854, served as executive-officer of the sloop "Cyane," which vessel took out the Darien Expedition under Lieut. Strain, who lost 7 of his men by starvation. Lieut. Pickering, in his search for that party, was within 4 hours' march of the head-waters of the Chaquenaque, the course of which it was his intention to follow, when he was apprised by Indian runners of the arrival of Lieut. Strain and party at Chapagana, Pacific side. After landing Lieut. Strain with the remainder of his party at New York, the "Cyane" was ordered to Greytown, Nicaragua, which town, in pursuance of redress, was reduced to ashes after a bombardment of 4 hours; only one house was left standing. In 1855–57, attached to navy-yard, Portsmouth, N. H.

Promoted to commander, September 14, 1855; in 1859–61, inspector of the seventh light-house district, headquarters at Key West.

Commissioned as captain, July 15, 1862; in 1862–63, commanding steam-sloop "Kearsarge," Mediterranean and Western Islands; in 1863–64, commanding steam-sloop "Housatonic," which was blown up off Charleston on the night of February 17, 1865, by a submarine torpedo. As soon as recovered from wounds received on board the "Housatonic," took command of the steamer "Vanderbilt," which vessel participated in the capture of Fort Fisher. Detached from "Vanderbilt" in August, 1865, and ordered to Portsmouth Navy-Yard; detached from Portsmouth Navy-Yard, February, 1867, when he was placed upon the retired list at his own request.

Commissioned as commodore in 1871.

Pickle-harin. A sea-sprite.

Pickling. A mode of salting naval timber in dock-yards, to insure its durability.

Pictarnie. A name for the *Sterna hirundo*, tern, or sea-swallow.

Pictor. See CONSTELLATION.

Pictou, Nova Scotia, is situated at the head of Pictou harbor, which opens into Northumberland Strait. The annual export of coal from this place is very large, and considerable building-stone is also shipped from here. The harbor is one of the finest on the Gulf of St. Lawrence, and the town is very well built, and contains several tanneries, saw-mills, iron-foundries, carding-mills, and tobacco-factories.

Piece of Eight. The early name for the coin of the value of 8 reals, the well-known Spanish dollar.

Pier. A mole or jetty extending out in the water, for the convenience of vessels receiving and landing cargo or passengers. A pillar supporting a bridge.

Piggin. A little pail having a long stave for a handle; used to bail water out of a boat.

Pig-tail. The common twisted tobacco for chewing.

Pig-yoke. A familiar name for a quadrant or sextant.

Pike. A fish of the genus *Esox*, so named from its length and shape, or from the form of its snout. It is a fresh-water fish, living in deep water.

Pilchard. A fish of the genus *Clupea*, resembling the herring, but thicker and rounder, having the under jaw shorter, the back more elevated, and the belly not so sharp. These fishes are caught on the Cornish coast, in England, about the middle of July, in immense numbers, and furnish a considerable article of commerce.

Pile. A spar pointed at one end and driven into soil to support a superstructure.

PILE-DRIVER. A machine adapted for driving piles. Also, applied to a ship given to pitch heavily in a sea-way.

Pillar of the Hold. A main stanchion with notches for descent and ascent.

Pillaw. A dish composed of junk, rice, onions, and fowls; it figured at the marriage feast of Commodore Trunnion. It is derived from the Levantine *pillaf*.

Pillow. That part of a pillow-block or bearing which contains the lower brass of a journal. A block of timber upon which the inner end of the bowsprit was formerly supported.

PILLOW-BLOCK. See PLUMBER-BLOCK.

Pilot. A person specially deputed to conduct ships into and out of port, along the coast, and in other places where navigation is dangerous. The intricacy of almost all coast navigation renders it impossible that any navigator, however skillful, can be acquainted with all the waters to which he may have to sail his ship; the risk of accident, through ignorance of local danger, is avoided by taking a pilot. The pilot, to whom so much is intrusted, must be a person competent and reliable, and all maritime countries grant licenses to qualified seamen to act as pilots in a certain district. Pilots are associated in companies, the profits being distributed according to local regulations. Pilots are sometimes found at a distance of several hundred miles from port; their boats are distinguished by a flag, and by a number painted conspicuously on the sails. Pilot regulations vary in different ports; in some, pilotage must be paid whether a pilot be taken or not; in others, the employment of a pilot is optional with the master of the vessel. It is the practice in the navy to employ a pilot, even when the commanding officer and navigator are familiar with the local dangers, the object being to assist the pilots in maintaining an effective force.

PILOTAGE. The compensation allowed to a pilot.

PILOT-BOAT. A handy sharp-built boat used by pilots.

PILOT-BIRD. A bird of the Caribbee Islands,—so called because its presence indicates to mariners the vicinity of land.

PILOT-BREAD. Sea-biscuit; hard bread.

PILOT-CLOTH. A heavy cloth used for pea-jackets.

PILOT-FISH. A fish of the family *Scomberidæ*, in shape very similar to the mackerel. It is about a foot in length, the color being a silvery grayish blue, with fine dark blue bands passing around the body; its flesh is delicate and resembles the mackerel in flavor. It is supposed to be the Pompilius of the ancients, which was believed to point out the desired course to sailors. It is often seen in company with a shark, and is therefore very commonly supposed to direct the shark to its prey. Concerning this many stories are told by both navigators and naturalists. On the other hand, it has been contended that the pilot-fish merely follows the ship to feed on whatever may be thrown overboard; or that it attends the shark in order to seize small morsels of its large prey.

PILOT-WATER. The limits within which usage or law requires a ship to pay pilotage.

Pinch-bar. A lever with a fulcrum close to the point; it is used in moving very heavy articles.

Pinching-pin. A pin used to keep a slide-valve from rising off its seat.

Pinion. The smaller of two toothed wheels in gear, used as a driver to diminish speed, and as the driven to increase speed; and with a rack to convert rotary motion into rectilinear, or *vice versa*.

Pink. A ship with a very narrow stern, having a small square part above. The shape is of old date, but continued, especially by the Danes, for the advantage of the quarter-guns, by the ship's being contracted abaft. Also one of the many names for the minnow,—so called from the color of its abdomen in summer.

PINK-STERNED. Having a very narrow stern.

Pinnace. Originally a small vessel propelled by sails and oars, usually schooner-rigged, and employed as a tender to large vessels. The armed pinnace of the French coast was of 60 to 80 tons burden, carrying one long 24-pounder and 100 men. The name is now given to a double-banked carvel-built row-boat, and is also applied to a person of low habits.

Pin-rail. A timber bolted to the interior of the bulwarks at a convenient distance from the deck, and having a number of belaying-pins to which the running rigging is secured.

Pintail, or Pintail Duck. A duck about the size of the mallard, with a brown head and tapering tail. It is found in all polar regions, and migrates southward during winter.

Pintle. A composition bolt having straps attached to secure it to the rudder; the bolt rests in the braces fixed upon the stern-post.

Pipe. A tube to convey steam, water, or other fluid. A boatswain's call. To wind a boatswain's call. *To pipe the eye*, to weep.

PIPE-COUPLING. An adjustable joint for the convenience of taking down pipe or renewing portions.

Pipe-clay. A substance used for whitening the belts of the marines. It should be free from iron.

Pipe-fish. A genus of osseous fishes of the order *Lophobranchii* and of the family *Syngnathidæ*. The form is elongated, there is little flesh, and the body is almost covered with partially ossified plates. The males have pouches in which they receive the eggs of their mate, and carry them till they are hatched. They are commonly 12 to 16 inches in length. The name is sometimes given to the *flute-mouths*.

Piper. A half-dried haddock. The shell *Echinus cidaris*. Also, the fish *Trigla lyra*.

Piracy. See INTERNATIONAL LAW, 8.

Piragua. See PIROGUE.

Pirate. One who traverses the seas for the purpose of robbing; a freebooter. The vessel of such a rover is also called a pirate. The pirate is the enemy of mankind, and is punishable under the law of nations by any competent tribunal in any country where he may be found or into which he may be brought. The armed cruisers of all nations are bound, in the common interest of humanity, to attack and capture or destroy him. A distinction is to be observed between the pirate recognized as such by the law of nations and one made such by the municipal law of individual states. Of the former it may truly be said, "his hand is against every man, and every man's hand is against him;" but the latter may be innocent of any offense against public law, and yet be amenable to the pains and penalties of piracy under the municipal law of his own country. See INTERNATIONAL LAW, 8.

Pirie. An old term for a sudden gust of wind.

Pirogue, or Piragua. A canoe formed from the trunk of a large tree, generally cedar or balsa wood. It was the native vessel which the Spaniards found in the Gulf of Mexico, and on the west coasts of South America; called also a *dug-out*.

Piscary. A legal term for a fishery. Also, a right of fishing in the waters belonging to another person.

Pisces. The twelfth sign of the zodiac. A constellation to the eastward of Pegasus, without any notable stars.

Piscis Australis (*Lat.* "The Southern Fish"). A constellation to the south of Aquarius, containing the brilliant star called *Fomalhaut*. A line through β and α Pegasi, continued a little more than twice their distance, gives the position of α *Piscis Australis*, or *Fomalhaut*.

Piscis Volans. See CONSTELLATION.

Pistol-proof. A term for the point of courage for which a man was elected captain by pirates.

Piston. A cylindrical piece of mechanism which fits the cylinder of a steam-engine or pump and is capable of reciprocation, and in the former case is the means of converting pressure into rectilinear motion, the action being reversed in the case of the pump; that is, in the one case the fluid gives motion to the piston, and in the other the piston gives motion to the fluid.

PISTON-HEAD. The body of a piston on which the packing-rings and springs rest.

PISTON-HEAD VALVE. A valve in the head of a piston; usually to admit steam to the inside of the piston to press out the packing-rings in case of steam-packing.

PISTON-PACKING. Means of preventing the leakage of steam, water, etc., between the piston and the cylinder in which it works; in the steam-engine it is usually composed of metallic rings; in pumps, braided hemp, cotton, and wire are common, as well as many patented kinds.

PISTON-ROD. The rod connecting the piston

to the cross-head, or, as in the case of the oscillating-engine, to the crank-pin.

PISTON-VALVE. A cylindrical slide-valve (not rotary); either a solid or packed piston may be used, and there is usually one for each end of the cylinder. They act by sliding back and forth over the parts, admitting steam from between them and exhausting beyond them.

Pitch. The distance between the centres of two adjacent threads of a screw, measured axially, or the distance that a screw will advance into a nut during one revolution; the term applies to the screw-propeller, the propelling surface of which is helicoidal, being composed of fractions of two or more threads. The *pitch* of rivets, boiler-stays, and the teeth of wheels is the distance between centres; in the latter case it includes a tooth and a space.

Tar and coarse resin boiled to a fluid yet tenacious consistence. It is used in a hot state with oakum to fill the chinks or intervals between the planks of a vessel.

PITCH-BOAT. A vessel fitted for boiling pitch in, which should be veered astern of the one being calked.

PITCH-CIRCLE. The circle on which the teeth of a wheel are laid out, and the rolling action of which would be equivalent to that of the wheel itself; the angular velocity ratio of two wheels working together is the same as that of their pitch-circles rolling in contact.

PITCH-MOP. The implement with which the hot pitch is laid on to ship's sides and perpendicular work.

PITCH-PINE. *Pinus resinosa*, commonly called Norway or red pine.

Pitching. The plunging of a ship's head in a sea-way; the vertical vibration which her length makes about her centre of gravity,—a very straining motion.

Pit-fish. A small fish found in the Indian seas, which has the power of protruding or retracting its eyes.

Pit-pan. A flat-bottomed, trough-like canoe, used in the Spanish Main and in the West Indies.

Pit-powder. Powder made with charcoal which has been burned in pits, not in cylinders.

Pivot-bolt. A bolt confining either end of the slide of a pivot-gun to the deck. One of the bolts being removed, horizontal motion can be given, the other bolt acting as the axis.

Pivot-gun. A gun capable of being fired on either side of the ship, the after part of the slide being confined to the deck by a pivot-bolt.

Pizarro, Francisco, the conqueror of Peru, was an illegitimate son of Gonzalo Pizarro, a colonel of infantry. He was born at Truxillo, in Estremadura, Spain, about 1471. In his youth he was a swineherd, but abandoning this uncongenial occupation, he went to the port of Seville and there embarked to seek his fortune in the New World. He was in Hispaniola in 1510; afterwards joined Balboa, and was with him when he crossed the Isthmus of Panama. In 1515 he was principally engaged in traffic with the natives on the shores of the Pacific Ocean. Hearing of the splendid achievements of Cortez, and rumors of the existence of a very rich country in the south reaching him, he formed a copartnership with Diego de Almagro and Hernando Luque, and the three fitted out a small expedition, with Pizarro in command. In November, 1524, he set sail, but got no farther than Quemada Point. On his second expedition he discovered Peru, but returned to Panama for volunteers to conquer the country; failing to do so here, he returned in 1528 to Spain, and by his graphic descriptions of the wealth of the new territory he secured from Charles V. the right of the discovery and conquest of Peru, and various honorable titles, such as governor and captain-general of Peru. On his side he agreed to raise a certain number of followers, and to give to the crown of Spain one-fifth of all treasures he should obtain. He returned to Panama, and with a small but well-equipped force of 180 men he conquered and made the empire of Peru his own. His conquest of Peru is a drama in every act of which there is bloodshed, and the final act (June 26, 1541), in which he and his group of followers fell the victims of a conspiracy, shows the drama to have been consistent to the end.

Pizarro, Gonzalo, like his brother, was also illegitimate. He was a soldier at an early age, and distinguished himself by his skill in martial exercises; and when he joined his brother's expedition, in 1528, to Peru, he was considered the best lance in the troop. The territory of Quito was assigned to him by his brother, and he was enjoined to explore the land to the east. He started on his famous journey in 1540, at the head of 350 Spaniards and a great number of Indians. They reached and crossed the Andes, losing a great many lives, the cold rendering many of them helpless. On the eastern side of the Andes they discovered the Land of Cinnamon. Hearing of a land of gold 10 days distant, they resolved to go there. After the greatest difficulties, and nearly starving to death, they reached the Napo, an affluent of the Amazon. Here Pizarro caused a rude bark to be constructed to transport the baggage and sick travelers, and intrusted Francisco de Orellana with the command of the vessel, and ordered him to proceed to the confluence of the Napo and Amazon, where a rich nation was supposed to live, and to obtain supplies from them and return to him. Orellana reached the Amazon, but, unable to obtain supplies or return against the current, he sailed down the Amazon to the Atlantic, and, strange to say, was successful in reaching Spain. Pizarro, after waiting in vain for the return of the bark, returned to Quito, where he arrived in 1542, after an absence of two years, the hero of an expedition which stands unrivaled in the annals of American discovery for its dangers and sufferings, and for the heroic fortitude with which they were endured. After the death of Francisco, Gonzalo became captain-general of Peru, and he was afterwards defeated in battle and executed by Pedro de la Gasca, who had been invested with the powers of sovereign by the king of Spain.

Place. The *place* of a heavenly body is the point on the celestial sphere to which it is referred by a spectator; when the spectator is supposed to be at the centre of the earth, this point is called the *geocentric* place; when at the centre of the sun, the *heliocentric* place. The *apparent* place is the point to which a heavenly body is referred by a spectator on the surface of the earth, viewing it through the atmosphere; the *true* place is the point to which it would be referred by a spec-

tator at the centre of the earth, viewing it through a uniform medium. The apparent place is determined by observation; the true place is obtained by applying to the apparent place the corrections for parallax and refraction. These corrections are greatest when the body is in the horizon, and decrease as it approaches the zenith.

Places of Call. Merchantmen must here attend to two general rules: if these places of call are enumerated in the charter-party, then they must be taken in the order laid down; but if leave be given to call at all, or any, then they must be taken in their geographical sequence.

Plaice, or Plaise. A fish of the genus *Platessa* (*Pleuronectes* of Linnæus), allied to the flounder, and growing to the size of 8 or 10 pounds or more.

Plan. A perfect outline of the ship to be built. There are three principal plans, viz., the *sheer*, *half-breadth*, and the *body-plan*, besides which there are deck-plans, and plans of such details as are necessarily used in the construction. The *sheer-plan* shows the sheer of the ship, shape or outline of the head, stern, and keel; when drawn in sections, as it usually is, it shows the heights of all the decks and the general arrangement of all the rooms in profile; it also shows the section-lines, the location and rake of the masts and bowsprit, the location of the frames, keelson, deadwood, air-ports, scuppers, chain-plates, etc. The rudder and propeller in elevation, and all vertical objects coming into the design, are shown in the sheer-plan. The *half-breadth plan* shows the outline or shape of the rail, plank-sheer, water-lines, diagonal lines, and ribband-lines in half breadth, and the location of the frames and section-lines. The *body-plan* shows the shapes of the frames or the vertical sections, as well as the cants; and all other frame-lines are drawn to their shape in the body-plan; it has the water-lines, section-lines, sheer-lines, and diagonal lines drawn upon it. The *deck-plan* shows the general arrangement of the hatches, beams, knees, and houses to be placed upon the deck; it gives the horizontal outline.

Plane Sailing. The method of calculating the position of a ship and the course to be steered, which is founded on the supposition that the surface of the earth is a plane. The method is simple and easy when compared with *spherical* sailing, and the term *plane sailing* has come to denote anything that is easy of accomplishment. It is frequently improperly written *plain* sailing. See NAVIGATION.

Planets (Gr. *astēr planētēs*, a wandering star, from *planān*, to wander). This term originally described all the heavenly bodies which were observed to change their place on the celestial sphere, in contradistinction to those whose position appeared to be fixed. The word, however, is now technically restricted to indicate those moving bodies of a character similar to our own globe, which revolve in orbits about the sun of our system. They shine by the reflection of light received from the sun. The principal planets, in the order of their distances from the sun, with their symbols, are Mercury ☿, Venus ♀ (the Earth ⊖, ⊕, or ♁), Mars ♂, ... Jupiter ♃, Saturn, ♄, Uranus ♅, Neptune ♆. Besides these, near to the sun is a small planet named Vulcan, and between Mars and Jupiter is a group of minute planets, called the *asteroids*, *planetoids*, or *minor planets*. The paths of the principal planets are in planes making a small angle with the plane of the ecliptic.

To the practical navigator the actual dimensions and movements of the planets are not so important as the conspicuous phenomena they exhibit. Four of them—Venus, Mars, Jupiter, and Saturn—are remarkably large and brilliant bodies, and of great importance in the problems of navigation; another, Mercury, is also visible to the naked eye as a large star, but by reason of its propinquity to the sun, is seldom conspicuous; Uranus is barely discernible without a telescope; the rest are never visible to the naked eye. Observations of Venus and Jupiter may often be obtained in the daylight, even when the planets are invisible to the naked eye. In such cases their meridian altitude may sometimes be observed with advantage. It is first approximately computed,—the corrections for refraction, dip, and index-error being applied reversely; this angle is then set on the sextant, the inverting telescope being screwed close down to the plane of the instrument. The image of the planet will be by this means detected near the N. or S. point of the horizon, and, once found, its meridian altitude may be accurately observed. These two planets are seen very distinctly during twilight, and this is the best time for observing them, for then the horizon is in general clearly visible and strongly marked. The four planets, Venus, Mars, Jupiter, and Saturn, are used for determining the longitude by the method of "lunar distances." It is, therefore, important to know how to identify these bodies. They are collectively distinguished from the fixed stars by their shining with a steady light, instead of twinkling. By reason of their proper motion they are continually shifting their place, and cannot be connected by imaginary lines with other heavenly bodies, as in the case of the fixed stars. Their positions may be found by referring to the Nautical Almanac, which gives their right ascension, declination, and time of Greenwich meridian passage. The appearance of the body may also help to distinguish it; Venus has a bluish light, while Mars is of a red color. For further information, see under proper heads.

PLANETS, INFERIOR AND SUPERIOR. Those planets whose orbits are within that of the earth are called *inferior* planets; those whose orbits are without, *superior* planets. The inferior planets are Vulcan, Mercury, and Venus; the superior planets are Mars, the asteroids, Jupiter, Saturn, Uranus, and Neptune.

PLANETS, PRIMARY AND SECONDARY. In the solar system there are about 20 moons or satellites; these are sometimes called *secondary* planets, the bodies about which they revolve being distinguished as *primary* planets.

PLANETS, INNER AND OUTER GROUP OF. The planets whose orbits are within the asteroids are designated as the *inner* group, the others the *outer* group.

PLANETS, MINOR. As soon as the planetary distances were determined, astronomers saw that to the orbit of Mars distances increase in a somewhat regular order, and that between Mars and Jupiter a wide gap destroys the symmetry otherwise apparent. Kepler suggested that a new planet might be found in this space.

Titius, of Wittenberg, sought for a simple

series of numbers which should represent the relative distances of the planets from the sun. After many trials he took the series—

0, 3, 6, 12, 24, 48, 96, etc.,

in which each term after the second is twice the preceding term; adding 4 to each number he found numbers which indicate very nearly the relative distances, thus:

Mer.	Ven.	Earth.	Mars.	——	Jup.	Sat.
4,	7,	10,	16,	28,	52,	100, etc.

When Herschel discovered Uranus, its distance was found to correspond to the next number, 196; but a planet was still wanting whose distance should answer to the number 28. The series of Titius was reproduced by Bodé, and was long known as *Bodé's law*.

By the series the distance of Neptune should correspond to the number 388; it is 300, and here the law fails. The gap at 28 has been filled by the discovery of a number of small bodies, the largest of which is but 300 miles in diameter. The first was discovered in 1801, but they now number more than a hundred, and they are called *asteroids* (star-like), *planetoids* (planet-like), and *minor planets*. They are invisible to the naked eye, and are known to be planets only by their motion; their orbits are very eccentric, much inclined to the ecliptic, and are included in a broad ring at a mean distance of 254 millions of miles from the sun. It has been suggested that they are the fragments of a planet shattered by an explosion, or broken in pieces by collision with a comet. The nebular theory supposes that the planets were formed originally by the gathering of matter collected by gravitation; that while the matter in the case of Mars and Jupiter concentrated about one nucleus, that which formed the minor planets gathered about many centres, and that these small bodies take the place of the one large body which might have been formed had all been compacted into one. The discoverers of minor planets assigned to them the names of mythological goddesses. They are also designated by numbers denoting the order of their discovery; thus, Ceres is (1), Psyche (16), etc.

Plank. A broad piece of timber from 1½ to 8 inches in thickness. *To plank it*, to sleep on the bare deck; to walk the deck.

PLANKING. The planks used in covering the frame of a ship. The act of covering the frame of a ship with plank.

PLANKING-CLAMP. An iron tool made for the purpose of drawing plank up to the timbers. It is a thin bar of iron bent so as to be open upon one side. On one end of this bar is fixed a point or claw for insertion into the timber, on the other end is a powerful screw having a lever attached to the outer end.

PLANK-SHEER. The pieces of plank laid horizontally over the timber-heads at the top-heights for the purpose of covering the top of the sides. It is sometimes called the *covering-boards*.

Plant. The machinery, fixtures, etc., by which a business or manufacture is carried on.

Planter. A large snag in a river, the upper end of which is below the surface of the water. In Newfoundland, a person engaged in the fishery.

Platanist. A fish of the genus *Delphinus* (*D. Gangeticus* of Cuvier); a species of dolphin found in the Ganges.

Play. Scope; swing; freedom of movement to a certain extent. *Tp play*, to put in action. *In play*, in action.

Playte. An old term for a river-boat.

Plebe. A fourth classman at the naval or military academy.

Plectognathi. An order of fishes having the maxillary bones stiffly adhering to the sides of the intermaxillaries, which alone form the jaws, as the file-fish. Written also *plectognaths*.

Pledget. A string of oakum used in calking.

Pleiades. A noted cluster of stars in the neck of Taurus. Six stars may be easily counted, and some persons distinguish as many as 12 or 14. The telescope shows about 100. The largest star, Alcyone, is near the ecliptic. Certain theorists have supposed that the centre of the universe is in this star, and that the solar and stellar systems revolve about it. The Greeks called this group the Pleiades (*plein*, to sail), because it was visible during the months when the Mediterranean was navigable without danger.

Pleny Tides. Full tides.

Plesiosaurus (Gr. *plēsios*, near; *sauros*, a lizard). A genus of fossil sea-reptiles, the remains of which are found in the Lias, Oolite, and Cretaceous measures. Its remarkable character may be inferred from the description of it given by Buckland, as follows: "To the head of a lizard it united the teeth of a crocodile, a neck of enormous length, resembling the body of a serpent, a trunk and tail having the proportions of an ordinary quadruped, the ribs of a chameleon, and the paddles of a whale."

Plicatiles. Ancient vessels built of wood and leather, which could be taken to pieces and carried by land.

Plot. To delineate, to mark down; as, to plot a ship's position.

Plucker. The fishing frog, *Lophius piscatorius*.

Plug. An implement for stopping leaky boiler tubes. The revolving part of a gauge-cock. A piece of metallic alloy which fuses at a low temperature, placed in the bottom of a boiler to melt and let the water run out in case the boiler is overheated. Any conical piece of wood to fit in an orifice. See SHOT-PLUG.

PLUG-HOLE. A hole in the bottom of a boat for convenience in letting out water; the plug is taken out when the boat is hoisted, and put in before lowering.

Plug-rod. A rod from the beam of an engine to work the air-pump, and sometimes communicates motion to the valve-gear; the term is not now in common use.

Plumb. Vertical; perpendicular.

Plumber-block, or Pillow-block. That portion of the engine frame supporting the main-journals, and containing the brasses.

Plummer-block. An adjustable pillow-block.

Plunger. A long, solid, or hollow cylinder, employed as a piston in force-pumps; its action is by displacement entirely.

Plunging Fire. A pitching discharge of shot from a higher level, at such an angle that the shot do not ricochet.

Ply. To work to windward; to beat.

Plymouth. A naval station and seaport town

of England, in the county of Devon, between the rivers Plym and Tamar, at the head of Plymouth Sound. The principal buildings in the town are the royal hotel, royal union baths, custom-house, barracks, hospitals, etc. The structures connected with the naval establishments are outside the town. The principal dock-yard is at Devonport. In it is an observatory. The naval and royal military hospitals, the victualing-yard, the gun-wharf, and the military prison, are all fine stone edifices. The harbor of Plymouth is double, consisting of the mouth of the Tamar and the estuary of the Plym. The parts of the port appropriated to the mercantile shipping are called Sutton Pool and Mill Bay, and in the latter are extensive wet-docks. The city has a large trade, and imports from the West Indies, North America, and the Baltic. It has also manufactures of glass, soap, starch, etc., and extensive fisheries. Pop. 69,000.

Pochard (*Fuligula*). A genus of oceanic ducks, the species of which are numerous, some of them are natives of the Arctic regions; some are found, at least in winter, on the coasts of Europe, Asia, and North America, and some in the southern hemisphere. The bill of the pochard is about equal in length to the head, and is broad and flat, a little dilated toward the tip, the lamellæ of the upper mandible not projecting beyond the margin; the wings are short, and the tail short and rounded. The windpipe of the male in all the pochards terminates in a labyrinth composed partly of bone and partly of membrane. The canvas-back duck is a species of pochard.

Pocket. A bight on the coast in which ships are likely to be detained by head winds.

Pod. A company of seals or sea-elephants.

Podiceps. Synonymous with *grebe* (which see).

Poggie. The miller's thumb, *Cottus cataphractus.*

Pogonias. See DRUM-FISH.

Pohagen. A fish of the herring kind; called also *hard-head.*

Point. A low spit of land projecting into the sea. *To point a gun*, to direct it at the target. *To point a rope*, to unlay, taper, and weave some of the outside yarns of the end of a rope,—for neatness, to prevent fagging out, and for convenience in reeving through a block. See COMPASS, REEF-POINT.

Point-blank. The term *point-blank* originated when it was supposed that a shot traveled for a certain distance in a straight line. The French define the point-blank as the second point at which the line of sight intersects the trajectory; the distance of this point from the muzzle is the *point-blank range.* The *natural* point-blank corresponds to the natural line of sight; all others are *artificial* points-blank. With us, as in England, the point-blank range is the distance from the muzzle to the point at which the projectile first strikes the horizontal plane on which the trucks of the carriage rest, the gun being laid level.

Point De Galle Canoe. A canoe consisting of a single stem of *Dúp* wood, 18 to 30 feet long, from 1½ to 2½ feet broad, and from 2 to 3 feet deep. It is fitted with a balance-log at the ends of two bamboo outriggers, having the mast, yard, and sail secured together, and when sailing is managed in a similar way to the catamaran. They sail very well in strong winds, and are also used by the natives of the Eastern Archipelago, especially at the Feejee group, where they are very large.

Pointer-board. An old contrivance for training a ship's guns.

Pointers. The two stars α and β *Ursæ Majoris* are called the *pointers* because they point out Polaris, which lies about as far from α as α does from η, the extreme star in the tail of the Great Bear.

Polacre. A ship or brig of the Mediterranean. The masts are commonly formed of one spar from truck to heel, so that they have neither tops nor cross-trees; neither have they any foot-ropes to their upper yards, because the men stand upon the topsail-yards to loose and furl the topgallant-sails, and upon the lower yards to loose, reef, or furl the topsails, all the yards being lowered sufficiently for that purpose. Written also *polacca.*

Polar. Pertaining to, surrounding, or proceeding from, the pole.

POLAR ANGLE. On the terrestrial sphere, the angle at the pole formed by two meridians; on the celestial sphere, the angle at the pole formed by two hour-circles.

POLAR AXIS. The axis of an astronomical instrument, as an equatorial, which is parallel to the axis of the earth.

POLAR CIRCLES. The two parallels of latitude which are at a distance of 23° 28′ from the poles; they separate the frigid from the temperate zones. The northern is called the *arctic*, and the southern the *antarctic* circle.

POLAR CO-ORDINATES. See CO-ORDINATES.

POLAR DISTANCE. The angular distance from the elevated pole,—the complement of the declination.

POLAR EXPLORATION. The list of explorers in the Antarctic regions may be reckoned up upon the fingers, while Arctic exploration has called forth the energies of stout hearts and active minds for more than a thousand years. After the discovery of the sea-routes to the Pacific and Indian Oceans, by the way of Cape Horn and the Cape of Good Hope, there was no practical object to be gained in pushing for the south pole, while exploration in that direction is attended by greater difficulties and infinitely greater dangers than in the Boreal region. Expeditions to the south have therefore been undertaken purely in the interests of science, and not, as was long the case with northern exploration, in hopes of finding a short cut to the Indies, and to wealth.

The Arctic regions were probably visited by Norse walrus-hunters long before the historical period, but the first record of such visits dates back to the 9th century. The voyage of Other, or Octher, around the North Cape, has for ages been celebrated in song and story. In the 10th century, Eric the Red visited Southeastern Greenland, and founded a settlement there. In the 14th century two Italian navigators are supposed to have penetrated within the Arctic circle, and Columbus is supposed to have visited the seas of Iceland and Greenland 15 years before his discovery of America.

During the 16th century the Dutch, English, and other northern nations promoted discovery in the far north, with a view to a free and speedy passage to China and India. The discovery by

Columbus and succeeding navigators of the great western continent, and the success of Vasco de Gama in finding a way to India by the Cape of Good Hope, stimulated commerce and exploration. The claim of Spain and Portugal to the exclusive right of navigation and trade with the countries discovered by them, forced upon the northern nations the importance of discovering a northwestern passage to prevent a ruinous decline of their commerce, and maritime supremacy. Theoretically, nothing appeared more likely than that such a passage existed, and Magalhaen's discovery of the strait bearing his name was adduced by many as a reason why a corresponding passage should exist at the north. Cabot therefore made voyages in search of it, in 1495, 1497, and in 1502. Cortoreale did the same in 1500, and in 1501. Then followed Verazzano, Gomez, Rut, Cartier, and Frobisher,—so that, by the year 1578, the contour of Newfoundland, and of the North American coast, up to the Arctic circle, became tolerably well known.

In 1553, Sir Hugh Willoughby and Chancellor had also penetrated to the northeast, and had reached Nova Zembla; Willoughby and a portion of his followers losing their lives in the undertaking. Burroughs tried to the northeast in 1556, and added notably to the knowledge of those regions. Other English explorers followed him in the same direction. In 1594 a Dutch expedition, under Barentz, visited Nova Zembla and the Eastern Arctic, and the same leader sailed again in this direction in 1595 and 1597,—the leader in the last voyage losing his life on the return from Nova Zembla, where he had lost his vessel and had been obliged to winter. Some of his men reached home by way of Lapland, after untold suffering, and the hut in which they wintered was found, intact, by some voyagers in 1871.

The ill success of the attempts to the eastward finally drew the attention of the English to the possibility of crossing near the pole, the idea being suggested by the fact that fishermen and whalemen were able, generally, to penetrate the mysterious icy region farther in that direction than any other. Henry Hudson was sent by the Muscovy Company, in 1607, with instructions to follow this general line. He reached 81° N. lat., to the eastward of Spitzbergen, but was then obliged to return. In 1610 the same company sent out Poole—who only succeeded in reaching 77° N.—to the westward of Spitzbergen. Marmaduke about the same time is said to have penetrated north of Spitzbergen, to 82° N. lat. In 1614 and 1615, Fotherby made attempts in the same direction, which came to naught. From this time, with the exception of an abortive voyage of Capt. Wood, in 1676, the English appear to have abandoned all attempts to reach the north pole in that direction for 150 years.

Interest in the northwest passage was heightened by failure to advance toward the northeast. All the very early explorations had been undertaken under the belief that there was a short passage to the northwest, if it could only be found. Interest in the northwest had been revived in 1585, when some London merchants sent out John Davis, who followed the west coast of Greenland, discovered the strait which bears his name, as well as Cumberland Island, and, in a subsequent expedition, reached lat. 72° N. The Muscovy Company also sent expeditions in this direction in 1602 and 1606, which did not succeed in reaching as high a point as Davis had done.

Hudson, then in Dutch employ, searched for the northwest passage in 1608. He followed the American coast, and, in the course of his voyage, discovered the great river which bears his name. Two years afterward—this time in the English service—he discovered Hudson's Strait and Hudson's Bay. In the middle of this great sheet of water he found his fate, being, in consequence of a mutiny, set adrift to perish. The English continued to send expeditions to the north and northwest. Sir Thomas Button sailed in 1612, Gibbons in 1614, and Baffin in 1615. Important discoveries resulted. Baffin's Bay, the strait between Cumberland Island and the continent, and Horn, Lancaster, and Smith Sounds were all mapped; but, having found no passage, the English efforts in that direction now relaxed for some years.

Denmark, however, sent Jens Munk in 1619; and in 1631 the English renewed their attempts, which were continued in 1641 and 1646. These made known Southampton Island, Fox Channel, James Bay, Wager River, and Repulse Bay. The northern coast of Asia was explored by the Russians, who also discovered the Liakhov Islands and Wrangel's Land. By the middle of the 16th century Russian navigators, in small vessels, were traversing the Arctic, where it washed the shores of Siberia, and very numerous subsequent expeditions have been sent forth by that nation in that region, under Behring, Kotzebue, Liakhov, Wrangel, and other well-known names; their efforts continuing from 1610 to the present day. Our own territory of Alaska and the Aleutian Islands were discovered by Behring, who was engaged for many years in northern exploration, in which he eventually lost his life. Tchirikow was also a noted explorer, about 1740.

In 1773 an English expedition, in the "Carcass" and "Racehorse," was sent to Spitzbergen, in which Nelson participated, with the rating of coxswain.

Capt. Cook, in addition to his other achievements, has also connected his name indelibly with the northwest of America and Behring's Strait. England renewed the search for the northwest passage in 1818, under Sir John Ross, and continued it, under various celebrated men, until its discovery, in 1850, by Sir Robert McClure. All these different expeditions, as well as those sent in search of Sir John Franklin, resulted in the discovery and naming of a vast number of geographical points between 60° and 130° W., and up to 77° N., and in 1833 Sir James Ross discovered the North Magnetic Pole. The expeditions to the north and northwest, succeeding Sir John Franklin's last one, undertaken in 1845, became so numerous that it is only possible here to name a few who have distinguished themselves, such as Sir James Ross, Kellett, Collinson, McClure, Austin, Ommancy, Sherard, Osborne, Sir John Ross, Penny, Forsyth, Snow, McClintock, Inglefield, Belcher, Young, and other Englishmen; De Haven, Kane, Hayes, and Hall, Americans; while Koldewey, Lamont, Peyer, and Weyprecht followed the course to the north of Spitzbergen with great

success. To the north of our own continent some gallant land travelers have ventured, in a constant struggle with cold and privation extending, in some cases, over years.

Sir John Franklin himself, when a lieutenant, started from York Factory, in 1819, to proceed to the Arctic shore and explore eastward from the Coppermine River. He was accompanied by Doctor (afterwards Sir John) Richardson, Messrs. Hood and Back, midshipmen, and a seaman named Hepburn. They were occupied about 3 years, traveled 5500 miles, and failed to accomplish very much, suffering such extremities of cold and hunger that their preservation was a miracle.

Franklin made another land journey in 1825, descending the Mackenzie River. Parry, in 1827, attempted to reach the pole to the eastward by sledging over the ice. He reached 82° 45′, but found the ice setting to the southward almost as fast as he traveled to the north, and was obliged to return.

Back, who had accompanied Franklin, and Dr. King made an Arctic land journey in 1833. Dease and Simpson journeyed north about the same time, and discovered what is now called Victoria Land, and a sea clear of ice.

Dr. John Rae, in 1846–47, proved the connection of Boothia with the mainland of America, and completed our knowledge of the formation of the land to the eastward. These were all in addition to extensive sledge journeys taken with ships as a base. At this writing, Lieut. Schwatka, of the U. S. army, has just returned from a marvelous journey of 3251 miles in the extreme north, during which the party was exposed to a cold of —71° Fahrenheit for many hours. They were nearly a year in accomplishing their journey, and started with only one month's provisions, living off the game killed, as the natives did. His discoveries only confirm the sad fate of the whole of Sir John Franklin's command.

The northwest passage discovered by McClure is between Bank's and Prince Albert's Lands, through Prince of Wales Strait, Melville Sound, Barrow Strait, and Lancaster Strait to Baffin's Bay, and is of no practical utility on account of its permanent obstruction by ice. Since its discovery, Polar exploration has had for its object scientific discoveries chiefly.

In 1854 the exploration of Dr. Kane, U. S. Navy, through Smith Sound and Kennedy Channel, revived the belief in an open Polar sea,—the Polynia of the Russians, which had been advocated for two centuries,—but this has not been confirmed by subsequent explorers, although his route, by Smith Sound, is now generally believed to be the most practicable one to the pole.

Dr. Petermann, the geographer, maintained that past experience pointed to the belief that the best course to the pole was that between Greenland and Spitzbergen, or to the eastward of Spitzbergen, and his opinion influenced late attempts in this direction by the Swedes, Germans, and Austrians, and by Mr. Lamont, an Englishman. These attempts have been abortive, and progress seems hopeless in that direction. Franz Josef Land was discovered by the Austrians, extending to 82° N., and the officers of that expedition saw nothing to warrant the belief in an open Polar sea. In 1871 the Norwegian Capt. Karlsen sailed round Nova Zembla for the first time. In 1872, Capt. Hall, of the United States, by way of Smith Sound, Kennedy Channel, and Robeson Channel, reached 82° 16′ N. lat. All these late expeditions gave important contributions to scientific knowledge.

Capt. Nares, of the English navy, in 1875, reached by sledge journey the highest northern point, Commander Markham in command of the party. The latitude was 83° 20′ 26″, and there was so little evidence of open sea there that he called the ice "paleocrystic."

In the present year Nordenskjöld, already celebrated for exploration of the Kara Sea, succeeded in pushing his way along the whole of the northern coast of Siberia, and in coming out safely into the Pacific Ocean, a feat which was believed impossible up to that time.

Lieut.-Commander De Long, U. S. Navy, in command of the "Jeannette," passed into the Arctic by way of Behring's Strait, in 1879, and has not since been heard of. His expedition was composed of the best material, and it is altogether likely that he will, in due time, report himself, with great additions to our knowledge of the northern regions.

The explorers of the Antarctic region have been few, there having been no practical object to serve after the discovery of the routes to the Pacific and the Indian Ocean, by way of Cape Horn and the Cape of Good Hope.

The name Antarctic should, strictly speaking, be applied only to the ice-bound sea to the south of the Arctic Circle. It is generally, however, extended to include more or less of the cold regions round the south pole, without reference to the Circle. As compared with the Arctic, little is known of it. It is clear that the dangers to navigation, and the cold, greatly exceed those of the north, and that human beings, and most terrestrial animals, have more difficulty in subsisting within its limits. Capt. Cook, in his voyages, entered the Antarctic at three points, and was the first to throw doubt upon the "Terra Australis Incognita," formerly laid down on all charts. Cook attained 71° 10′ S. on the 107th meridian. Bellinghausen, in 1821, sailed several degrees within the Circle, and discovered Alexander's Land. Howell saw Trinity Land in the same year. Palmer, an American, saw Palmer's Land, to the westward of Trinity, in lat. 62°. Weddell, an Englishman, saw no new land, but reached lat. 74° 15′ S. In 1831–32, Biscoe was sent out by Enderby, of London, and discovered Enderby's Land. Dumont d'Urville and some others made some unimportant attempts to the southward in 1833–38. In 1840, Dumont d'Urville (French) and Wilkes (American), in command of exploring expeditions, discovered what is probably a group of islands, in 61° S. and 160° E., although both reported a continuous coast.

The most important expedition to the Antarctic was made by Sir James Ross, in the "Erebus" and "Terror," in 1839–43. He penetrated to 78° 11′ S., the highest ever attained. He discovered land in 70° 41′ S. and 172° 30′ E. He also named several volcanoes and other mountains, and ascertained the position of the south magnetic pole to be 75° 5′ S. lat. and 154° 8′ E. lon. It was an extraordinary voyage, and full of perils, while the scientific results were very great. In 1845, Capt. Moore was sent by

the British Admiralty to observe magnetic phenomena in a region of the Antarctic not visited by Ross. He reached the 73d parallel with difficulty.

The two Polar regions differ widely. The Arctic seas teem with animal life, and land animals are comparatively plenty. There are many birds, and vegetation, such as mosses, lichens, scurvy-grass, small shrubs and flowers, are found in their appointed season, and in varieties unknown in the Antarctic. In the latter region vegetation ceases at a comparatively early limit. Trees and shrubs cease to exist in the south at 56°. There is plenty of animal life in the sea, but no quadrupeds on the land. Birds, however, exist in great numbers, and in varieties unknown in the Arctic. The Antarctic climate is more severe than that of the Arctic. Researches show that a luxuriant tropical or semi-tropical vegetation formerly existed in the Polar regions. Beds of coal have been found in the Arctic and in Kerguelen Land. Remains of large trees have also been found underlying basalt. Fossil remains of trees and animals, which now exist only in the tropics, have been found at Disco, Smith Sound, and New Siberia.

It is impossible here to go into the theories which account for this.

The voyage of the "Eira," containing Mr. Leigh Smith's Arctic explorers, details of whose observations in the Spitzbergen seas were given in the daily papers in the month of November, 1880, has been instrumental in elucidating the polynial character of that part of the Polar basin into which the North Atlantic discharges its warm floods. The "Eira" left England on June 22, and a week's steaming brought her to Jan Mayen Island, whence with leisurely movement she advanced toward Spitzbergen, clearing its South Cape on July 30. Up to this time nothing remarkable occurred to the explorers, except that they found the ice to the west of Spitzbergen in such quantities as to preclude progress in that direction. But pursuing their way to the northward they reached Franz Josef Land, discovered a new and well-sheltered harbor, and on their final trip, August 24, attained in their yacht the high latitude of 80° 20′ N. in longitude about 40° E. Since 1865, when Petermann's researches seemed to establish the extension of the Gulf Stream's thermal influence up to Spitzbergen, the Arctic waters in its vicinity have been invested with a peculiar interest, as possibly offering an advantageous approach toward the Pole. The polynias seen by so many polar voyagers between Spitzbergen and Nova Zembla and the readiness with which high latitude has been frequently made in this direction, apparently confirm the supposed Gulf Stream or Atlantic influence between these Arctic islands. "Our observations," says Payer, "proved the existence, in the Eastern Nova Zembla seas, of a band of warm water from 36 to 40 feet deep," and Middendorf and Mack found evidences of a warm water agency as far east as 60° and 81° E. lon. North of Spitzbergen, however, Parry found in 1827, as others more recently have, that the Polar stream is pressing its way southward. These facts point to the extension of the Atlantic drift movement far to the east of Nova Zembla, and even north of the New Siberian Islands, with the consequent formation of occasional polynias. Mr. Leigh Smith's late voyage did not extend so far east, but so far as it did extend it is confirmatory of Petermann's general conclusions as to the comparative openness of these waters.

The effect of a warm current on the pack-ice of high altitudes by no means insures a free passage for a ship, and it may, as Petermann believed, only make "a blind alley of ice." But where such a thermal agency is present Arctic travelers will be encouraged to conclude with Lieut. Payer, that "the hope of finding a navigable sea in latitudes not hitherto attained is not yet extinct." As it is possible the "Jeannette," should she have prosecuted her voyage to the northwest of Wrangel Land, may ultimately enter the seas contiguous to Franz Josef Land and Spitzbergen, she may supplement Mr. Leigh Smith's exploration.

Polar Forces. Forces that act in pairs with opposite tendencies or properties, as in magnetism, electricity, etc.

Polaris, or Pole-star. The name of the star *α Ursæ Minoris*, so called from its being the bright star which is nearest to the north pole of the heavens. Its Arabic name is *Ruccabah*, and it is also known as the *Cynosure* (from *kuōn*, *kunos*, a dog, and *oura*, the tail,—the constellation of Ursa Minor being anciently figured as a dog). Polaris can readily be found by the "Pointers" β and α Ursæ Majoris, being the first bright star which the line of their direction passes. α Ursæ Majoris (Dubhe) is at the same distance from the stars in the extremities of the two constellations the Great Bear and the Little Bear, the former being η Ursæ Majoris, and the latter α Ursæ Minoris, or Polaris. The star α Ursæ Minoris has not always been, and will not always continue to be, the pole-star. The precession of the equinoxes may be viewed as a very slow motion of the pole of the heavens among the stars in a small circle round the pole of the ecliptic. The effect of this is an apparent approach of some stars to the pole and recess of others. When the earliest catalogues were constructed, the present pole-star was 12° from the pole; it is now less than 1½°, and will approach to within ½°, when it will begin to recede and give place to others. Four thousand years ago *α Draconis* was the pole-star, and was but 10′ from the pole; after the lapse of 12,000 years, *α Lyræ*, the brightest star in the northern hemisphere, will be the pole-star, approaching to within about 5° of the pole. The present pole-star is calculated to be about 292 millions of millions of miles from the earth.

Poldavis, or Poldavy. A canvas from Dantzic, formerly much used. A kind of sail-cloth thus named was also formerly manufactured in Lancashire.

Pole-ax. A sort of hatchet, resembling a battle-ax, which was used on board ship to cut away the rigging of an adversary; and also, in boarding an enemy whose hull was more lofty than that of the boarders, by driving the points of several into her side, one above another, and thus forming a kind of scaling-ladder; hence were called boarding-axes.

Poles (Gr. *polos*, a pivot on which anything turns; the axis of the sphere). The points at the extremities of the axis of the celestial sphere, which in the diurnal revolution appear station-

ary, and about which the whole of the heavens appear to turn as upon pivots. This is the primary use of the term. Hence it is extended and applied to extremities of the axis of the earth; hence, also, its more purely geometric uses. The term is still further extended to physics; thus, when it was found that the magnet did not always point to the north pole, but to another point, this point was naturally named the magnetic pole. Also, the upper ends of the upper masts when they rise above the eyes of the rigging.

Pole-star. See POLARIS.

Policy. The written instrument that evidences the contract of insurance. (See MARINE INSURANCE.) In another sense it signifies a course of governmental administration or of individual action.

Poll. A fish, called also *chub* or *chevin*.

Pollack. The *Merlangus pollachius*, a well-known member of the cod family.

Pollard. The chub-fish.

Pollux. The star β *Geminorum*. See GEMINI.

Polyneme. A sea-fish of the genus *Polynemus*, characterized by having the ventral fins abdominal instead of thoracic.

Pomfret. A delicate sea-fish taken in great quantities in Bombay and Madras.

Pommelion. An old name for the knob on the breech of a cannon.

Ponches. Small bulk-heads made in the hold to stow corn, goods, etc.

Poncho. A blanket with a hole in the centre, large enough for the head to pass through, worn by natives of South and Western America.

Pond. A cant term for the ocean. *French pond*, the Mediterranean.

Pontones. Ancient square-built ferry-boats for passing rivers, as described by Cæsar and Aulus Gellius.

Pood. A Russian commercial weight, equal to 36 pounds.

Poop. A partial deck elevated above the spar-deck, and extending from the mizzen-mast aft. A vessel is *pooped* when, in running before a heavy sea, the waves break over the taffrail.

POOP-ROYAL. A short deck or platform formerly placed over the aftmost part of the poop in the largest of the French and Spanish men-of-war.

Poor, Charles H., Rear-Admiral U.S.N. Charles H. Poor was born at Cambridge, Mass., in June, 1809. Appointed midshipman from Massachusetts, March 1, 1823; attached to sloop-of-war "John Adams," West India Squadron, 1827; frigate "Java," Mediterranean Squadron, 1829.

Promoted to passed midshipman, March 29, 1829, and ordered to frigate "Delaware," Mediterranean Squadron, 1830; sloop-of-war "Lexington," Brazil Squadron, 1833, and brig "Boxer," same squadron, 1834.

Commissioned as lieutenant, December 31, 1833; rendezvous, Norfolk, Va., 1836; razee "Independence," Brazil Squadron, 1840; navy-yard, Washington, 1846–48; inspector, etc., 1850–51; frigate "St. Lawrence," Pacific Squadron, 1852–55.

Commissioned as commander, September 14, 1855; navy-yard, Norfolk, Va., 1856–58; commanding sloop-of-war "St. Louis," Home Squadron, 1860–61; commanded expedition of sailors and marines to reinforce Fort Pickens, 1861; frigate "Roanoke," North Atlantic Blockading Squadron, 1861–62. Commander Poor took command of steamer "Illinois," to act as a ram against the "Merrimac," but did not have an opportunity to test the power of his vessel. Passed rebel batteries, under fire, at Sewell's Point, while proceeding from Hampton Roads towards Newport News in frigate "Roanoke," to assist the "Congress" and "Cumberland."

Commissioned as commodore, January 2, 1863; commanding sloop-of-war "Saranac," Pacific Squadron, 1863–65; compelled the authorities at Aspinwall to release U. S. mail-steamer detained to collect illegal dues (approved by Secretary of the Navy); compelled authorities at Rio Hacha to hoist and salute the American flag, which had been insulted (approved by Secretary of the Navy); commanding Naval Station at Mound City, Ill., 1866–68.

Commissioned as rear-admiral, September 20, 1868; commandant navy-yard, Washington, 1869; commanding North Atlantic Squadron, 1869–70; member Retiring Board, 1871–72. Retired June 9, 1870.

Poor John. Hake-fish salted and dried, as well as dried stock-fish, and bad *baccalao*, or cod, equally cheap and coarse.

Popler. An old name for a sea-gull.

Poppets. The upright pieces which are fitted between the ship's bottom and the bilge-ways at the extreme ends of the ship, to support her in launching. Small pins on the gunwale of a boat to form a rowlock.

POPPET-RIBBANDS. Pieces of oak plank running across the poppets, fore-and-aft, to which they are secured.

POPPET-LASHING. Chain-cables passed around the poppets and over the poppet-ribbands, from side to side, to support the extremities of the vessel in launching.

Poppet-valve. A steam-valve made in the form of a frustrum of a cone, which acts by opening and closing a conical port; it receives its motion from a rock-shaft by means of a lifting-toe, working under a similar toe on the valve-stem; there are two kinds, the single- and double-poppet valve; the latter is a balanced valve.

Poppling. Sea-waves in irregular agitation.

Porbeagle. A kind of shark.

Porcupine-fish. A fish of the tropical seas, which is covered with spines or prickles capable of being erected by its inflating the body. It is the *Diodon hystrix* of Bloch.

Pores. Minute, dark spots on the sun.

Porgy. A salt-water fish of the gilt-head kind, much esteemed for food. The common species in North America is the *Pagrus argyrops*. The *sand-porgee* is the *Sargus arenosus*.

Porpoise (*Phocæna*). A genus of cetacea of the family *Delphinidæ*, having a form similar to the dolphins, but the muzzle short, uniformly convex, and without a beak; a dorsal fin; the teeth very numerous, simple, and equal. The grampus (which see) is generally referred to this genus.

Port. An opening from the steam-chest to the cylinder of a steam-engine; if for the admission of steam, it is termed the *induction*, or *steam-port;* if for the exhaust, it is termed the *eduction*, or *exhaust-port*.

An opening in the side of a ship-of-war through

which a gun is fired. *Cargo-ports* and *lumber-ports* are fitted in merchant ships for the purpose of receiving and discharging cargo and lumber.

A place of resort for vessels for commercial purposes. (See HARBOR.) A place more or less protected from the wind and sea, and used as a place of refuge for vessels in tempestuous weather. The left side of a vessel,—a term which has been substituted for the old word *larboard*, as being less likely to be mistaken for *starboard*.

PORT-BARS. Strong pieces of oak by which the ports are secured from flying open in a gale of wind, the bars resting against the inside of the ship; the port is first tightly closed by its hooks and ring-bolts.

PORT-CHARGES, or HARBOR-DUES. Charges levied on vessels resorting to a port.
